## INDEX OF CONTENTS.

JULY TO DECEMBER, 1888.

## A

*ABERIA caffra* (Kei Apple), 159  
*Abies Douglasii*, disease of, 215; in Scotland, 531, 568, 598; *A. magnifica*, 208  
*Abutilon vexillarium*, 696  
*Acacias*, 103; *A. decurrens*, 478  
*Acampe dentata*, 695  
*Achras sapota*, 478  
*Adelaide*, 215  
*Adiantum cydoniaefolia*, 696  
*Adiantum Farleyense*, 190; *A. mundulum*, 388  
*Aechmea fulgens*, 474  
*Aeranthus Curnowianus*, 210  
*Aesculus turbinata*, 675  
Africa, vegetables in, 7  
*Agapanthus umbellatus*, 661  
Agricultural lectures, 360; returns, 695  
Agriculture, Board of, 205; discovery in, 708  
Agri-Horticultural Council, an, 61  
Aikenhead, 66  
*Aleurites moluccana*, 67  
*Allamanda Hendersoni*, 387  
*Allium narcissiflorum*, 70; *A. parviflorum*, 236; *A. pedemontanum*, 70  
*Alocasias*, 705  
Alpine Garden, 13, 66  
*Aistromeris*, 210  
Aluminium in plants, 15  
Alyssum, 709  
*Amaryllis*, the, 12, 473; *A. reticulata*, 360  
American blight on Apples, 102  
American Florists, Society of, 188, 636  
American Notes, 40  
American Pomological Society, 44  
*Anagallis Philippii*, 445  
*Anchusa italica*, 104; *A. sempervirens*, 104  
*Anemones*, 706; Japanese, 391; *A. narcissiflora*, 39; *A. sylvestris*, 9; *A. vitifolia*, 9  
*Anguloa*, 390  
*Anigostanthus breviflorus*, 411  
*Ansellia africana*, 629  
*Antigonon leptopus*, 216  
*Apiary*, the, 40, 156, 216, 297, 355, 411, 503, 633, 698, 758  
Apple audit, an, 543  
Apple culture, 418  
Apple and Pear, enemies of the, 469  
Apple, Blenheim Orange, fruitful tree of, 302; Jacques Lebel, 391; White Paradise, 236  
Apples and Pears in Jersey, 443  
Apples and Pears, National Conference on. (See National Conference).  
Apples, certificated, at Chiswick, 577; for profit, 435; large and showy, 707; market, 736; Nova Scotian, 155, 741; stocks for, 336  
*Aquilegia*, 40; new hybrid, 179  
*Arachnanthe Clarkei*, 567; *A. Loweii*, 628  
*Aralia Sieboldii*, 707

*Araucaria brasiliensis*, 159  
*Araucaria albens*, 302; *A. graveolens*, 271  
Arbor Day, 243  
*Arbutus Andrachne* at Kew, 724  
Ardgowan, 332  
*Ardisia mamillata*, 766  
*Aristolochia Westlandi*, 186  
Art at Christmastide, 755  
*Arum Draucunculus*, 208  
*Arunchina bambusifolia*, 455, 628  
Ascot Nurseries, the, 301  
*Asparagus plumosus*, 473; *A. tenuissimus* in flower, 301, 335  
*Asters* at Chiswick, 217; hybrid, 515, 545  
*Athrotaxis*, 703  
*Athrotaxis selaginoides*, 544  
Auckland, horticulture at, 382  
*Auricula*, the, 67, 666  
*Auricula*, autumn flowering, 261  
Austin & McAslan's nurseries, 66  
Azalea, the, 12

## B

BACKHOUSE & SONS' nursery, 511  
Bananas in Nicaragua, 455  
Banks and slopes, treatment of, 607  
Banyan tree, the, 214  
Barley, experiments in hybridising, 633  
Barrow Point, Pinner, 416  
*Basella rubra*, 303  
*Batemannia Collei*, 236  
*Bauhinia tomentosa glabra*, 631  
Bean, Neal's Ne plus Ultra, 576, 741  
Beans (broad), weevil-eaten, 103; runner and kidney, 418; preserving notes from, 739  
Bedding out, 242  
*Befaria glauca*, 695  
*Begonia*, the, as a bedder, 134  
*Begonia Clarkei*, 576; *B. geranioides*, 501; *B. Scharffii*, 695; *B. socotrana*, 631; *B. Winter Gem*, 758  
*Begonias*, 604; at Laing's, 362  
Belgium, Grape growing in, 333; pomology in, 735  
Belton Park, Grantham, 506  
Belvoir Castle, Pears at, 705  
Berlin, flowers in, 479; horticultural exhibition at, 573; horticultural notes from, 16, 244  
*Bertolonia Comte* de Kerchove, 542  
Birmingham Gardeners' Association, 272  
Birmingham Horticultural Society, 762  
Blackberry, the Wilson Junior, 379  
Black canker of bulbs, 361  
Blythwood, 233  
Boiler, Milne's patent saddle, 161, 190; new horizontal tubular, 390  
Boissier's herbarium, 509, 607  
Books:—*Acacias* (Von Mueller), 103; all known Ferns (Yates), 732; Almanacs (various), 762; *Autour de mon Jardin* (Eugène de Daru), 134; Bee-keeping, Book of (W.

B. Webster), 17; *Begonias*, the, Tuberous (Ed. B. Wynne), 159, 533; Book of the Farm (J. Macdonald), 703; Botanical Magazine, 15, 186, 300, 415, 573, 670; *Botanische Zeitung*, 15; British Moss Flora (Braithwaite), 509; Chinese flora (Forbes & Hensley), 762; Familiar Trees (Cassell), 512; Farm, Field, and Fireside, 16; Ferns, Choice British, their Varieties and Culture (C. T. Drury), 103; Flora Orientalis, Supplement (Baser), 509; Flower Gardening for Amateurs (L. Castle), 103; Fodder Grasses of Northern India, 187; Forest Flora of Cochinchina (Pierre), 13; Forest Flora of South Australia (Brown), 12; Garden Oracle (S. Hibberd), 761; Gardeners' Magazine, 761; General Plantarum Index (Durand), 330; Handbook of Canada, 509; Indian Figs (Dr. King), 357; Journal of Botany, 734; Kew Bulletin, 15, 102, 186, 330, 387, 605; Life-lore, 16; *Medizinische Pflanzen* (Köhler's), 509; *Natürlichen Pflanzenfamilien*, 542; New Zealand, Native Flowers of (C. Hetley), 17, 637; Orchids of the Cape Peninsula (H. Bolus), 668; Origin of Floral Structures through Insect and other Agencies (Rev. G. Henslow), 14; Pansy, the (A. Lister), 103; Popular Educator (Cassell), 542; Principles of Agricultural Practice (J. Wrightson), 702; Producer and Consumer (Samuel Rawson), 361; *Reichenbachia*, 102, 509; Rose Garden (Paul), 735; Rothamsted Experiments, the (W. Fream, B.Sc.), 104; Trees of Commerce (W. Stevenson), 297; Tropical Agriculture, 132; Tropical Products (M. F. W. van Eeden), 132; Walks in Holland (P. Lindley), 762

Bordeaux, forest produce at, 10  
Borders, heated open-air, 363; wall fruit tree, 535, 545, 578, 642, 677  
Botanic gardens, Baden-Baden, 360; British Guiana, 387; Glasgow, 309; Glasnevin, 763; Saharanpur and Mussorie, 514; Saint Lucia, 238; Trinidad, 159; origin of, 243  
Botany and horticulture, 330  
Botany at the Universities, 605; for gardeners, 741  
Bouvardia President Cleveland, 274  
Bouvardias, 327  
Brambles, 331  
*Brassavola lineata*, 150  
*Brassia Keiliana trisris*, 411  
British Association, 300, 361; Professor Dyer's address at, 321, 351  
British Fruit Growers' Association, 390, 445  
Broccoli, Gilbert's Victoria, 47, 135  
Broccoli-Cauliflower late and early, 160

*Bromeliads*, 474, 661, 670, 735  
Broom root, Mexican fibre, 332  
*Browallia elata*, 179  
*Brownia grandiceps*, 73  
Bulb garden, the, 263, 388, 407, 504, 730, 764  
Bulb gardens of Haarlem, 7  
Bulbs, black canker of, 361  
Bulbs, Dutch, 133  
*Bulbophyllum Lobbii*, 9; *umbellatum*, 326  
Bull's nursery, 92, 360  
Bunt in Wheat, 72  
Bunyard, G., & Co.'s, nursery, 354  
*Buptharum salicifolium*, 269  
Burnley, gift of park to, 573

## C

CABBAGE competition, a, 66; Chou de Burghley, 333; new varieties, 334  
Cabbages, 107, 135, 246  
*Casalpinia japonica*, 513  
*Caladium esculentum*, 615  
*Calandrinia oppositifolia*, 601  
*Calceolaria*, 474  
*Callidium pygmaeum*, 640  
*Callistemon rigidus*, 661  
*Camellias* dropping buds, 740  
Canada, 509  
Canadian plants, 734  
*Canarina campanulata*, 695  
Canker, 439, 440; in Apples, 608; in bulbs, black, 361  
Cannell, H., & Sons' Nursery, 479  
Canterbury Bells, 72  
Cant's (Frank) nursery, 267  
Cape Orchids, 668  
*Carludovicia rotundifolia*, 631  
Carnation, a large, 16; *C. germanica*, 134; *C. Mrs. Reynolds Hole*, 215; *C. R. H. Elliott*, 13  
*Carnations*, 134, 135, 264, 706  
*Carnations* and *Picotees*, 67, 103, 666, 704  
*Carnations* at Chiswick, 573; border 447, 515; layering, 210  
Carrot, an extraordinary, 573  
Carter, J., & Co.'s nursery at St. Osyth, 597; Carter's Sick Fund, 671  
*Cassheara triphylla*, 501  
*Castle Wemyss*, 183  
Castor-oil, 338  
*Catalpas*, 189, 217  
*Catasetum Russellianum*, 326, 354; *C. tabulare* var. *serrulata*, 726  
*Cattleya Bowringiana*, 475, 534; *C. Dowiana aurea*, 628; *C. exoniensis* x, 727; *C. Hardyana*, 446; *C. Harrisoniae violacea*, 235; *C. Lawrenceana*, 236; *C. Loddigesii*, 326; *C. pumila*, 475; *C. Schroderae alba*, 94  
*Cauliflower*, early, 160; extra early, 67  
*Celosia pyramidalis plumosa*, 104  
*Centaurea aurea*, 274, 338  
*Centradenia rosea*, 513  
Certificates, 16

Chambre Syndicale of Ghent, 300, 331, 478, 605, 734  
 Cheilanthes, 630  
 Chemistry of vegetation in reference to the growth of the Potato, 89, 128, 150, 184, 207, 325, 481, 631, 697  
 Cherries, ancient record of, 606  
 Chironia pedunculata, 324  
 Chiswick, 536, 574, 607, 707; Apples certificated at, 577; Carnations at, 473; future of, 540; Gardeners' Mutual Improvement Association, 332, 510; Jensenian system of moulding Potatoes at, 630  
 Chiswick Horticultural Society, 761  
 Christmaside, art at, 755

 Chrysanthemums, annual, 391; at Chiswick, 606; at Ghent, 734; at Moor Park, Rickmansworth, 673; influence of wood-ripening on the buds and blooms of, 674; new, 703, 734; single, 608; on walls, 707  
 Cinchona in India, 238  
 Cineraria, 474  
 Cistus, the gum, 352  
 Clematis balcanica, 8; C. Jackmanni alba, 152, 190; flowers, leafy, 17; at Huntingdon, 324  
 Clerodendron nutans, 702  
 Clethra arborea, 570  
 Climate at Rothsay, 331  
 Clivia miniata, 661; hardness of, 72  
 Clovers, foreign, 327  
 Coal, anthracite, 766  
 Cockcombs as bedding plants, 40, 72  
 Cocoa-nut refuse, 762  
 Colognyne Gardueriana, 694; C. ocellata, 600; C. Massangeana, 694  
 Cold storage of fruit, 215, 244, 331  
 Cologne Exhibition, 44  
 Colonial notes, 194, 237, 382, 741  
 Colour in Apple blossom, deficiency of, 36  
 Cone fruit of Assyrian monuments, 243  
 Conference, National, on Apples and Pears (see National Conference)  
 Conference of fruit growers, 15, 242, 261, 289  
 Coniocybe pallida on Vines, 740  
 Conifers, measurements of, 208  
 Conifers, 327; exotic, at great altitudes, 478; growth of, 215; hybrid, 243; secretions of, 215  
 Convolvulus tenuissimus, 300  
 Coombe Wood, 666  
 Copenhagen fungus exhibition, 379  
 Copley Medal, the, 606  
 Coreopsis lanceolata, 238  
 Cork industry in Spain, 583, 702  
 Corydalis lutea, 210  
 Cosmos bipinnatus, 701  
 Costus speciosus, 236  
 Crataegus mexicana var. Carrierii, 736  
 Creeper on a house, 46  
 Crewe, the, at Kenilworth, 10  
 Crinum Powelli, 483  
 Crocosma aurea, 304, 327; var. maculata, 565  
 Crocus, 334, 730  
 Crops in Cornwall, 187  
 Crucifers, a few alpine, 709  
 Cryptochilus sanguinea, 36  
 Cucumber, Bibby's Seedling, 361; Thorburn's Everlasting, 362  
 Cucumbers, long-lived, 335, 447, 484, 545  
 Cultural memoranda, 68, 104, 133, 179, 210, 238, 267, 327, 352, 384, 570, 661, 703, 727  
 Cynas revolvens, 162  
 Cynchoches chlorochilton, 326  
 Cyclamens, 475; fringed, 642  
 Cyneniums, 384  
 Cydonia japonica Clemmosei, 666  
 Cyphers, Orchids at, 323  
 Cyphomandra betacea, 411  
 Cypresses, large deciduous, 273  
 Cyripedium Amesianum, 235; C. Fitchianum, 600; C. bellatulum, 215;

C. Miteaunum, 326; C. insigne Sanderia, 606; C. Parishii, 150; C. Stonei, 162  
 Cyripediums, high-priced, 510; at Low's, 739  
 Cyrtopodium Saintlegerianum, 180  
 Cytisus racemosus, 63, 163

## D

DAFFODILS, 159; and manures, 335; lifting and replanting, 11, 35, 63, 135, 189, 263, 303, 362, 504  
 Dahlia, the, 181; D. imperialis, 156  
 Dahlias, change of colour in, 363; changing colour, 392; from Rothsay, 543  
 Damping off of seedlings, 272  
 Daphne Mezereum autumnalis, 666  
 Decorations, new horticultural, 756  
 Delphinium Zaili, 63  
 Delphiniums, 133, 159; newer varieties of, 134  
 Dendrobium Colognyne, 663; D. macrophyllum, 235; D. primum, 727; D. sphegdoglossum, 179; D. Wardianum, a large piece of, 8  
 Devil's coach-horse, 216  
 Devizes Castle, 243; sale of, 215  
 Devonhurst, Chiswick, 726  
 Devon Rosery Gardeners' Relief Fund, 700  
 Devonshire gardens, 765  
 Dianthus Segueri, 576  
 Dickson & Son's nursery, 512  
 Dickson's, H., nursery, 512  
 Dicksons (Limited), 244  
 Dictamnus fraxinella, 352  
 Dielytra spectabilis, 727  
 Diospyros virginiana, 504  
 Dipladenia Brearleyana, 134  
 Disa culture, 693  
 Disa graminifolia, 215; D. (grandiflora) uniflora, 695; D. lacera and D. l. var. multifida, 664, 701, 707  
 Disbudding Roses, a protest against, 38  
 Disease of Abies Douglasii, 215; of Apples, 470; of bulbs, 361; of Hellebores, 16; of Lilies, 184, 577; of Mangels, 274; of Ornithogalum, 104, 135; of Potatoes and Mangels, 274; of Tomato and Potato, 330; of Vine roots, 740; of Wheat, 72  
 Dobbie & Co.'s nursery, 640  
 Doodias, 710  
 Doronicum plantagineum excelsum, 570  
 Douglas Fir, disease of, 215; in Scotland, 531, 563, 598  
 Draba, 710  
 Draena fragrans var. Lindeni, 662  
 Dragon trees in Madeira, 444  
 Droppers of Tulipa sylvestris, 241  
 Duncour, P. L., 605  
 Dyer's, Professor, address at the British Association, 321, 331

## E

EALING, Royal visit to, 734  
 Echeveria retusa, 741  
 Echinocactus Haselbergii, 186  
 Edge Hall, notes from, 160  
 Edinburgh Botanic Gardens and the Scottish Horticultural Association, 137  
 Eel-worms, 636  
 Eichornia paniculata, 36; E. tricolor, 236  
 Embotrium coccineum, 8; raising of, from seed, 133  
 Emigrants' information, 415  
 English Apple and Fruit-growing Company, Limited, 361  
 English gardening, early, 121, 177, 377  
 Enkianthus himalaicus, 16  
 Epidendrum nemorale, 150; E. tam-pense, 150; E. verrucosum, 150  
 Epilobium angustifolium, 180

Epiphyllum salmoneum, 210  
 Erigeron alpinus, 209  
 Escallonia macrantha, 703  
 Eucalyptus globulus flowering, 133; E. (lemon-scented), 478; E. viminalis, 596  
 Eucharis amazonica, 274, 762  
 Eupatoriums, 327  
 Eurycles, 212; E. australasica, 727  
 Exhibitions, early summer, 38; international, 707

## F

FARFOTUM grande, 570  
 Felixstowe, gardening at, 239  
 Ferns at the Royal Horticultural Society, 484  
 Ficus Roxburghii in Calcutta, 698  
 Field crops, our, 214  
 Figs in the open air, 766  
 Finsbury Park, Chrysanthemums at, 544  
 Fir, the Douglas, disease of, 215  
 Fir, the Douglas, in Scotland, 531, 568, 598  
 Fish, Mr. D. T., 542  
 Floral Design, 671  
 Flora of Madagascar, 361  
 Florists' flowers, 12, 67, 134, 180, 264, 446, 473, 666, 767  
 Flower garden, 41, 69, 94, 129, 157, 169, 213, 241, 290, 334, 385, 413, 475, 510, 539, 603, 667, 731, 758  
 Flower holder, Chisel's, 334  
 Flower trade, the, 606  
 Flowers and insects, 413  
 Flowers for the working classes, 416  
 Flowers, why and what they are, 14  
 Fog, effect of, on flowers, 739  
 Forage plant, a new, 387  
 Forbidden fruit, the, 732  
 Foreign correspondence, 39, 244, 273, 479, 675, 709, 741  
 Foreign grasses and clovers, 327  
 Forest management in Germany, 243; produce at Bordeaux, 10  
 Forestry, 40, 99, 185, 216, 240, 298, 356, 510, 634, 730; in Guiana, 156  
 Forsteria gracilis, 387  
 Foxgloves, 104; cup-shaped, 151  
 France, Pine forests of western, 58  
 Freesia from seed, 104, 407  
 Fremontia californica, 298  
 Frost, the late, 418  
 Fruit and vegetables in Jersey, 33  
 Fruit, cold storage of, 215, 244, 331  
 Fruit conference at Dunkeld, 277  
 Fruit Conference, the National (see National Conference)  
 Fruit crops of 1888, 100; remarks on, 122; at Worksop, 190; report on the condition of (tabulated), 95  
 Fruit culture, 270, 300; in Ireland, 445; for profit, 289; for profit in the open air in England, 436  
 Fruit distribution, 294  
 Fruit farming (Mr. Panch's), 575  
 Fruit farm, Lord Sudeley's, 293  
 Fruit Growers' Association, 334; Conference, 15, 242, 261, 289, 735  
 Fruit in New South Wales, 514  
 Fruit, Nova Scotian, 741  
 Fruit notes, 302  
 Fruit packing, 291  
 Fruit production and distribution, 467  
 Fruit register, 68, 161, 211, 236, 505, 539, 601, 705  
 Fruit, transit of, 130, 358  
 Fruit trees and moisture, 447; firm soil for, 707; hardy, 303; insects on, 729; transplanting, 418; wounds of, 250  
 Fruits under glass, 13, 41, 69, 129, 185, 216, 241, 269, 290, 329, 357, 385, 413, 454, 475, 507, 539, 571, 603, 635, 667, 699, 731, 759  
 Fruits, dried, 727  
 Fulham Palace, 5  
 Funchal, Madeira, the public garden at, 386  
 Fungus exhibition, Copenhagen, 379  
 Fungus foray in Sweden, 407; the

Hampshire, 482; the Woolhope, 480; the Yorkshire naturalists, 302, 420

#### PLANTS, NEW OR NOTWORTHY.—

*Aeranthus ophioclepton*, 91; *Aërides Houlettianum*, 378; *Aloe longiflora*, 756; *A. penduliflora*, 178; *Angreum tridactylites*, 34; *Bollea hemixantha*, 206; *Catasetum fuliginosum*, 473; *C. Garnettianum*, 692; *Cattleya Cassandra* x, 596; *C. flaveola* x, 473; *C. guatemalensis* var. *Wischhauseniana*, 378; *C. guttata Leopoldi odoratissima*, 378; *C. munda*, 378; *C. Harrisoniana* var. *Regnieriana*, 264; *C. intermedia Parthenia*, 178; *C. Krameriana*, 323; *C. labiata Gaskelliana*, 122; *C. l. G. alba*, 178; *G. l. Mossiae* var. *Peesteri*, 69; *C. porphyroplebia* x, 502; *C. Rochelensis*, 353; *Cleisostoma ringens*, 724; *Crocina aurea* var. *maculata*, 407; *Cynochos versicolor*, 569; *Cypripedium Atyx* x, 6; *C. bellatulum*, 122; *C. Barfordense* x, 724; *C. chelseense* x, 406; *C. concolor* var. *sulphureum*, 264; *C. egregium*, 122; *C. Elliottiana*, 501, 532; *C. insignis* var. *Horsmanianum*, 693; *C. i. Sandera*, 692; *C. nitidissimum* x, 6; *C. cananthum Josephine Jolibois*, 501; *C. Pageanum* x, 264; *C. polystigmatum* x, 407; *C. Savageanum*, 407; *C. Tautzianum* var. *lepidum* x, 756; *C. varipictum* x, 407; *Decaschistia ficifolia*, 565; *Dendrobium Wattii*, 724; *Dendrophylax Favocetti*, 533; *Dipodium paludosum*, 91; *D. lacerata* var. *multifida*, 664; *Epidendrum auriculigerum*, 34; *Eucharis grandiflora Moorei*, 628; *Grammatophyllum paludosum*, 91; *Helichrysum devium*, 62; *Lælia anceps Amesiana*, 660; *L. Eotepes* x, 533; *L. Eyeramiana*, 91; *L. pachystele*, 596; *L. Ferrarii* var. *alba*, 565; *L. xanthina agriaphis*, 264; *Lilium Henryi*, 660; *Masdevallia nidifica*, 628; *M. platytrichis*, 178; *M. punctata*, 323; *Megacalinium oxyodon*, 91; *M. scaberulum*, 6; *Narcissus scaberulus*, 296; *Nepenthes Dickinsoniana* x, 543; *N. rufescens* x, 669; *Odontoglossum Andersonianum lobatum* var. *Lemoinei* *anum*, 378; *O. cuspidatum platy-*

*glossum*, 91; *O. Hrubyanum*, 234; *O. maculatum Duvivierianum*, 234; *Oncidium crispum subulve ochraceum*, 756; *O. Jonesianum flavens*, 234; *O. maculatum psittacinum*, 378; *O. pumilum*, 178; *O. robustissimum*, 352; *Passiflora Miersii*, 352; *Pentstemon rotundifolius*, 264; *Phalenopsis Buyssonianum*, 295; *P. sumatrana* var. *Kimballiana*, 6; *Pleurothallis punctulata*, 756; *Polycycnis* the genus, 501; *Rosa gigantea*, 122; *Saccolabium cerinum*, 266; *Sobralia macrantha Kienastiana*, 296; *Thunia candidissima*, 34; *T. Marshalliana purpurata*, 62; *T. M. triloba*, 62; *Trichosma suavis*, 692; *Vriesia Wittmackiana* x, 565; *Waileia paludosa*, 91; *Zygopetalum marginatum*, 693; *Z. Murryanum*, 296

Plants, noxious, 214

Plants, turning, out-of-doors, 106

Platylinis uncta, 695

Pleiones, 570

*Pteroma macrantha*, 661; *P. m. var. floribunda*, 352

Plum, Apricot, 379; *Columbia*, 379; *Diamond*, 379; *Pond's Seedling*, 379; *Victoria*, 379; red grub of the, 763

*Polycycnis*, the genus, 501

*Polygala Dalmatiana*, 475

Pomology in Belgium, 735

Poppies, late Iceland, 484

Potato, chemistry of. (See Chemistry of Vegetation.)

Potato crop, the, 158, 245; in Ireland, 162; reports on the, 152, 189, 217; *Daniel's*, 245; disease, 73, 135, 190, 274, 303, 332, 570; a new, 480; a palliative for, 572; solution to cure, 244

Potato haulm, misuse of, 246

Potato Lavington Conqueror, 418

Potato, relation between the blooming and tuberizing of, 416, 600, 677; removal of haulm, 483, 515; sprouting in the dark, 273; "Worthington Smith," 483; reversion of, 609

Potatos at Chiswick, and the Jensenian system, 630; coloured, 106; disease resisting, 302, 483, 545; hybrid, 161; removing the haulm of, 483

*Potentilla lutea*, 209

*Primroses*, American, 38

*Primula*, the genus, 215, 409, 415; *P. auriculata*, 66; *Chelsea Blue*, 762; *P. nivea*, 641; *P. Rusbyi*, 13, 388, 707

*Primulas*, double, from seed, 17

*Protea cynaroides* and *P. nana*, 693

Pruning, 438, 515

*Pseudophoxis Sargentii*, 408

*Pterocarya fraxinifolia*, 380, 481

*Puccinia lilacearum*, 104

*Pulque*, 671

*Puya lanuginosa*, 411

*Pyrethrum*, 180

*Pyrus aria*, 297

## SALES BY AUCTION.

The Downside Collection of Orchids.  
FIRST SALE, TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY NEXT.

HIGHLY IMPORTANT EIGHT DAYS' SALE of the whole of this renowned Collection, including many plants matches in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of ESTABLISHED ORCHIDS

that has ever been submitted to Public Competition. MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Wm. Lee, Esq. (who is selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL BY AUCTION, on the Premises, Messrs. Protheroe and Morris, at the new office of the Leatherhead Railway Stations, the whole of this extremely valuable Collection of

## ESTABLISHED ORCHIDS.

The FIRST SALE will take place On TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY NEXT, July 10, 11, 12, and 13, 1888, at half-past 12 o'clock precisely each day, in consequence of the large number of Lots.

A list of the principal plants included in this First Sale appeared in the *Gardeners' Chronicle* of Saturday last. A Descriptive Advertisement of the entire Sale will be found on the next page.

Catalogues for both Sales are now ready, and may be obtained of Mr. WORLDFORD, the Head Gardener, on the Premises; and of the Auctioneers, Estate Agents and Valuers, 67 and 68, Cheapside, London, E.C., on FRIDAY, August 10, 1888. N.B.—The SECOND PORTION will be SOLD on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 24, 25, 26, and 27, 1888.

Monday, July 9.

## Masonic Hall, Lincoln.

IMPORTANT SALE of the well-known COLLECTION of PLANTS formed by Mr. Hayland Greenham, of Metheringham Rectory.

MESSRS. RICHARD HALL AND GEORGE VICKERS will SELL BY AUCTION, at the Masonic Hall aforesaid, on FRIDAY, July 13, 1888, the whole of the valuable COLLECTION of GREENHOUSE and other PLANTS, consisting of several grand specimens of *Eucharis* *amazonica*, in perfect health; a magnificent *Cycas revoluta*, fine specimens of *Adiantum farleyense*, *Yuccas*, *Dracenas*, two plants of the lovely *Hoya bella*, and various well-grown *Palms*, *Ferns*, *Epiphyllums*, and other Stove and Greenhouse Plants. The whole are in perfect health and splendid condition, and are admirably adapted for exhibition. The Gardener will show the Plants at Metheringham aforesaid till July 10; they will be removed to and be on view at the Masonic Hall on the morning of Sale from 10 to 12. Sale to commence at 2 o'clock. Auction and Valuation Offices, Bank Street, Lincoln.

## Scotland Nurseries, Tansley, Matlock.

MR. GEORGE MARSDEN will SELL BY AUCTION, at the "Old English" Hotel, Matlock Bridge, on MONDAY, July 16, 1888, at 5 o'clock in the afternoon, the old-established and widely-known NURSERY, as founded by the late Mr. Joseph Smith, with the residence called Scotland House, and Workman's Cottage, Stables and Appurtenances, situate at Tansley, being a total area of 96 acres. For further particulars, apply to the Auctioneer, Wirksworth; or at the Office of JOSEPH STONE, Solicitor, Wirksworth; or Winter.—June 20, 1888.

WANTED, TO RENT AT ONCE, on Lease, about an ACRE of LAND, with Glass suitable for Market Growing. No stock required as advertiser has his own. Address, A. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, a MARKET NURSERY, 2½ Acres, as a going concern. Glass, &c., in good condition. Rent low. All at Roses a specialty. Ten Miles from Covent Garden. Splendid opportunity. S. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## To the Seed Trade.

TO BE DISPOSED OF, a Retail BUSINESS, of many years' standing, situated in a main thoroughfare of the City of London. A good opportunity for a young man of ability and experience. Apply by letter only. X. Z. Z., Messrs. Moon & Gilks, 15, Lincoln's Inn Fields, W.C.

## Florists, Nurserymen, and Others.

Suit Growers, or admirable place to start a good local Business. TO BE SOLD, most compact PREMISES, on the Main Road, rising Suburb, about 5 miles from Marble Arch, containing eight-roomed Residence, large Greenhouse, Forcing Pit, the whole standing in about half an acre of Ground. Lease 97 years at a Ground Rent. Price £2000, which includes Stock and Furniture. HERBERT DRAKE, 343, Harrow Road, Paddington, N.W.

## Beautiful Gardens and Grounds.

A very fine Fernery fitted with Rocks and Choice Tree and

FOR SALE, Freehold, CLIVE HOUSE, Esher, facing Claremont, for many years the residence of the Honble. Mr. Justice Viles; 5½ or 10½ acres. Worthy the attention of any horticulturist who may wish to secure possession of a property with very complete adjuncts of the above description.

Messrs. LOFTS and WARNER, 130, Mount Street, Grosvenor Square, or Messrs. DEBENHAM, TEWSON, FARMER and BRIDGEWATER, 80, Cheapside, E.C. (42/473.)

## Nurserymen, Florists, and Gardeners.

FOR SALE (through dissolution of partnership), the BLACKHEATH NURSERIES, a going concern, in the centre of a wealthy residential neighbourhood, 7 miles from Covent Garden. The long Lease of a compact well-established Nursery of 31 acres, with Stand in Covent Garden Floral Market, 6 Greenhouses, 125 by 13 feet; and 1 House, 105 by 30 feet; all exceptionally well built and heated. A good jobbing business could also be done. Apply, K. J. BUTER, 6, Eastcombe Terrace, Blackheath.

## To Florists and Small Capitalists

Seeking a pleasant and remunerative occupation. THE LEASE and GOODWILL of a well-established BUSINESS, successfully carried on for over 50 years, the present owner retiring. Every investigation courted in personal application. Price £300. Stock at hand. Apply, W. A. CLARK, Nurseryman and Florist, 18, Finchley Road, St. John's Wood, N.W.

TO LET AT ONCE, an Old-established SEEDSMAN and FLORIST'S BUSINESS. Several Greenhouses, all very compact. To a good grower of Plants, Cucumbers, and Tomatoes, with about £250 to invest, an unusual opportunity is offered.—J. F. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE LET, a TOWN MANSION, with large and singularly picturesque Gardens of 1½ acre, belted in with fine old Trees and ample shade and retirement. Large entrance, first-class Stabling, Glasshouses, full sized Billiard-room, full sized and secluded Tennis Lawn, and all accessories. House has been for many years in same occupation, and is in excellent repair. It is but seldom that a property of the kind can be secured, affording, as it does, adjuncts that are only obtainable in the country, although in this case within but little more than a mile from the Strand. Messrs. LUMLEY, 22, St. James Street, S.W.; or Messrs. DEBENHAM, TEWSON, FARMER and BRIDGEWATER, 80, Cheapside, E.C. (42/497.)

Durant's Arbour Estate, Ponder's End, Middlesex. TO NURSERYMEN, FLORISTS, and OTHERS.

TO BE LET, on Lease, for 21, 60, or 80 years, 1 to 50 acres of excellent MEADOW LAND, from 48 to 211 per acre, with the option of the purchase of the freehold within the first 9 years. No title or land tax. Apply to A. AND G. GUIVER, Land Agents, &c., Ponder's End, N.B. Several Nurseries established on the estate.

## Fifty Nurseries, Market Gardens, Florist and Seed

BUSINESSES to be DISPOSED OF. MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

All who are interested in Forests and Gardens should read the American Journal,

GARDEN AND FOREST,  
AN ILLUSTRATED WEEKLY JOURNAL OF HORTICULTURE,  
LANDSCAPE ART AND FORESTRY.

Conducted by Professor C. S. SARGENT, of Harvard College, Mass.

Subscription 21s. per annum, including postage.

"It is as handsome a journal of its class as any one can wish to see. With its orderly arrangement, exquisitely neat appear-  
ance, and the air of freshness pervading its pages it reminds us of nothing so much as a well-kept June garden. Its appearance  
will be welcomed by a large class of men and women who love flowers, plants and trees, and want to know more about what they  
see or fail to see in their suburban gardens and in their rural walks. Upon all these fields *Garden and Forest* enters with a  
freshness of observation and an air of intellectual vigour which give promise of a career both useful and successful."—*New York Tribune*.

SATURDAY, JULY 7, 1888.

**NOTES FROM FULHAM PALACE.**

FEW places near London possess greater historic interest than Fulham Palace, or are more noted for remarkable or rare trees. The Manor House of Fulham, or, as it is now called, Fulham Palace, has been the summer residence of the Bishop of London for more than eight centuries. The principal entrance to the Palace is through a fine avenue of aged Limes; and the gardens, which are very old, have been famous since the time of Bishop Grindall, who lived in the time of Queen Elizabeth. It appears that Grindall got himself into trouble by sending some fine Grapes to the Queen, with whom they disagreed, and the Bishop was accused of having the plague in his house—an accusation which he was able to disprove.

According to Fuller's *Worthies* it was Grindall who first imported the Tamarisk into this country. This tree, writes Fuller, "hath not more affinity in sound with Tamarind than sympathy in extraction, both originally Arabick—general similitude in leaves and operation; only Tamarind in England is an annual, dying at the approach of winter, whilst Tamarisk lasteth many years. It was first brought over by Bishop Grindall out of Switzerland (where he was exiled under Queen Mary), and planted in his garden at Fulham, in this country, where the soil, being moist and ferny, well complied with the nature of this plant, which since is removed, and thriveth well in many other places."

Bishop Compton has the well earned credit of being the great gardener at Fulham Palace. He was banished to Fulham by James II., and remained in the place for two years, attending diligently to his garden during that time. He planted there many exotics and trees, then almost unknown in England—a great Cork tree, a characteristic specimen, but now much decayed. In passing I may observe that this is the stage which many once fine examples have now reached. This tree, which was at one time the

largest in England, and also a large *Ilex*, are traditionally said to have been planted by his hand. Bishop Blomfield planted a Cedar of Lebanon, which is now a fine tree, although much damaged by the great snowstorms of the winter of 1886-87.

One fact notably strikes the visitor: the thickness with which the trees are planted here. One Bishop having thinned them considerably, Lord Bacon wittily told him that, "Having cut down such a cloud of trees, he must be a good man to throw light on dark places!"

It may prove somewhat of interest, perhaps, to put on record here that Sir William Watson, who made a botanical survey of the ground about a hundred years ago, speaks of this garden in the following terms, in a report to the Royal Society:—"The famous botanical garden at Fulham, wherein Dr. Henry Compton, heretofore Bishop of London, planted a greater variety of curious exotic plants than had at any time been collected in any garden in England."

It is not at all surprising to find that Evelyn, with his intense love of gardening, was a visitor here. In his *Diary*, under date of October 11, 1681, he writes, "I went to Fulham, to visit the Bishop of London, in whose garden I saw the *Sedum arborescens* in flower, which was exceedingly beautiful."

Since the present Bishop, Dr. Temple, came into residence, great alterations and improvements in the grounds have been made by him, under the direction of his gardener and bailiff, Mr. A. J. Ballhatchett. To refer to only one portion of the grounds: On the north side of the Palace a great and much needed "clearance" has been made. A plantation of old *Acacias* has been dug up, and the ground sown with grass, which now forms part of the fine lawn, thus throwing into bolder relief this side of the Palace. A moat, exactly one mile in length, surrounds the grounds. This is filled from the River Thames whenever the tides permit, through a very old-fashioned sluice and gates. Last winter the moat was cleaned out—a gigantic task—and some 5000 loads of mud removed therefrom. This was spread, in order to get rid of it, in the best way, on the park field; its good effect will, doubtless, be seen there in due time.

A few brief notes on some of the most notable trees observed on a recent visit may fitly be added to this necessarily hurried description of a place so rich in arboricultural interest. A very fine *Gleditsia*—a representative of a race of ornamental hardy deciduous trees—was noted. Before a large limb came off some years ago it was considered to be the finest of its kind in the kingdom. *Platanus acerifolia* is represented by a magnificent, symmetrical specimen, some 80 feet in height; the girth of its trunk at base measuring 18 feet, and the spread of its branches forming a perfect circle, being 66 feet. English Elms abound, and are represented by some stately examples, one we measured being 23 feet 6 inches in girth at the base of the trunk, and from 60 to 70 feet in height. A Black Walnut (*Juglans nigra*), a noble specimen, but damaged by storms, some 24 feet in girth at the base of the trunk; and an idea of the timber contained in it may be estimated from the fact that £30 has been offered for it, and refused. *Ailanthus glandulosa* is a fine example, though somewhat damaged by the storms of last winter. Flowering Ashes were noted as being very conspicuous. The old Oaks are, as might be imagined in such a place, worthily represented. The columnar Oak, *Quercus fastigiata*, is well worthy of particular mention; but the Oaks, as a rule, have suffered by the storms. The Horse Chestnuts, of which there are many, are venerable trees. *Thuja gigantea* was noted as doing well here, and was represented by fine symmetrical examples. *Araucaria imbricata* and *Wellingtonia* do not grow well, the light sandy soil not suiting their requirements; and smoke and fogs have something to do with their unhealthiness.

The Mock Oranges, those useful and effective

flowering subjects, are much esteemed here, about a hundred fine bushes being distributed over the place. Very striking is the row of *Poplars* (common variety) planted by the moat, towering above every other form of tree growth—from 70 to 80 feet in height—trunks unusually large for this kind of tree. Unfortunately many of them are now decaying; a number of them are about of one age, and seem to have been planted by one particular Bishop. However, to replace those whose end is approaching, Mr. Ballhatchett has planted several young ones. The storms of recent winters have something to answer for, in that they uprooted a fine but aged example of the Judas Tree, *Cercis siliquastrum*.

A few words, by way of conclusion, on the indoor departments. As may be imagined in such a place, a great many subjects are grown for house decoration. These are done well, both foliage and flowering, consisting of the usual type of plants used for such work, fifteen houses being devoted to their culture. There are some old vineries; the early one—at the time of our visit—was in "cutting," and consisted chiefly of Black Hamburgh, in capital condition.

A second early viney was showing a splendid crop of fruit, all thinned and swelling well; and a later house looking well for an excellent crop. *B.* [Several illustrations of the historic trees at Fulham Palace were given in our volume for 1879, vol. xi.]

## NEW OR NOTEWORTHY PLANTS.

*CYPRIPEDIUM NITIDISSIMUM* ×, *n. hybr.*, *Angl.*  
(*SELENIPEDIUM NITIDISSIMUM*.)

ARE you a determined foe to hybrids? Then try to see the grand novelty just raised by Mr. Norman C. Cookson, Oakwood, Wylam-on-Tyne. It is a *Cypripedium*, whose parents are *Cypripedium Warszewiczii* (*Selenipedium Warszewiczii caudatum roseum*, not *Cypripedium caudatum*, Lindl., in *Paxton's Flower Garden*, which is the genuine caudatum, a variety of which is my *Wallisii* as it appears), and *C. conchiferum*.

It has been compared with *Cypripedium grande*—the dimensions, indeed, are the same, but the leaf is much narrower, and the flower is, *me judice*, quite distinct. Sepals broader, lightest whitish-ochre with numerous yellowish ultimately brown (always?) nerves. Tails apparently longer, yellowish in the centre downwards, still they get narrower when they become brown. There are two marginal brown lines at the superior part, and very short fine hairs on the upper border. The lip is longish, and the lateral extensions over the sac are remarkably smaller than in *Cypripedium grande*. The growth itself is as if varnished, brown with a central green stripe in the middle, pallid underneath and with translucent spots towards the base. The involved lobes of the lip are sulphur coloured with fine cinnamon spots. This is very effective. The two extensions are blunt, low, brown, small, staminate triangular, brown, with indian-purple hairs behind. Apiculus of staminate very strong, bent underneath. The stalked ovaries are very much longer than the spatheaceous acute bracts. The inflorescence at hand has two immense flowers and a bud. What may not an older plant show!

The leaf is 1½ foot long by 1½ inch wide, strongly keeled underneath on the mid-line. It is a great novelty. *H. G. Rehb. f.*

*CATTLEYA LABIATA* MOSSIE (*Lindl.*), var. *PETERSII* (*André*)—*CATTLEYA PETERSII*, *André*, *Rev. Hort.*, 1885, 271.

This is a grand thing! It is quite distinct from any of those striped Mossies which have appeared lately several times. The flower is of a very warm dark lilac-purple colour. The anterior disc of the lip has numerous confluent much darker lines. Light purple oblique lines run over the side lacinia. There is a small space of lightish yellow on each side between the lines of the anterior disc. It flowered first in 1883. It was

exhibited in 1885 at Paris, when M. André described the plant. It arrived with C. Mossie. The leaves are quite distinct, very showy, hard, light green, with very dark green spots. The pseudobulbs even are now reddish. It was kindly sent me, as the name implies, by Mr. A. A. Peeters, 58, Chaussee de Forest, 58, St. Gilles, Bruxelles. *H. G. Rehb. f.*

*PHALENOPSIS SUMATRANA* var. *KIMBALLIANA*, *n. nov.*

This is an unusually fine variety of *Phalaenopsis sumatrana*. Sepals and petals rather broad, bright yellow, with red transverse bands. Lip light ochre-coloured; callus of the side lacinia (one on each side) orange, keel at the base of the mid lacinia well developed. Hairs on the anterior part of the lip uncommonly few. *P. fasciata* is similar, but very distinct in the details of the lip. A fresh importation of Mr. F. Sander, at whose wish it is dedicated—and with great pleasure on my part—to the really excellent American orchidist, Mr. W. J. Kimball, Rochester, New York. *H. G. Rehb. f.*

*MEGACALINIUM SCABERULUM*, *Rolfé*, *n. sp.*

*Megacalinium* is a curious little genus, in which the rhachis is enlarged and much flattened laterally, the flowers being seated in a row on either side, the whole having a very singular appearance. The flowers are much like those of *Bulbophyllum*, in which it is sometimes merged, the lip oscillating up and down on a slender elastic base. Eleven species have been described, all but one from tropical Africa, the majority western, the single extra-tropical one being M. *Sandersoni*, Hook. f., from Natal. A second extra-tropical species has now appeared, having been imported from Pondoland, and grown by Mr. Tillett from whom the specimen was received.

It is a small plant with creeping rhizomes, tetragonal ovoid pseudobulbs, each with a pair of elliptical-oblong leaves, 2 inches or more long, and an erect inflorescence about twice this height. The peduncle bears about four sheathing bracts, the upper half being flattened, ¼ inch broad, dull whitish-green densely spotted and marbled with dusky purple, and with seven or eight flowers on either side, of a dull purple colour, the base of the sepals being whitish-green with purple spots. The sepals outside are minutely papillose, giving a roughish surface—hence the name. The dorsal sepal is narrowly lanceolate, linear, acute, fleshy, 4–4½ lin. long, the lateral sepals shorter, falcate, with broadly ovate base, and narrowly acuminate acute apex. The petals are falcate, reflexed, very narrowly linear acute, 2 lin. long. The shorter lip is sharply reflexed, the basal half broadly suborbicular, then rapidly narrowed into a broadly linear, obtuse apex. This upper half is strongly grooved inside, while a double keel outside extends to near the base. The very short column has a pair of broad fleshy wings which terminate as a pair of short obtuse teeth, besides which is another pair of triangular acute teeth at the apex of the column. Africa is not yet exhausted of its novelties. *R. A. Rolfé*.

*CYPRIPEDIUM* × *ATYS*, *n. hybr.*

Among the collection of hybrids of the late Dr. Harris, of Lamberhurst, Kent, a somewhat curious *Cypripedium* has recently flowered, which may be distinguished as above. The collection named has been acquired by Messrs. James Veitch & Sons, of Chelsea, but unfortunately the records of parentage, have either been lost or not kept with the plants. The flower presents but slight differences from *C. venustum*, and even these are very difficult to define—perhaps a little more colour towards the apex of the petals, and a few other slight modifications. But the leaves are altogether different from those of typical *venustum*, and very closely resemble *C. Hookeri* or *C. Bullenianum*. It has therefore been considered as a probable hybrid between *C. venustum* and *C. Hookeri*, which seems not unlikely. Its hybrid character is scarcely open to question, and the characters it presents agree more with those two species than with any other, as far as I am able to see. It is unfortunate that the parentage of so many

hybrids should be lost in this manner, although in many cases it is possible to give approximately correct guesses as to parentage. *R. A. Rolfe.*

## THE BULB GARDENS OF HAARLEM.

(Continued from p. 686, vol. iii., 3rd ser.)

**HARDY FLOWERS FROM C. G. VAN TUBEROEN, JUN., SWANENBURG.**—I sent a few notes some time ago about the hardy plants in Messrs. Tubergen's nursery. Since that time they have sent me various gatherings of hardy flowers. They write, June 24:—"Hyacinths and Tulips are lifted, and the bulb gardens are very bare of flower, but the hardy plant garden is quite an oasis among the bulb gardens." I wondered at the time how it was that so many different classes of flowers could be successfully cultivated in their loose sandy soil; but I am now informed that specially prepared beds of suitable soil are made up for the various classes of plants, and the examples of hardy flowers sent show how well they are grown. Something like a hundred varieties of *Iris hispanica* (the small bulbous Spanish *Iris*), and also the large bulbous *Iris*, usually termed the English *Iris*, were sent. Most of the English *Iris* blooms came in the bud state, and they expand their exquisitely tinted petals in water as freely as they do on the plants, the colours being more delicate; they were very varied in colour—white, blush, lavender, rose, blue, purple, deepest violet-purple, and even crimson, streaked and blotched in endless variety. No *Orchids* are more delicately beautiful. Such flowers, that can be purchased at two or three shillings per dozen, should be planted in every garden. Nearly a hundred spikes of *Ixia*, the flowers of very large size, and the colours of the most varied kind, with the leaves of a deep green colour to the tips, testify how well they grow in the prepared soil.

Of *Lilium Thunbergianum* four very distinct varieties were sent; the prettiest one is Prince of Orange, apricot colour; an unnamed semi-double form was also very striking. *L. pomponium*, like a large form of *tenuifolium*, very elegant. *L. monadelphum Szovitzianum* (Colchicum)—this is one of the most handsome of garden *Lilies*, and produced as many as eight flowers on a spike. *L. columbianum* (the Oregon *Lily*) is a very pretty little species with rich orange flowers freely spotted. The ordinary *L. Martagon*, with a very long spike, and the pure white form, was also vigorous and very charming. Amongst the smallest flowered *Lilies* were the orange-scarlet *L. carnioicum*, *L. tenuifolium*, and *L. pulchellum*, quite scarlet; they are very charming at this season.

*Brodiaea coccinea*, of a rich magenta-crimson, with the segments of the mouth pale green, are in marked contrast to *B. congesta*, two flower-heads of which are also sent, the flowers of a pretty clear lilac colour.

Hardy *Orchids* are represented by varieties of *Orchis maculata*, slender spikes of delicate pale pink flowers of *Gymnadenia odoratissima*, and the curious *Listera ovata*, besides a noble growth of the best of all hardy *Orchids*, *Cypripedium spectabile*, with its lovely white and rose flowers. *Allium azureum*, a very pretty Siberian species, with quite-globular heads of decided blue flowers. *Triteleia laxa maxima* is quite a large form of this species, and a good large head of it was sent. *Crinum longifolium* album has pure white flowers with a greenish centre—a striking plant. A long spike of the clear yellow *Eremurus Bungei* was also sent; it is a Persian species, and one of the finest hardy garden plants introduced in recent years. This genus of *Liliaceae* plants contains some of the most noble examples of hardy flowering plants we have at present in cultivation. *Eremurus spectabilis* has been in cultivation for many years—in fact, since 1800. It is figured in the *Botanical Magazine*, t. 4870, where it is stated to be a native of Altaic Siberia, the Caucasus, Kooristan, Tauria, Scinde, &c. *E. robustus* is a more

recent introduction, and is one of the most noble of the species, throwing up spikes of peach-coloured flowers 9 to 10 feet in height. It was first flowered in Europe in 1871, in the Moscow Botanic Garden. It is also well figured in the *Botanical Magazine*, t. 6726, and in *Gartenflora*, 769. A spike of its flowers has been grown 4 feet in length. They must all become popular garden plants when more plentiful. *J. Douglas.*

## ROSES.

THE buds to be used for budding are in the best condition just about the time that the flower-shoot from which the buds are taken is bearing a fully open flower. It is best to use buds from shoots which have produced flowers. The bark of the stock must part freely from the wood, so that the bud may be placed in position without undue pressure. Insert the buds on standards as near the base of the shoots as is practicable, leaving on the leaf-stalk, and removing before insertion any woody tissue there may be, but in so doing be careful not to injure the base of the bud. Bind round with worsted or matting, but this I do not recommend as the best. I prefer not to head back the newly-budded shoots on standards, but tie the points down to the old wood. Two or three weeks after budding they should be examined closely, and ties loosened where necessary. Summer pruning of the Banksian Rose may now be done. Cut off all shoots that have flowered, as well as weak and spindly sprays. All the strongest shoots should be retained, nailed in or tied to wire and allowed to grow till the end of the season. Treated thus, and growing on a wall with a south aspect, the Banksian will flower freely every year, and yet to see it in this condition is the exception. *Rosa rugosa* is now flowering with me. It is a charming subject for growing in the front of shrubbery borders; the flowers, which are single and of a deep rosy-pink colour, together with its handsome foliage, render it a very striking object when growing amongst other dwarf shrubs. In the autumn months, when in fruit, it is also a conspicuous object. As soon as Austrian Brier and Persian Yellow have done flowering, the old flower-shoots and other superfluous wood should be cut off, laying in only the strongest shoots, which require to be well ripened to flower well the succeeding year. Look over the beds of dwarf Roses, cutting out all Manetti suckers whenever they appear. Remove all seed-pods as soon as the petals fall.

If it be desired to work up a stock of plants on their own roots, cuttings may be put in towards the end of the month; these should be taken off with a heel, and inserted in a good sandy compost in 5-inch pots, well drained, placing them round the sides of the pots, about a dozen in each; well water them overhead, and stand them in a shady place for a few days, then put them into a Cucurbit or Melon frame, where successional crops are being grown, and where the cuttings will have the benefit of a little bottom-heat, and if not too hot the pots may be plunged to the rims and kept shaded from bright sunshine till they are rooted, at which period shift them singly into 3-inch pots, keeping them in the same place for a time, and later on harden off in cold frames. *J. Horsfield, Heytesbury, Wilts.*

GLOIRE DE MARGOTTIN.

The *Revue Horticole* publishes in the number for June 1 a coloured plate of a new Rose called Gloire de Margottin. This Rose is said to have had one mother, viz., Gloire des Rosemones, but several fathers, among whom Goubault (Tea) was predominant. We suppose this means simply that the male parent is not exactly known, unless the Rose be like "Cerberus, three gentlemen in one," each with its own father. The buds, according to the figure, are elegant, the flowers large, very double, brilliant crimson-red, which does not turn violet as the flower fades. Our contemporary speaks highly of it as a cut flower for market purposes. It does not look like an exhibition Rose.

## MUSHROOMS.

DURING the month of June just ended the soil of many of our meadows and pastures has been in that condition of warmth and moisture most favourable to the growth of outdoor Mushrooms, consequently a larger quantity has been gathered than has been known at this time of year for many seasons past. We were told last week by a gentleman that from his park had been gathered, for several days in succession, 26 bushels of Mushrooms per day, and that these had realised in the London market 12s. per bushel.

We were further informed—and this has also been found the case—on the estate of Sir J. B. Lawes, at Rothamsted, that Mushrooms grow most plentifully in pastures where the cattle had received a liberal supply of cotton-cake as food. This description of food is known to result in an extremely rich manure, as is shown by the following figures, taken from a table compiled by Sir J. B. Lawes and Dr. Gilbert, showing the manure value of 1 ton of deoecorated cotton-cake after consumption as cattle-food:—

Total remaining for Manure:—				
Nitrogen	...	...	...	143.5 lb.
Phosphoric acid	...	...	...	24.5 "
Potash	...	...	...	10.9 "

Formerly a good deal of mystery was supposed to attach to the growth of Mushrooms. Thus Shelley says—

"Agarics, fungi, mildew, and mould,  
All start like mist from the wet ground cold."

But it is now well known that even the lowest order of plants do not start into life without some predisposing cause, or without something or other has caused decay when they arise. And by the study of the phenomena connected with the growth of these plants modern investigations have made them perfectly amenable to certain rules of artificial culture.

Scientific research has further demonstrated the fact that Mushrooms are extremely nitrogenous bodies, and that they absorb immense quantities of both nitrogen and carbon in their growth, the source of which, until recent years, was supposed to be the atmosphere, but which is now proved to be the organic nitrogen of the soil itself; consequently the removal of the Mushrooms from a pasture is accompanied by a considerable reduction in the amount of the organic nitrogen and carbon in the soil. Further, it has been proved in the Rothamsted investigations that the action of the mycelium of the fungi is not only to reduce the carbon in a greater proportion than the nitrogen of the soil, but to do so in a much greater degree in proportion to the amount assimilated, a portion of the carbon being doubtless exhaled as carbonic acid. *John J. Willis, Harpenden, July.*

## VEGETABLE PRODUCTS IN CENTRAL AFRICA.

THE following notes on vegetable products in Central Africa are gathered from a recent report furnished to the Foreign Office. Rubber, it is stated, is now found in very small quantities, and indeed, can scarcely be considered worthy of mention. This is undoubtedly owing to the destructive method adopted by the natives of extracting the juice. Under proper treatment rubber might have become a profitable export. At Mount Zomba *Landolphia florida* was found in large quantities, but the plant is now almost exterminated. Rubber from this species sold in Africa last year for 1s. 6d. per pound. The cultivation of rubber-yielding plants by Europeans appears to be attracting attention, and it is stated that a plant of *Ficus elastica* that had been introduced into a private garden had grown so well that it was intended to propagate it extensively. Indigo grows wild all along the slopes of Mount Zomba. It forms a large bush, and is perennial. Its growth is luxuriant, and its cultivation and manufacture might possibly be undertaken with advantage.

Of the Kombe (*Strophanthus*), which has attracted so much attention in this country of late, it is stated that during last year over 1100 lb. were exported from the districts around Zomba, which realised in the London market 9s. per pound. The following description of the plant and its uses is given:—"Strophanthus is considered the most powerful poison the natives possess. It is found at a low level, and as far as can be gathered from personal observation and native sources, is not to be had on the high land. The supplies hitherto obtained have been drawn from the right bank of the River Shire below the Murchison Rapids. There is apparently more than one species, or, at least variety, the distinguishing feature being a much smaller pod and fewer seeds. At present information relative to these other varieties is scant. The *Strophanthus* is a strong climbing plant, and is always found in the vicinity of high trees on which it supports itself. The stem varies in diameter, but has an average of a few inches. It lies on the ground in folds, the branches supporting themselves on the nearest trees. The young branches have a rod-habit, and are in appearance not unlike Elder. The fruit grows in pairs, and has a peculiar appearance, very like a pair of immense horns hanging to a slender twig. The fruit begins to ripen in July and lasts till the end of September. The natives are quite ignorant of its age or how old a plant may be before it bears fruit. The native method of preparing the poison is very simple. They first deprive the seeds of their hairy appendages, and then pound them in a mortar until they have reduced them to pulp; a little water is then added. This is done by using the bark of a tree containing a gummy substance, which helps to keep the poison on the arrow in the event of its striking against a bone. The poison thus prepared is spread upon the arrow, and allowed to dry. Game wounded by arrows poisoned with *Strophanthus* dies quickly; the flesh is eaten without evil effect. The only precaution taken is to squeeze the juice of the Baobab bark in the wound made by the arrow, and this counteracts the evil effect of the poison. Buffalo and all smaller game are killed by this poison."

Though fibres are much in use amongst the natives, it is said to be doubtful whether those of native preparation would command a profitable sale in the home market. In the highlands of Zomba *Sansevieria longiflora* grows abundantly, and Likanga fibre is obtained from it. At lower elevations, such as Lake Shirwa; and Livingstonia, another species, is found. The fibre which is obtained from the leaf might be used for coarse manufactures, but proper machinery would be required to perfectly crush the leaves and obtain the fibre. The Buzze fibre (*Securidaca longipedunculata*) is used by the natives for stringing beads and for making twine; and a fibre known as Ntingo, said to be from a Tiliaceous plant, is much used by the fishermen on Lake Nyassa for making nets.

On the subject of Coffee culture it is stated that, promising as it seemed to be two years ago, the result hitherto obtained has not realised the expectations of the planters, and though the quality of the Coffee grown at Zomba has been established beyond doubt, still more experience is required before it can with certainty be said whether the cultivation of Coffee in those districts of Africa will be successful or not. The crops grown last year, both in the Mandala and Zomba districts, were to a great extent rendered unsaleable by the berry becoming diseased just before attaining maturity. The same disease is said to be showing itself again this year, the cause of which is partly attributed to allowing the trees to bear too profusely. In Coffee culture the difficulty of obtaining labour presents a serious obstacle. At the season when the planter requires a large supply of labour to keep down weeds and plant out new ground, the natives are all employed making their own gardens, and will not do other work.

Proprietors of small plantations may, with their few permanent hands, tide over the difficulty till workers can be obtained, but the question of labour

forms a serious consideration, and will tell greatly against any foreign enterprise on a large scale being successfully carried out in this country. Another drawback to the prospects of Coffee planters is the heavy transit freights to the coast. Until competition brings about a lower rate of charges, a serious barrier is opposed to the development of European enterprise in these territories.

In favour of the cultivation of Coffee it may be stated, that land with suitable soil can be purchased cheaply. Though unlimited acreage of good soil may not be obtainable, still sufficiently large areas to justify planters in establishing plantations can readily be got. At present about 90 acres of land in the Zomba and Blantyre districts are under Coffee cultivation, a considerable portion being new plantation formed this year. Sugar-cane grows well in the Zomba district, and is rich in saccharine matter. It is successfully cultivated and manufactured by Messrs. Buchanan Brothers, who have erected a sugar-mill on their estate. At present it would not pay to export sugar from Zomba, and as yet it has only found a local market with the Europeans in these districts. The natives, though very fond of sugar, have not shown any desire to purchase the manufactured article.

A few Tea plants have been introduced, and grow fairly well; but as yet nothing definite can be said of the prospects of Tea plantations. In the highlands it is doubtful whether the cultivation would ever prove successful, and the uncertainty of labour would render it a very precarious undertaking.

*Cinchona* has been introduced and shows every prospect of its cultivation being a success, from the fact that plants three years' old are now 6 feet high. It remains to be seen whether the quality of the bark will justify the planters' investment of capital, and whether the state of the market will offer encouragement. A small plantation of 1000 plants has been formed this season at Zomba.

## TREES AND SHRUBS.

### CLEMATIS BALEARICA.

AMONG the excellent illustrations of the *Flora of Spain and the Balearic Islands*, in course of publication by Prof. Willkomm, t. 122, recently published, is devoted to an excellent figure of this very elegant Clematis, which, though long since introduced into our gardens is not seen so often as its beauty warrants. This may arise from its being slightly tender on cold soils and in exposed situations, when it does not flower freely, but the elegantly cut foliage and its deep green colour render it most desirable in suitable situations. Prof. Willkomm retains the name *balearica* but considers it as a form of *C. cirrosa* with more deeply divided leaves. In the same fascicle is figured a variety of *C. cirrosa* with the perianth segment thickly spotted with red. The plant is figured in the *Gardeners' Chronicle* in 1878, vol. ix., p. 501.

### ZENOBIA PULVERULENTA.

Mr. Vertegans sends us blooms of this very beautiful hardy shrub. Though by no means new, it is not nearly so often grown as its merits warrant. The glaucous leaves and racemes of flowers, like those of Lily of the Valley on a large scale, are very ornamental. A figure of the plant will be found in our columns, July 28, 1888.

### EMBOTHRIUM COCCINEUM.

In the grounds of Eastdon House, the residence of H. Waterfield, Esq., near Starcross, on the South Devon coast, with an eastern aspect, is growing one of the finest specimens of *Embothrium coccineum* I have ever seen. It is now about 12 feet high and the same in width, and for some time past has been full of bloom of a most exquisite vermilion colour. It has now stood eleven seasons outdoors perfectly healthy. The bed prepared for its reception, says Mr. Bach, the gardener, was half loam and peat. It seeds freely, but he has not been able to get any to germinate. P. P.

### THE LEAVES OF TREES.

A feature common to the great majority of trees and shrubs, evergreen and deciduous, indigenous and exotic, representing, as they do, many families, is that the leaves borne on their stem and stronger branches are as large—generally larger—and, I believe, not less, but usually more numerous, than those borne on weaker shoots. This seems consistent with their more favoured position on the central and stronger sap channels; more favoured as to light, whereby they are presumably enabled, in accordance with the most modern physiological view, to assimilate while unfolding a greater quantity of nutrient matter, their ultimate size being determined by the amount. Briefly stated, the size of the leaves of such plants is, normally, in proportion to the volume of the shoot. But this rule is not unbroken. Nature would not be true to herself were she not occasionally phenomenal.

I have for many years, at intervals, been puzzling my brains to account physiologically for the comparatively small leaves borne on the stems or leader shoots of Firs (*Abies*), and, but in a less well-marked degree, of Spruces (*Picea*). The feature is, perhaps, best exemplified in the case of adolescent and doubtless also old trees of *Abies Lowiana*. Readers well acquainted with the tree will at once think of, if they cannot see, the long—up to 3 inches or more—rather broad, obtuse or emarginate leaves of the stronger branches. The stem leaves, on the contrary, are short, pointed, with the blade narrow, and in many cases irregular on the edges, or constricted, and all archedly incurved. These are excessively disproportionate to the leaves of all but the uppermost branches. The rule seems to be—the smaller the volume of the shoot, the greater the leaf surface. The smaller branches, wherever situated, are more or less overshadowed, seldom well favoured as to light. The volume of the stem-shoot would seem to be attained at the expense of the leaves. Either this, or the latter are exceedingly sensitive to light. A factor calculated to prejudicially affect the size of leaves is exposure, not so much to light—though this has a retarding effect—as to detrimental weather, as strong or chilly winds and rains; and it cannot be doubted that stem-leaves, in their elevated position, are specially subject to such influences. But the relative smallness of stem-leaves to those of the branches would seem to be generic; at least it may be said to be common—I will not say peculiar—to the genera *Abies* and *Picea*. This, however, in a specifically variable degree, the extreme culminating, as I have already remarked, in *Abies Lowiana*. Geo. Syme, May 11.

## ORCHID NOTES AND GLEANINGS.

### DENDROBIUM WARDIANUM.

An illustration of a fine plant of this useful species is seen at fig. 1, which is a representation of the notable specimen exhibited at the Royal Horticultural Society's meeting on March 13 last at South Kensington. It was grown by Mr. East, gr. to F. Wigan, Esq., Clare Lane, East Sheen, and, when exhibited, was fully 4 feet in height, and, as may be seen, wonderfully full of flowers.

### IONOPSIS PANICULATA.

This desirable species belongs to a small genus of epiphyllal Orchids coming from Tropical America. The pseudobulbs are small; leaves lanceolate, about 4–6 inches long, from the axils of which erect flower-stalks issue bearing flowers. The colour of the flowers varies considerably in different plants, but is usually of a pretty bluish-white; the broad bilobed lip has a purple spot at its base. The flowers remain for a long time without fading, and, according to "Descourtiz" in Williams' *Orchid Manual*, they remain fresh in their native forests from September until the following May. Grown in small pans, suspended from the roof in the warm-house,

they do well. The species is to be seen in flower at the Vineyard Nurseries, Garston, F. Ashton.

#### BULBOPHYLLUM LOBBII.

With the exception of a few species the *Bulbophyllums* afford very few which are worthy the attention of the ordinary cultivator. The species under notice is perhaps the best; the flowers, which are solitary

### HARDY PLANTS.

*CALTHA PALUSTRIS*, FL.-PL.—Most persons are acquainted with the common Marsh Marigold, but not with the double form, which, however, is a plant deserving of a more extended cultivation in our gardens than it has at present. It is eminently adapted for growing at the base of rockeries, margins of

pagated by division, which should be done immediately after the flowering period or early in the autumn before the leaves die down.

#### MERTENSIA SIBIRICA.

This handsome hardy perennial is now flowering in the herbaceous border. As the specific name would lead one to infer, it is quite hardy, and on this account there need be no hesitation about growing it in northern counties or in exposed situations. The flowers are pale pink in a young state, changing to a beautiful porcelain-blue when fully expanded, and are produced on a loose, terminal, pendent cyme, which gives it a somewhat graceful appearance. The leaves are of a bluish-green tint, ovate, acuminate, the upper ones sessile, lower ones stalked; height of inflorescence about 15 inches, but in good soils would probably attain 2 feet, and as such would make a very good second or third-row plant in a mixed border. Although most at home in rather damp loamy soils it will do very well on a fairly well-drained south border, but in this case will have to be watered. The plant is easily increased by division either in spring or autumn.

#### ANEMONE VITIFOLIA

at the present time is flowering profusely on the rockery here. The flowers are cross-shaped, about 1 inch across. Sepals white, forming a pleasing contrast to the pale lemon-coloured stamens, and are borne on stems about 15 inches high. It is scarcely adapted for rockeries on account of its creeping rootstocks, which spreads with much rapidity when in a favourable soil; but for planting along the sides of woodland walks, or in shady nooks and corners amongst hardy Ferns, nothing is more suitable, and in flowering it follows closely upon those earlier *A. apennina* and *A. ranunculoides*. A light well drained soil of poor character, with partial shade overhead, will be found to suit it.

#### A. SYLVESTRIS.

In this we have a species that ought to be grown on all rockeries where choice subjects are in request. The flowers are of a more pure white than the above named, and are more than twice the size, and the plant grows from 9 to 12 inches in height. It will be found useful for cutting purposes, being equal in appearance to *A. japonica alba*. A deep, rich, sandy loam is what it delights in, but will also grow well in a chalky soil, with a little peat added thereto, and may be increased by dividing the rootstock early in the spring.

#### HIERACIUM AURANTIACUM.

In this we have an extremely pretty Composite—one that ought to find a place in all collections of hardy plants, not only on account of its freedom in flowering, but by reason of its being so distinct amongst herbaceous subjects; and in addition to this it will be found not at all fastidious as to soil or situation. The flowers are of a deep orange-scarlet in colour, and are borne on stems from 12 to 18 inches high, in terminal fastigate panicles, with individual flowers about an inch in diameter, and which will be at their best from about the present time for some few weeks to come. Unlike many good things, it is not slow to increase, and may be freely raised from seed, and the old roots divided into single crowns, either in spring or autumn; indeed, after it has once become well established in a garden, the object will rather be to prevent undue increase, not that it will assume the character of a weed by any means.

#### TRADESCANTIA VIRGINICA ROSEA.

Although this has been in commerce some few years, it is, comparatively speaking, seldom met with in old gardens, and seems to be little known outside those places where the most select collections are grown. The flowers are of a beautiful rose colour, and in this respect only does it differ from the well-known *T. virginica*. It is equally free in flowering, and quite as useful in all other points, requiring similar treatment in regard to culture, and is increased by

FIG. 1.—SPECIMEN PLANT OF *DENDROBIUM WARDIANUM*. (SEE P. 8.)

and produced on radical scapes, are large, with sepals and petals of a deep tawny-yellow; the upper lip is spotted at the back with purple. It thrives well in sphagnum in pan or basket suspended from the roof in the warm house, and whilst growing requires a considerable amount of moisture. A plant is now flowering in the Vineyard Nurseries, Garston, F. A.

ROYAL GARDENS, KEW.—A refreshment pavilion is to be forthwith erected in the Royal Gardens, Kew, near the Pagoda.

ornamental water, or in undrained pieces of ground where only semi-aquatic species will grow, and further it will be found useful for cutting. The flowers are of a deep yellow, very double, and are produced on branched stalks from 9 to 12 inches high, with deep green orbicular leaves. As to soil and climate it does not appear to be at all fastidious so long as it can enjoy plenty of moisture at the roots, although the latter does not seem to be indispensable to it at all times, as we have it growing here in the herbaceous borders, but not so luxuriantly. It is pro-

division. A peaty loam suits it best, but it will grow in any fairly good garden soil, attaining a height of 2 feet, and flowers from now till the end of the summer.

#### LYCHNIS DIURNA PLENA.

This is a double form of our common wild flower which has found its way into gardens. It is a double Rose Campion, and its great recommendation centres in its long period of flowering—May to July—and in its prolific flowering propensity and usefulness for cutting purposes. As a second-row plant—growing to a height of 2 feet—it will be found an acquisition. Propagated by division.

#### GERANIUM PLATYPETALUM.

Perhaps this is one of the most showy and attractive Geraniums that one could wish to meet with. In the herbaceous border here it certainly is a picture just now, and will continue to be so for another month or so. The plant grows about 2 feet high; the flowers are borne in profusion, and in general appearance resembles *G. pratense*. The colour is rich violet-blue, the inner surface of the petals being veined with dark purple lines. A well-drained and poor calcareous soil suits it very well, and the roots may be divided early in the spring; and before flowering the plants should be staked and tied, as else the wind will probably break them down.

#### CYNOGLOSSUM MONTANUM.

This, the Hound's-tongue, is a British plant, not unfrequently met with in its wild state, and worthy of cultivation in gardens. The flowers are borne on stems of from 15 to 18 inches high, and are produced in drooping or pendent racemes, and are of a deep bluish-purple tinge. It may be raised from seed sown early in the autumn or the following spring, and treated as ordinary biennials, and should be grown in a light, well-drained soil. *J. Horsfield, Heytesbury, Wills.*

## FOREST PRODUCE OF BORDEAUX.

The British Consul at Bordeaux, reporting on the forests of his consular district, says that the Pine forests cover about one-third of the Department of the Gironde, and consist almost entirely of the *pin maritime* (*Pinus Pinaster*), which have to a great extent been planted in recent times in the Landes district, the soil there being unadapted to any other kind of cultivation. The two chief products obtained from these forests, viz., wood and resin, have now become an important, and in some instances the sole source of revenue of the inhabitants of those districts.

In the parts distant from towns and other inhabited places it is the production of resin which is principally resorted to, whilst in others which are nearer to Bordeaux, or other ports of shipment, or to means of transportation, the production of pit props, railway sleepers, telegraph poles, and wood for fuel, forms the chief business.

The collection of resin affords a living to a large number of the very poorest persons, and the recent decline in the exportation of this article from Bordeaux—which about twenty years ago was very extensive—has, therefore, been a great misfortune to the inhabitants of some parts of the Landes districts. This decline has been caused by the annually increasing competition of the United States of America, which country, since the conclusion of the Civil War, has become the chief exporter of resin to London, Hamburg, and Antwerp, to the almost entire exclusion of Bordeaux, which used formerly to send considerable shipments to the ports mentioned.

#### PINE OIL.

A new kind of oil under this name is now made from the refuse of resin after the same has been employed in making turpentine. This Pine oil is used at Bordeaux in some private houses as a lighting material, and burns very brightly; it is cheaper

than refined petroleum, and free from explosive properties. The Pine trees do not appear to suffer from the extraction of the resin, providing it is done carefully; indeed, it is stated that the wood of such trees is better fitted for certain purposes, such as paper-making, and for making pyroigneous acids, than when the resin is not extracted.

Comparatively few other trees of any height besides Pines are to be met with in this Department excepting in private parks and gardens; amongst these kinds the Oak and Elm are the most common. Oaks are grown in considerable quantities all over the country for fuel in private houses at Bordeaux and elsewhere, for in spite of coal being less expensive, it is but little used for heating purposes. Small sized Acacias and one kind of Willow are grown largely for props for the Vines, and two other kinds of Willow, *Salix viminalis* and *S. vitellina*, are cultivated—the former for use in basket-making, and the latter for making barrel hoops. Both kinds are exported to the United Kingdom; barrel hoops from this district especially are much in demand in Scotch ports engaged in the herring trade.

## MARKET GARDENING.

### "THE CREWE," KENILWORTH.

OCCASIONAL brief paragraphs referring to Strawberries or Mushrooms have suggested to the public that Kenilworth is developing an important gardening industry. Probably few are aware, however, of the extent to which fruit and vegetables are grown for sale in this neighbourhood, or of the perfection to which market gardening has been brought. It is not too much to say, that in recent years, the market gardening business has been revolutionised, great skill and intelligence having been devoted to the raising of garden produce, and railway companies have, generally speaking, applied themselves to the task of conveying perishable commodities all over the country with greater rapidity than formerly. Probably the purchaser at Manchester of a pound of Mushrooms would be surprised to learn that but a few hours previously the edible was growing a hundred miles away; and a similar customer in Birmingham would be not a little startled were he told that but an hour previously his purchases were growing in fields near to the Castle ruins at Kenilworth.

Villiers Hill, on which "The Crewe" is situated, was formerly a part of the domains of the Earl of Clarendon, but it was a few years ago bought by Mr. C. F. Treplin, of Wootton Court—where, by the way, is one of the finest collections of Conifers to be seen in the Midlands. Situate about a mile from Kenilworth Station it is approached through a charming country road running into what is known as Glasshouse Lane, and from this lane an occupation road leads through a couple of fields, after passing the first of which the market garden ground is observed. Immediately on passing the second gate the cart-road is perceived to be lined with Mushroom hills. Remembering the character of some of the kinds of fungi which grow even in the Midlands the visitor may well be wary; but the field being freely spotted with these white domes suggests that, early in the season as it is, these must also be Mushrooms. Mr. Murdoch, the market garden manager, is an experienced horticulturist who has been with Mr. Treplin seventeen years, having laid out the grounds and plantation at Wootton Court, and the state of "The Crewe" gardens bears abundant testimony to his ability and good management.

Mushrooms are grown likewise in a long, low shed, in which, by means of a little heat afforded by a flue, a supply is obtained in the winter. The beds, which are raised to the height of several feet, were freely spotted with "buttons," though a large quantity had been picked during the day. Barns and other out-buildings are filled with numerous other beds in like condition and in almost every conceivable situation, even some old cowpens being utilised for Mushroom culture. In the greenhouses are to be seen some

Tomatos of splendid size and colour. In another house Cucumbers hang in plenty, and in the vineries the Vines give promise of an abundant supply of fruit. The cut flower business is an important department at "The Crewe," and among the subjects grown is a *Maréchal Niel* Rose, from which a thousand choice blooms were cut in Easter week.

While other farmers have been failing, financially speaking, in ordinary agricultural pursuits, Mr. Treplin has turned to fruit farming apparently with great success. Though the distance from the railway station is somewhat of a drawback, the situation of this flower, fruit, and Mushroom farm is almost all that could be desired, and the area of land under cultivation is being extended. The markets at Birmingham, Coventry, and Manchester draw from this source large supplies. Last week of Mushrooms alone an average of 100 lb. a day was sent off, with an extra 100 lb. on Saturday, and on Monday last over 270 lb. were consigned to different dealers, a large quantity being consigned to Manchester by the night trains. The Mushroom business is now at its full, being this year remarkably early—the atmospheric and other conditions having been so favourable as to have advanced the season for meadow Mushrooms by six or eight weeks.

Kenilworth has acquired a reputation recently for Strawberries, a tremendous quantity having for some years been sent to market. Of the 21 acres of gardens at "The Crewe" 8 acres are appropriated to Strawberry beds, and last year during the season as many as 1000 lb. a day on an average were picked. This year the general supply may not be so large—in fact, it is expected to be under an average year for quantity. Owing to the extraordinary drought of last year the plants did not ripen their crowns. There are consequently fewer flower-spikes, but it is some consolation to know that the quality will probably be all that could be desired; the plants look healthy and strong, and there are hopes of a fair crop of very fine fruit.

A plantation of Cherry trees, an acre in extent, was noted; as also a very fine plantation of Currant bushes. Plums and stone fruit generally is expected to be a comparative failure. In this connection, however, Mr. Murdoch has some cause for satisfaction, and he is not indisposed to refer to it. It is generally considered to be prudent to plant stone-fruit trees in low situations; Mr. Murdoch, however, some time ago planted trees on 30 acres of upland—the situation being considerably elevated. The idea was condemned—it was generally believed that he was making a great mistake, and it was prophesied that the Plum trees especially would never do any good. It is a remarkable fact, however, that this orchard has enjoyed an almost total immunity from blight, the trees having been slightly touched. On this hill the trees are laden with heavy crops of fruit, healthy, and bright-looking—a complete contrast to the state of the trees in sheltered situations. Large quantities of Cucumbers are grown at Kenilworth—one gardener making them a speciality. *From the "Coventry Herald and Free Press."*

## NURSERY NOTES.

### ORCHIDS AT MESSRS. HUGH LOW & CO.'S, CLAPTON.

THAT latest novelty, *Cypripedium bellatulum*, illustrated at p. 747 of our last volume, may, at the present time, be said to be the great attraction at the Clapton Nurseries, the plant being a lucky introduction of this firm. Six large houses are entirely filled with established *Cypripediums*, and four more are in the course of filling with more recently introduced species, such as *C. Godefroya*; but among the whole of the numerous kinds of *Orchid* none are so noticeable as *C. bellatulum*, a great quantity of which is in bloom, and among which some new and handsome varieties are to be found; one has already been certificated as *C. b. roseum*, and now there appear others with pale yellow ground, and one with ivory-

white flowers blotched with pale pink. As a new plant *C. bellatulum* is undoubtedly the plant of the year, as far as the present time. Among the *Cypripediums*, a houseful of *C. Lawrenceanum* gives a great show of bloom; a large quantity of *C. Sanderianum* exhibits that fine plant; and *C. Argus*, *C. ciliolare*, *C. Stoney*, *C. Lowii*, *C. Veitchii*, *C. concolor* Reigieri, *C. Parishii*, and several forms of *C. barbatum*, and of *C. b. navium* is the best, are also in flower.

The *Cattleyas* and *Laelias* seem to improve in vigour and condition here every year. So many houses are filled with them, that it is no light matter to go the full round. Luckily for the visitor, the best of those which are in bloom are brought to the ends of the houses. The Mossie-house exhibits some fine forms, distinguished by their broad, open, and richly-coloured labellum. Some handsome forms in the way of *C. M. aurantiaca*, with orange-coloured throats; and *C. M. Reineckiana*, with white or pearly-tinted petals, are also very attractive. *Cattleya Mendellii* also give a grand display; some plants have pure white petals, with only a rose-coloured mark on the labellum; some white, with rich carmine lips; and some have large pale rose flowers, with large and frilled crimson labellums, like that of *C. M. Rothschildiana*. The variable *Cattleya Gaskelliana*, with its fine fragrant flowers, gives in a good importation varieties which resemble almost all others of the large-flowered *Cattleyas*. In all importations, however, the bulk of the varieties are pale, which makes the more intense-coloured forms of this section of more value than similar forms of *C. Trianae*. Messrs. Low have two superb varieties of *C. Gaskelliana* which closely resemble fine forms of *C. exoniensis* ×, so richly coloured are their labellums; another is almost identical with a well-grown autumn-flowering *C. labiata*, and a fourth has large white flowers with the barest suspicion of a pearly tint over them—a very beautiful form. Other varieties appear with the mottled lip of *C. Mossiae*, and, indeed, innumerable other odd and pretty variations.

Many *C. gigas*, some *Laelia purpurata*, *Cattleya superba*, and other showy Brazilian plants, are in bloom in the intermediate-houses; and the *Odontoglossum*-houses have sufficient plants in bloom to show the excellent quality of *O. crispum* and *O. Pescatorei*, which have yielded such fine hybrids.

*Vandas*, *Aërides*, *Angraecums*, *Saccolabiums*, &c., are grown in great quantities; among them *Vanda Amesiana*, which has tall spikes of rosy flowers, almost identical in appearance to those of *Phalaenopsis Lowii*, may be said to be the best new plant. *Vanda teres*, *Saccolabium Blumei*, and others are in bloom; and among the houses of well-grown *Phalaenopsis* the new paper-white *P. gloriosa* stands out very distinctly among good sprays of *P. Sanderiana*, *P. amabilis*, *P. grandiflora*, *P. Schilleriana*, and *P. Luddemanniana superba*.

The *Dendrobium*-houses have hundreds of well-flowered plants of the charming *D. Bensonae*, *D. Parishii*, *D. rhodopterygium*, *D. Dalhousianum*, *D. cambridgeanum*, *D. suavisimum*, *D. hercoglossum*, *D. tridatum*, *D. crystallinum*, *D. transparens*, &c. The *Masdevallias* have a fine show of varieties of *M. Harryana*, exhibiting very fine forms, especially among the scarlet and crimson colours. With them *M. racemosa*, *M. ionocharis*, and other odd species are in bloom, and in other cool houses *Lycastes*, *Oncidium*, *Sophrontes*, &c., have many things in flower.

#### ORCHIDS AT MESSRS. VEITCH'S, CHELSEA.

The English raised hybrids become more numerous and interesting year by year, and seldom can one visit the nurseries without finding something to admire or something instructive. One of the most remarkable hybrid *Dendrobiums* is now in flower, viz., *D. porphyrograstrum* ×. The sepals and petals are pale pink, the lip rose-purple. The flowers are not of a large size, considering it is a cross between *D. Huttoni* and *D. Dalhousianum*. With it was another hybrid raised at Chelsea—*D. rhodostoma*, ×

*D. Huttoni* × *D. sanguinolentum*. It is a very pretty thing, with white sepals and petals, and lip purplish tipped. The pretty *Thunia Veitchiana* was flowering very freely. It is quite an acquisition, combining, as it does, the characteristics of its parents—*T. Marshalliana* and *T. Bensonae*. *Cypripedium Tautianum* × was in flower. It is a distinct and pretty hybrid. The sepals are flushed with purple on a white ground. The lip is rosy-purple. It originated by crossing *C. barbatum* and *C. niveum*.

Many good varieties of *Cypripedium* were in flower, and it was observed that the best of them are hybrids raised in the nursery. *C. grande* × is the most striking of them. *C. Harrisianum superbum* is a fine form of this well-known hybrid; *C. superciliale ornatum* is quite distinct and handsome; *C. conchiferum* × is also a vigorous and striking hybrid; so also is *C. selligerum majus* ×, a much superior form. In the *Cattleya*-house was found, although so late, a good display, comprising *C. Trianae Mendellii*, *C. Mossiae*, *C. Gaskelliana*, *C. gigas*, *C. Forbesii*, and *C. Schroderi*. The pretty little *Angraecum falcatum* was profusely covered with its pure white sweetly scented flowers. *Pholidota imbricata* is very curious, with its pendulous twisted spikes of brownish-coloured flowers. *Burlingtonia fragrans* is also very charming, the flowers sweet-scented, and pure white, the crest on the lip being yellow. *Broughtonia sanguinea* had also flowered freely, and amongst *Dendrobiums* one of the most lovely was *D. Bensonae*, plants of which were flowering freely; its spikes of white flowers, which have a distinct blotch on the lip, are charming. Specimens of *D. Jamesianum* were very striking; *Cypripedium bellatulum* was observed in quantity and in good variety. For the last week in June we have rarely seen such a good display in these nurseries.

#### LIFTING AND STORING DAFFODILS.

I WOULD like to say a few words upon this very important subject, at a time when those bulb growers who make *Daffodils* a specialty will be turning their thoughts in the direction of the subject of this note. It is no small matter—I speak from experience—and is as important as it is considerable.

Some little time since Mr. J. Walker, of Whitton, gave a very interesting paper on *Daffodils* generally, and in the course of his observations touched—though far too lightly—on the matter of lifting and storing them. As regards the lifting, I was under the impression, until I read Mr. Walker's remarks on the subject, that there was but one generally accepted opinion respecting them, viz., that they are best left undisturbed for several years. Nurserymen who grow these largely are compelled to set this dictum aside, and in many cases to lift their stocks annually, in order to secure a sufficiency of saleable bulbs. But if I read Mr. Walker's remarks aright I believe I am correct in concluding that his observations are intended to be for the well-being of the bulbs themselves, rather than the expense entailed by the operation. I confess, however, I cannot quite reconcile the following passages of the paper in question:—"It will be found that some varieties will require to be lifted every year, while others may remain in the same spot for a number of years, and do well;" and then follow the somewhat conflicting observation—"If it were not for the labour and expense it would entail, I would lift all my bulbs every year." It is to be regretted, in looking at the first quotation, that Mr. Walker, with his wide experience in these matters, had not named a few each of those kinds which are benefited by annual lifting, and also those that are benefited by being left alone. But taking into careful consideration Mr. Walker's reasons for not lifting annually, it reduces the weight of the first quotation to a minimum. In your issue of April 23, p. 524, Mr. Murphy, of Clonmel, in reference to this subject, asks, "Is the evidence in favour of lifting every year?" To which I reply, from an all-round point of view, Certainly not;

nor can I see that Mr. Walker's statement is sufficient proof that annual lifting is beneficial. The result of annually lifted stock is always different at a glance against those that have remained undisturbed for two or three years. There is a lack of vigour and natural boldness, and particularly is this noticeable in such things as *Ard Righ*, *spurius* varieties, the *bicolors* generally, *Emperor*, *obvallaris*, *ornatus*, *poeticus* pl., and many more. The kinds I have named I would never think of disturbing under three or four years at the least, and the last two will go on for some years longer, improving annually. We have had nothing finer this year than our *Horsfieldii*, which has not been disturbed for two seasons, while *Emperor* and *Empress* have produced magnificent blooms; the former still carrying foliage nearly 2½ feet long—a vigour to which annually planted stock is foreign: the same thing affecting in a corresponding degree a great number, if not all of them. Some weeks ago I took out a few "rogues" of *nobilis* and *obvallaris*, the former having been in the ground three years, and the latter four; the blossoms of the first-named were a credit to its title, and the latter I have never seen finer blooms; the stems, however, will furnish some idea of their great strength when left alone, many of these being upwards of 16 inches from the ground line to the point where the trumpet assumes a horizontal direction: against this our annually lifted stock of *N. obvallaris* rarely exceeds 10 inches high, the flowers being proportionately smaller. As a whole I think there are few which improve more by letting alone than the double sorts, and the invaluable *N. ornatus*. Two years since I planted a batch of the former which have not been disturbed since, the first season after planting they produced very few flowers, this year the number of blooms was increased considerably, still many went blind in the scape. This blindness will, I think, diminish annually, as I notice a good percentage came from the "breeders," and no doubt were from the offsets. I imagine the Continental growers dry this variety much in the sun, by the colour of the skins, and those who plant it largely from imported bulbs can tell how many blooms they get per 1000 bulbs in a very few seconds during the first two or three years. *Albicans*, the *cernuus* forms, *Sulphur* and *Orange Phoenix*, I would not hesitate leaving alone four or even five years—more if they had ample room when planted. Some years ago, when in charge of Mr. Latimer Clarke's garden at Sydenham—at which place a very extensive collection of hardy bulbs was then to be found—there existed some fine clumps of the best *Daffodils*, among other things; these had been planted many years in a prepared bed, and finer flowers I do not remember seeing of such as *Emperor*, *Empress*, and *bicolors* generally; *maximus* exceptionally fine, and near by *Iris cristata* bloomed regularly with remarkable freedom. On the whole, I fail to see what advantage it would be to lift annually, presuming the stock was not required for commercial purposes, while the labour item would be serious indeed.

In cases where lifting and planting are necessary, I would strongly urge upon all the necessity of early planting, as I feel convinced that the longer they are kept out of the soil the more they deteriorate. Only last week (June 15) we had a flower of *Emperor* expand from a bulb (one of five) planted in January; it was barely 6 inches high, the leaves about the same; surplus stock planted in November reached 10 inches high, whilst those left alone have attained a vigour of which this alone can boast. This experience points directly to deterioration as the result of lifting and keeping dry, and where deterioration follows the lifting in any bulbous plant, it certainly cannot add to its benefit.

Mr. Walker evidently has had experience in deterioration judging by his remarks on storing—evidence alone that a certain amount of stamina is lost by exposure to foreign conditions. I can give my fullest support to Mr. Walker's statement on storing, for nothing is more destructive than to place them in bulk and so cause them to sweat and become mildewed: no practice is deserving greater condemna-

tion, followed, as it is, by such disastrous consequences. Where shed-room is insufficient for placing them in after lifting (and where a few acres exist this invariably happens) it is a good plan to spread them upon a vacant piece of ground, and place some lights over them supported on pots or the like, and to cover the lights with bags or mats. Sheets of corrugated iron are very good for the purpose.

Thus placed, a current of air passes freely over them, and, being kept free from sun, their ripening will be all the more gradual—a state of things much to be desired; then by removing the covers and turning the bulbs twice weekly the business of drying may be effectually carried out. I am of opinion that scorching sun upon the bulbs as soon as they are out of the ground frequently causes them to go blind, and should be avoided. *E. Jenkins.*

## FLORISTS' FLOWERS.

### THE AZALEA.

With very little trouble these showy plants may be flowered for half the year, for the late flowering varieties will continue to flower, especially if the season be a late one, well into July. The earliest varieties ought now to have finished their growth, and as soon as the buds are set the plants should be placed out-of-doors and watered carefully. The main point to attend to is to get the plants started into vigorous growth as soon as they have passed out of bloom. This is done by placing them in a warm house, syringing the plants well daily, and shading from bright sunshine; they must not, however, be placed out-of-doors from a warm house without being gradually inured to the cooler atmosphere outside, but they should be taken into a greenhouse, the lights of which must be kept rather close for a few days, more air being admitted by degrees. If a house can be set apart for the plants they may be there treated to hothouse temperature till growth is formed, the temperature being subsequently altered to suit the plants.

The latest flowering plants may be grown on now in a moist atmosphere, but they will not require any artificial heat further than what may be obtained by shutting up the house early in the afternoon, and allowing the temperature to rise by sun-heat. When the house is shut up in the afternoon the shading should be removed at once, when the temperature will soon rise in hot summer weather to 85° or 90°, and if the plants are well syringed there will be no danger of their being injured by heat, for the moisture which condenses on the glass will prevent this.

### THE AMARYLLIS.

These plants are still in active growth, and the careful cultivator will see that they are not injured by either too much or too little water. They are all the better for being kept in a stove at present, the house being shut up in the afternoon. Seedlings should now be growing freely, whether they are of one or two years old. Seeds which are now ripe should be sown at once, employing a little bottom-heat to start them, the seeds always vegetating best with the aid of the warmth and moisture obtained from fermenting materials. The heat should not be more than 80°, or the germ may be killed; in fact, I have seen seeds stewed by being sown in pots which were plunged over fermenting manure. That is an error which can easily be avoided by waiting until the violent heat subsides. The seeds soon vegetate, and after they have been above ground for ten days or so, the small plants may be pricked out, ten or twelve of them in a 6-inch pot. In hot weather, red-spider and thrips are very troublesome pests. Neither of them can be destroyed by fumigation, for tobacco-smoke does not destroy the spider, and the thrips fall down among the plunging material, soon to be up and feeding again amongst the leaves. Sponging the leaves with soft-soapy water seems to check them.

### PELARGONIUMS.

There are few easily-grown plants better adapted to furnish the house with bright flowers at this season than the various types of the Pelargonium. We have in our greenhouse the best of the large-flowered show type, and a few of what are termed decorative. The last-named are the best for giving large quantities of flowers; and the others flower freely enough too, but the flowers are better formed, and of the richest and most varied colours. Then we have the small-flowered fancy type, the single and double zonals, and the Ivy-leaved Pelargoniums, both single and double forms. The double varieties of these are amongst the best of the recent novelties in the large genus Pelargonium. The large long-stalked trusses of rose, scarlet, purplish, and pink varieties are most useful for cutting and decoration in the house. These varieties may not be so graceful as some of the single ones, but they are very enduring, while the flowers of the single varieties soon fall to pieces. Besides these there is a mine of interest in the Cape species and their varieties. One which is most useful and free in flowering is *occulatum* fl.-pl., with purplish double flowers lasting long in beauty; the good old Rollisson's Unique, tricolor, is a pretty little species, but it is rarely vigorous. The crimson species, Schottii, is very striking, as is also the Echinatum type. Those who once take up the culture of these Cape species do not care to give them up again. I have tried to cross some of them, but have not been very successful. Many persons leave the propagating of these plants until it is the time to cut down the whole collection in July and August; but the best plants are obtained from cuttings taken in May or June, and put in singly in 60's; they succeed best in this way. Success in growing them will depend upon the attention they receive; they should not be left in the small pots after they are well established, and care must be taken to keep them free from greenfly. Many persons looking through our collection of Pelargoniums say, "How do you manage to keep them so free from greenfly?" The only answer to this is, "Regular fumigations with tobacco up to the time the flowers begin to open." Afterwards it cannot be done, the tobacco smoke causing the blossoms to fall.

### THE CHRYSANTHEMUM.

I allude to these because I have just now finished the final potting the whole of my collection. This should always be done by the middle of June, and if done much earlier the pots seem to get too full of roots, and the flowers do not possess high quality. This remark applies especially to pot plants, as they require to be kept steadily growing from very early in the year. The Chrysanthemum now receives great attention as an exhibition plant—greater, indeed, than it has ever previously received, and the Japanese varieties introduced have effected quite a revolution in the appearance of our exhibitions, and the quality of the flowers of the incurved section has improved; at any rate, their size has increased; yet I am obliged to confess that there is no improvement in the quality of the plants. They are either over-trained by having the shoots twisted into a form that it would be impossible for the plant to take naturally, or they are grown without any training at all, the most conspicuous part of the plants being the long naked stems. There is no reason why the plants should be trained into the form of a pancake, on the one hand, or be allowed to become long and lanky, on the other. To keep the leaves in a healthy green state on specimen plants up to the time they come into flower requires skilful, careful treatment, and it can only be done by using potting soil of a substantial holding kind and good quality—not too rich, as an excess of vigour is very undesirable. A steady, good firm growth is best, as then the plants may be stimulated after the buds set by the judicious use of manure-water. The system of training is of importance, and should be such that the plants preserve, as near as can be, their natural habit. If a plant is by nature of a tall-

growing habit, why should it be made to appear as a dwarf? The great point is to keep the foliage clean and healthy, else large well-formed flowers cannot result. One flower, large in size and well formed, is preferable to half a dozen below the medium size, which are the usual produce of plants which have lost half their leaves.

A species of aphid distinct from that usually found on Pelargoniums and allied plants attacks the young shoots and sadly cripples them. When the plants are in frames this pest can be killed by fumigation with tobacco-smoke—out-of-doors that is impossible; but the plants may be cleaned in two ways—they may be laid on their sides if they are too large to be dipped, and be syringed with soft-soapy water in which some tobacco-juice has been mixed, or the insect may be destroyed by dusting the tips of the shoots with tobacco-powder. The plants, whether specimens or not, should be placed in an open airy position, not a draughty one, but if possible where they are protected from the north and east winds. *J. Douglas.*

## THE DELL, HYDE PARK.

### [SEE SUPPLEMENTARY SHEET.]

At one time the small park which abuts on the old Palace of Kensington contained much, if not all, that could be termed picturesque in that broad expanse of wood and glade called respectively Hyde Park and Kensington Gardens. At the present time, in so far as tree growth goes, and in the number, size, and age of the trees, and their disposition in natural looking groups and outlying specimens, the old gardens of Kensington afford the most satisfaction to the lover of sylvan scenery. Of late years, however, despite the havoc made by storms, considerable efforts have been made to add various features to the larger area—Hyde Park. Thus in the larger half of the Serpentine a projection has been formed and planted with shrubs and low trees—a doubtful experiment, as it destroys a fine bold sweep of water-washed bank, itself more effective than the now mutilated line. The kerb of granite round the Serpentine may have its utility, but it is an eyesore, and is less pleasing than a shore-line, water-fretted. The Dell, which we show in our Supplement this week, is a feature, very small certainly in extent, but one which is a great improvement on the bare steps of the overflow cascade from the Serpentine, bordered by equally bare rocks and common trees and shrubs.

In the early days of Her Majesty's reign, and for many years afterwards, the overflow water found its way by a muddy ditch to the mouth of a great tunnel, which conveyed the water under the high road at Albert Gate, and onward through Belgravia and Pimlico to the Thames. By widening the ditch and bordering it in a picturesque manner with masses of rock, shrubs, Iris, rushes, sedges, and other water-loving vegetation, its appearance has been quite altered, and what was once an ugly, swampy piece of ground has been made a "beauty spot." Water Lilies grow in the water, which is rarely stagnant, and water fowl add life to the scene.

In the summer time—when the view now given was taken—Musas, Cycads, Palms of various hardy species, and Dracænas, give a richer aspect to the vegetation which creeps up the sides of the embankment made across the valley to form the Serpentine.

## FORESTRY.

"THE FOREST FLORA OF SOUTH AUSTRALIA."—The eighth part of this publication is before us, consisting of folio coloured plates, representative of the trees of the colony, with popular and technical descriptions, indications of use, &c. The plants figured in the present number are *Eucalyptus pyriflora*, with large and beautiful pink flowers; *Acacia melanoxylon*, a handsome species, called Blackwood in South Australia, but Lightwood in Tasmania—a delightful illustration of the value of popular names; *Calli-*

stemon coccineus, a highly ornamental "bottle-brush," formerly more often seen in our conservatories than at present; *Exocarpus aphyllus*, and *Casuarina quadrivalvis*. The work is issued by Mr. Brown, the Conservator of South Australian Forests, and is very creditable to his industry and knowledge.

"Forest Flora of Cochin China."—M. Pierre's colossal undertaking has reached its 176th large folio plate; but that brings us no further than Bombax in Malacca. The plates are crowded with detail, and the botanical descriptions are very carefully elaborated.

## THE ALPINE GARDEN.

### NOTES ON ALPINES.

*Ramondia pyrenaica*.—In a recent number of the *Gardeners' Chronicle* Mr. Wolley Dod speaks of this pretty alpine. I have plants of this collected by myself in the Pyrenees, in various aspects. Have any of your correspondents been struck by the fact that this plant, when apparently absolutely dead from drought, has a singular power of recovery? Some of my plants, in a dry rockwork with due south exposure, during the last exceptionally warm dry summer, were shrivelled up, looking like bits of dry green flannel, and I gave them up for dead. Since the winter they have (like the *Anastatica*) swelled out and assumed their normal form of a spreading rosette of leaves, and they, moreover, bloomed early—in May—and with flowers of good size and form. Another plant I have planted in what I may call a miniature cave with a northerly exposure and moist soil, has now a rosette of leaves a foot across and has bloomed well although a month later than the plants in a drier and more sunny site.

*Habertea rhodopensis*.—I do not find this plant increases fast, in fact it is of extremely slow growth with me. My single plant bore three spikes of its pretty flowers last year, but this year I have not one.

After *Primula nivalis*, with its spotlessly white, dense heads of flowers, the gems this season have been, I think—

*Edraianthus pumilio* and its still more lovely congener, *E. serpyllifolius*, both of which seem to have enjoyed the prolonged drought. *E. dalmaticus* is not yet in bloom.

*Cuscuta coccinea* has bloomed with me for the first time, and is a worthy rival of *Heuchera sanguinea*.

*Campanula Allioni* and *C. pulla*, *Githionema corniculifolium*, *Potentilla nitida*, *Rosa pyrenaica*, *Arnica montana*, *Erigeron aurantiacum*, and a host of Saxifragas make the rock garden at this season an intense pleasure to those who, like myself, appreciate the beauties of Nature rather than those of purely artificial gardening.

### PRIMULA RUBRA.

In this we have quite a gem, resembling *P. Parryi*, but smaller. The stem is slightly pubescent; the leaves rather fleshy, oblanceolate, 2–5 inches long, and serrate. The flower-stalk is a span high, two to six flowered; the calyx mealy and reddish; the corolla deep-crimson-purple, with a distinct lemon-yellow eye. This plant, like *P. Parryi* and *P. suffrutescens*, loves a spot where the light is subdued by the margin of running water, or it will succeed fairly in an ordinary bog bed. *J. T.*

## PLANTS AND THEIR CULTURE.

*Spathmannia africana*.—Plants which were cut back as they went out of bloom and have since broken into growth, will be benefited by being turned out of their pots, and as much of the old soil and roots removed as can be done with safety, repotting them in a loamy compost, putting them for a short time afterwards in a cool house; and if slight shade in bright weather and a moist atmosphere can be afforded them, this treatment will accelerate their progress, and as soon as a little new growth is made more air must be gradually given so as to prepare

them for exposure out-of-doors. Here they will make closer jointed shoots than when grown indoors during the summer. Young plants spring-struck should be attended to in the way of shifting, and when large enough be placed out-of-doors. The small plants are very hardy, and effective for arranging with small groups of plants, or for standing on the side stages of the greenhouse.

*Eupatoriums*.—Cuttings of these winter bloomers already rooted should be potted up, subsequently pinching the points out until the required bushy habit is obtained. If there be any deficiency of stock more cuttings may be still put in, and with the usual attention to shading, &c., they will soon root. A cool frame is a capital appliance in which to grow *E. riparium* and *E. Weinmannianum*, but *E. lanthum* and *E. atro-rubens* do better where they can be accommodated with a few degrees more heat. The last two mentioned species are frequently seen under the name of *Hebeclinum*.

*Erantemums*.—These plants may be conveniently divided into two groups—one grown for their foliage, the other for their flowers. It is of the latter I wish to speak. Perhaps no species is better known than pulchellum, the plant with flowers of a rich blue colour, and appearing in the winter. Young stock should be potted on, and placed in a light and airy house, with an intermediate temperature. One of the most continuous flowering species is the pure white *eboracense*; it has a compact and neatly branching habit, and if large pieces are put in as cuttings, they commence flowering soon after they become rooted, and are more or less in flower throughout the year. *E. Cooperi* is a neat-growing species, with prettily marked flowers; but perhaps the showiest species is *E. cinnabarinum*, which has long panicles of vermilion-coloured flowers, and which are produced in spring and early summer. This species, after flowering, should be pruned hard back; any of the shoots so cut off, which are suitable, may be put in as cuttings, and as soon as the old plants break they may be turned out of the pot, the part reduced, and repotted. *E. Andersoni* and *E. hypocrateriforme* are likewise worthy of being grown for variety. All the species like an intermediate temperature, with a considerable amount of ventilation, and a rather free, light soil, frequently syringing them during their growth. *F. Ross, Pendell Court.*

## FRUITS UNDER GLASS.

**MELONS.**—Maintain a dry, warm atmosphere in the house where the fruits are colouring. In dull weather this will have to be done by artificial heat; 75° to 80° is a suitable temperature during the day-time with air, and also at night. Plants which are swelling a heavy crop of fruit should be assisted with some weak stimulant each time that they are watered, but heavy waterings with strong manure-water should be avoided, as it tends to produce over-large fruit and loss of flavour. Continue to make fresh sowings once a fortnight.

**Cucumbers** in full bearing may be occasionally watered with weak manure-water, but a top-dressing with loam, leaf-mould, and well rotted manure, with an occasional slight sprinkling of Thomson's manure will do just as well to preserve the plants in vigour. Avoid cropping heavily, and sow seeds for a late autumn supply—this had better be done in some structure where artificial heat is available.

**Pines.**—Plants which are ripening their fruit should now receive more air, and the atmosphere be kept drier. Damp the paths and walls once a day, but do not syringe the plants overhead. Pay every attention to plants swelling their fruit, and do not allow them to become dry at the root, or, on the other hand, to be over-watered. Syringe slightly overhead at shutting-up time all such plants, and well moisten all surfaces twice daily. If the day be very warm, damp down with a watering-pot and rose about 1 p.m., allow the temperature to run up to 55° after the house has been closed for the day, but ventilate slightly by the top ventilators after 6 p.m. for the night. Remove all the gills from the base and crown of the fruits, and reduce the number of suckers on each plant to two. The plants which were rested during the past month should now have the temperature raised to induce them to start into fruit; water sparingly until such time as signs of starting are observed, but do not allow them to become so dry as was recommended for earlier started plants.

Succession plants which were potted in spring will have made good progress, and if all has gone well, their pots will be well filled with roots. Every care must be taken to keep them in a healthy moist state at the root, as the slightest check from over-dryness will cause them to start prematurely into fruit. Gently dew over the growing stock every afternoon, when the house is shut up, letting the temperature range from 70° to 75°, and but little artificial heat will be required to keep up this temperature, unless it be during dull days or cool nights, to keep up a circulation of air. When it is necessary to apply fire-heat, see that the heat in the apparatus has been turned off ere the sun falls on the house the next day.

Suckers potted in the spring will now be ready for shifting into their fruiting pots, and as they are potted they should be plunged in their proper division. This should have been thoroughly syringed all over with a strong mixture of petroleum and water, the wood and glass well scrubbed with a brush and soft-soap afterwards, and the walls washed with freshly slaked lime-wash into which some flowers of sulphur have been put. In placing the plants, 2 feet from centre to centre will be the proper distance apart for Queens, Enviles, and other moderate growers.

**Suckers.**—Towards the end of the month suckers may be put in from the general stock on the stools from which the early Pines have been cut. Although this is usually done it is preferable to be constantly putting a few suckers in as they become large enough. In potting suckers remove a few of the scaly leaves from the bottom sufficiently high to set free the embryo roots, which are of brown colour—but no higher. The bed into which these are to be plunged should receive some additional fermenting material to raise the bottom-heat to 90°, the inside having been cleaned previously. The suckers should be slightly damped overhead with a fine-rose watering-pot at shutting-up time, and shaded during the warmest part of the day if the weather is bright. *W. M. Battie, Luton Hoo Gardens.*

## THE HARDY FRUIT GARDEN.

**THINNING.**—When Apricots, Peaches, and Nectarines have finished stoning the fruits should be finally thinned. Apricots, generally speaking, are rather a precarious crop, and when the flowers do set well many people are induced to allow the trees to carry too many fruits, exhausting the trees, and which then require the next season or two to recover. Leave the fruits a trifle closer together than is the rule with Peaches. Remove all badly situated fruits, and also those that are in contact with the wall nails, or else remove the nails, otherwise they will cause gumming. The large early Apricot always repairs for being liberally thinned, and if the trees are kept well watered the fruits produced are equal in size to those of a Peach. After the thinning is completed give the borders a thorough soaking of water, to assist the fruits in swelling off, but when heavy rains have fallen this will not be necessary. Should the walls have fixed glass copings the border must be watered in any event.

**Peaches and Nectarines** must also be well thinned out, leaving the remaining ones well placed, exposed to the sun, and as evenly distributed over the tree as possible. The remarks as to the watering of Apricot borders apply here.

**Netting.**—The mid-season Strawberries, red and white Currants, and the later varieties of sweet Cherries should be netted over. Where Gooseberries and Currants are in demand late in the season as dessert fruits, spread some long straw or litter under the trees to prevent the fruit from being splashed with mud. A few trees should always be grown on a north wall for dessert fruits. On a north aspect Currants will hang in good condition till late in November. *A. Ward, Stoke Edith Gardens, Hereford.*

**CARNATION R. H. ELLIOT.**—Messrs. LAING & MATHER, Kelso, send us blooms of their new Carnation, which flowers freely at Kelso both in and out-of-doors. The flowers sent to us are fragrant, of good size, even petal, and very double. The ground-colour is a pale ochrey-yellow, freely striped with rose-coloured stripes, and the calyx is not split. We should give it a good place as a border Carnation.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.** NOTICE to Correspondents, Advertisers, Subscribers and others. The Registered Address for Foreign and Inland Telegrams is "GARCHRON, LONDON."

**NOTICE to SUBSCRIBERS and OTHERS.** Post-office Orders and Postal Orders should be made payable at the Post Office, No. 42, DRURY LANE.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### MEETINGS.

MONDAY,	JULY 9	—Chambre Syndicale of Ghent.
TUESDAY,	JULY 10	—Royal Horticultural Society: Science, Life, Fruit, and Floral Committees.
THURSDAY,	JULY 12	—Edinburgh Botanic Society.

#### SHOWS.

TUESDAY,	JULY 10	Ipswich, Twickenham, Gloucester, and Oxford.
WEDNESDAY,	JULY 11	Glasgow and West of Scotland, Eding, York Florists', Bedford, and Tisbury Wells.
THURSDAY,	JULY 12	Chiswick, Winchester, Birmingham, and Carlton-in-Workop.
FRIDAY,	JULY 13	New Brighton, Manchester, and Eltham.

#### SALES.

MONDAY,	JULY 9	Established Orchids, at Protheroe & Morris' Rooms.
TUESDAY,	JULY 10	First portion of the Downside Collection of Orchids, on the premises, Downside, Leatherhead, by Messrs. Protheroe & Morris.
WEDNESDAY,	JULY 11	Nursery Stock, at Messrs. Ewing & Co.'s Sea View Nurseries, Hants, by Messrs. Protheroe & Morris.

Why flowers are what they are.

THE majority—probably a large majority—of flower-lovers are content to admire flowers as they are, without troubling themselves with

speculations as to the reason why and how the flowers have assumed the shapes in which we now see them. TOPSY's answer, "Spect they growed," represents the attitude of such folk. It is not necessary to point out how much such people lose, but it is, nevertheless, a matter for regret that so much intellectual pleasure, to say nothing of potential practical utility, is thus allowed to run to waste. Happily the waste has been very materially checked since the advent of the Darwinian era. Botany, which to many seemed a mere dry-as-dust sort of business, disfigured by a barbarous terminology and a sesquipedalian nomenclature, has been shown in its true light as a study which while capable of yielding the most refined pleasure, supplies excellent mental discipline and illustrates and explains many of the most profound phenomena of existence.

From such a point of view must be considered the Rev. GEORGE HENSLOW's recent work\*, which is devoted to the con-

sideration of how and why flowers present the diversities of structure and appearance which give us so much delight. Mr. HENSLOW's natural aptitudes for the work he has undertaken have been very materially aided by the facilities offered him in his post as Secretary to the Scientific Committee of the Royal Horticultural Society. This work, then, may in a measure be set to the credit of the Society to which Mr. HENSLOW has for many years contributed efficient aid. The causes which have been influential in making flowers what they are, are referable to two in particular—hereditary endowment and external influence. No one can impugn the statement, that plants, like other living beings, are, in a large measure, what they are because their predecessors and progenitors were so also; a child inherits, in very varying extent, the characteristics of his father and of his mother, they of their predecessors, and so on; and so also with plants.

In addition to these hereditary endowments plants are subjected to external conditions—they are, like the rest of us, dependent on circumstances—on the "environment," as it is now the custom to call the aggregate effect of the circumstances. But in their time the parents must have been submitted to varying circumstances, and so on till the very beginning of things—a period utterly beyond human ken. Some suggestion, however, of things as they were in the beginning and their subsequent course is offered in the progress of each individual living organism, plant, or animal, in its passage from a speck of protoplasm (itself a highly complex unit), to the fully developed state.

And so it comes to pass that the thorough investigation of the life history of any one plant or animal, pursued with all the niceties of research which modern chemistry, modern microscopes, and other instruments afford, throws light upon the course of events and the history of living beings generally, from the most remote to the present time, and shows how they have been influenced and modified according to circumstances.

In the work before us, Professor HENSLOW passes in review the chief variations in the form of the flower in the so-called flowering plants, arranging them according to the number of their parts, their mutual relations, their isolation or association, their form, their colour, and so forth. All this has, of course, been done before, and may be read in any text-book. The novelty of Professor HENSLOW's treatise consists in the explanations he affords of these phenomena, and in the suggestions he offers as to the causes producing them. Whether the reader agree with the author's conclusions, or whether he dissent from them, is a matter of relatively little importance. It is of the greatest value to have the phenomena presented to us so clearly in a new light, and their discussion from a new point of view, can hardly fail to be of great value to botanical science, while it will afford an infinite source of interest to the reader. Given the organism, and accepted the idea of its tendency to change, Mr. HENSLOW sets himself to the task of inquiring what caused it to change. He is not content with saying that the tendency is innate; that it changes because it is an attribute of the creature to change, or any such meaningless formula, but he endeavours to penetrate the reason why. This reason he finds in the "environment." PALEY's notion, we all know, was, that these wonderful and "purposeful" structures were "designed," and designed, no doubt, they were, but in a much broader and wider sense than ever PALEY dreamt of. PALEY's

views were of necessity limited and contracted. His notions do not go beyond the idea of a watchmaker with the materials made to his hand and ignore the source of both the watchmaker and of the agencies and materials which the watchmaker must employ or by which he must be influenced. Mr. HENSLOW, as PALEY would have done, revolts from the idea that these structures could be the ultimate result of any number of accidental and apparently at first purposeless variations, and looks to the "environment" as affording a better clue to the source of variations. Of course the "environment" is as much the work of Supreme Intelligence as the creature; and Mr. HENSLOW attaches a wider significance to the "environment" than DARWIN, or, at least, than some of his followers did, and by so doing he will no doubt disarm the opposition, which otherwise might be raised to his views. The general idea is that the form of flowers, or at least of such as are fertilised by insects, is due to a process of selection operating in this wise: A flower varies in some minute particulars—why, is not explained; one or more of these variations prove to be beneficial to the plant by facilitating the visits of insects, and thus by insuring more perfect fertilisation; the tendency to vary in that particular direction is enhanced as time goes on, and the relation between insect and flower becomes more and more intimate. Mr. HENSLOW's view is different. For him, the insect itself brought about the variation, in the first instance, and the variation has been perpetuated ever since by the repeated action of the insect. Still we do not arrive at the cause of the tendency to vary. The insect is supposed to set this tendency in action, but it can hardly be surmised that it originated the tendency. Willows, on Darwinian principles, should be wind-fertilised, but assuredly they are largely visited by insects, although these insects have not yet, by their weight or other agency, caused any modification of the flower, so far as we know, nor have they—if the Willow be assumed, for the sake of argument, to be a degenerate form of some previously more complex plant—succeeded in arresting its degradation.

We heartily commend Mr. HENSLOW's book to the notice of our readers, as containing an excellent summary of our knowledge of the conformation of flowers as illustrated by their perfect condition, their mode of growth and development from the initial stages, and their intimate anatomical structure, as well as by their comparative relations. The last sentence in the book we may quote in full, as condensing the author's contention into a sentence:—

"Having once attracted insects to come regularly [for pollen or honey], then a multitudinous series of differentiations would follow. The corolla would, in all probability, be the first to issue out of the bracts, as being the next whorl to the stamens; and as a result of stimulus; other changes already described under the principles of variation, would follow by degrees or in different combinations, but in every case they would be due to the responsive action of the protoplasm, in consequence of the irritations set up by the weights, pressures, thrusts, tensions, &c., of the insect visitors.

"Thus, then, do I believe the whole floral world to have originated."

**ROYAL HORTICULTURAL SOCIETY.**—Mr. C. J. GRAHAM, Assistant Secretary, sends us the following announcement:—"By direction of the Marquis of SALISBURY, Sir JAMES FERGUSON, Bart., M.P., writes to inform the Royal Horticultural Society that his Lordship has heard from the Austro-Hungarian

\* *The Origin of Floral Structures through Insect and other Agencies.* KEGAN PAUL, TRENCH & CO.

Ambassador that the Austrian Pomological Society is arranging a National Exhibition of Fruit to be held at Vienna under the patronage of H.H. the Archduke CHARLES LOUIS, from September 29 to October 7. Two sections of this exhibition will have an international character, namely, the section for fruit drying apparatus and that for machines and instruments used in cultivating and harvesting of fruit. Applications for space must be sent in on or before July 15, addressed to K. K. Oesterreichischen Pomologen-Verein, Lescwald, Graz." The Royal Horticultural Society daily expect to receive the programme of the Exhibition."

**THE SCIENTIFIC COMMITTEE.**—Two subjects of great interest and importance were brought before the last meeting, as will be seen in another column. Professor CHURCH detailed the results of his analyses in search of aluminium in plants, which he finds in Lycopodium, but not in Selaginella; so that the two genera are separated chemically, as well as morphologically. Moreover, while aluminium exists in the terrestrial species of Lycopods it is absent in those which grow removed from the soil upon trees. Some Tree Ferns are found to contain a very large percentage of aluminium in their ashes. Another remarkable communication was that of Mr. Plowright, in which he sent for exhibition the results of certain experiments on the "heterocism" of certain fungi, in virtue of which the same species of fungus is found to exist in two totally different forms, on two totally different plants; so that if the life-history were not known it would be impossible to consider the two forms of fungus (Ecidium or Cluster-cup and Puccinia or smut fungus) as stages of the same plant. So long as the statement rested on observation only it was open to question, but when the matter is practically demonstrated, as in these cases, there is no room for further scepticism.

**"KEW BULLETIN."**—The June number contains articles on the manufacture of quinine in India, on a particular form of Job's Tears (Coix lachryma), in which the seeds are elongated and cylindrical, instead of spherical, as usual. The grain is not likely to be of economic value as a source of food, but seems destined to be used as an ornament instead of glass beads. Other articles are devoted to Rhea fibre, and to the establishment of a botanical station at Lagos.

**THE GARDENERS' ORPHAN FUND.**—The usual monthly meeting of the committee took place at the Caledonian Hotel, Adelphi, W.C., on the 29th ult., Mr. GEORGE DEAL presiding, there being, as is usual, a good attendance of members of the committee. The Honorary Secretary reported that the sum of £60 18s. had been paid in during the past week, and the balance at the bank was £597 9s. A letter was read from Mr. JOHN FRASER, resigning the office of Auditor, stating that he should be engaged at Chester for some days which would prevent him from auditing the accounts for the forthcoming Annual General Meeting. Mr. FRASER's resignation was accepted, and Mr. C. H. SHARMAN was requested to act in his place. The Honorary Secretary reported that he had obtained returns of sums collected by the eighty local secretaries up to the end of June, the aggregate amount being £380 13s. 8d., which was regarded as an extremely satisfactory result. The highest sum returned by any one local secretary was that from Mr. G. W. CUMMINS, local secretary for the Carshalton district, which amounts to £33 4s. The aggregate expenses of the local secretaries are surprisingly small. The remainder of the sitting was occupied with details of the forthcoming Annual General Meeting, Election, and Dinner.

**ELECTION.**—There seems to be some misconception in the minds of subscribers to the above fund as to the number of candidates they can vote for at the coming election. Some five shilling subscribers are under the impression they can give but one vote to any one candidate, instead of being able to give one vote each to any six of the ten candidates. Or if

any subscriber is desirous of securing the return of any particular candidate, he can give one vote to that one, and refrain from voting for any other; but no subscriber of five shillings can give six votes to any one candidate, as votes are not cumulative, as in the case of School Board elections. For a ten shilling subscription two votes each can be given to any six candidates, and each additional five shillings carries an additional vote.

**HONOUR TO BRITISH HORTICULTURE.**—Prince DE CHIMAN, Belgian Minister of Foreign Affairs, has forwarded, by order of H.M. the King of the BELGIANS, the insignia of Chevalier of the Order of Leopold to Dr. MAXWELL T. MASTERS, Editor of the *Gardeners' Chronicle*, and Vice-President of the Jury at the International Exhibition of Ghent, in April, 1888.

**CONFERENCE OF FRUIT GROWERS.**—Arrangements are being made for a Conference of Fruit Growers to be held at the Crystal Palace, Sydenham, on September 7 and 8, 1888, in conjunction with the great fruit show to be held on those dates. The object is to concentrate attention upon the importance of extending and improving the culture of fruit in this country, and to elucidate by the means of papers contributed by practical men, and by discussion, the most profitable methods of developing this industry. It is proposed that the questions to be discussed shall include the profitable culture of fruits for market and home supply, the packing, carriage, and sale of fruits, their economic importance and utilisation. The Directors of the Crystal Palace Company will afford every facility for the proposed Conference, and assist the promoters in rendering it of national utility. All communications should be addressed to Mr. WILLIAM EARLEY, Ilford; or to Mr. LEWIS CASTLE, Hotham House, South Wimbledon, who have consented to act as Honorary Secretaries to the Conference. The following committee has been formed to carry out the project, and a fuller programme will be published shortly:—

#### Committee.

(Members to whose names an asterisk is prefixed will constitute the Executive Committee, with power to add to their number.)

- W. Allan, Gunton Park Gardens, Norwich.
- J. Austen, Witley Court Gardens, Stourport.
- J. Bannerman, Blithfield Park Gardens, Rugeley.
- \*E. J. Baillie, Woodbine, Upton Park, Chester.
- R. N. Brotherton, Tynningham Gardens, Preston-kirk.
- H. Bennett, Shepperton, Walton-on-Thames.
- \*G. Banyard, Maidstone.
- E. E. O'Callaghan, 18, St. Bride Street, E.C.
- Stephen Castle, West Lynn Vineyard, King's Lynn.
- \*J. Cheal, Crawley.
- W. Child, Croom Court Gardens, Severn Stoke, Worcester.
- A. Christie, Warwick Castle Gardens, Warwick.
- H. J. Clayton, Grimston Park, Tadcaster.
- W. Coleman, Eastnor Castle Gardens, Ledbury.
- W. Cole, Feltham.
- T. Coomber, The Hendre, Monmouth.
- J. Cranston, Hereford.
- G. W. Cummins, Grange Gardens, Carshalton.
- H. Catbush, Highgate.
- E. W. Dance, Gosfield Hall, Halstead.
- J. Day, Galloway House, Garliston.
- \*A. Dean, Bedford.
- R. Dean, Ealing.
- J. Dean, Titsey Park, Godstone.
- W. A. Dickson, Chester.
- W. H. Diers, Ketton Hall Gardens, Stourport.
- M. Dunn, Dalkeith Park Gardens, N.B.
- W. F. Emptage, Hawkswick Hall, St. Albans.
- P. W. Fairgrieve, Dunkeld House, Dunkeld, N.B.
- Farrance, Chadwell Heath.
- \*S. Ford, Leonard's Lee Gardens, Horsham.
- Gleeson, Clumber Gardens, Worksop.
- E. Gilman, Ingestre Hall Gardens, Stafford.
- J. H. Goodacre, Elvaston Castle Gardens, Derby.
- \*J. Goldsmith, Kelsey Manor, Beckenham.
- \*G. Gordon, I. Stile Villas, Wellesley Road, Gunnersbury.
- E. Hall, Bol'on Hall Gardens, Bedale.
- \*W. G. Head, Crystal Palace.
- \*J. Hudson, Gunnersbury House Gardens, Acton.

- W. Iggulden, Marston House Gardens, Frome.
- W. Ingram, Belvoir Castle Gardens, Grantham.
- W. J. Jeffries, Cirencester.
- \*John Laing, Forest Hill.
- J. McIndoe, Hutton Hall Gardens, Gainsborough, Yorks.
- E. Molyneux, Swanmore Park Gardens, Bishop's Waltham.
- J. C. Mundell, Moor Park Gardens, Rickmansworth.
- R. Parker, Impney Gardens, Droitwich.
- William Paul, Waltham Cross.
- A. H. Pearson, Chilwell.
- C. Penny, Sandringham Gardens.
- \*T. Francis Rivers, Sawbridgeoworth.
- \*C. Ross, Welford Park Gardens, Newbury.
- J. Sheppard, Wolverston Park Gardens, Ipswich.
- J. Smith, Mentmore Gardens, Leighton Buzzard.
- William Thompson & Sons, Clovenfords.
- J. C. Wheeler & Sons, Gloucester.
- C. Whitehead, J.P., Barning House, Maidstone.
- W. H. Wiskar, Borough Market.
- R. Veitch & Sons, Exeter.
- J. Udale, Elford Hall Gardens, Tamworth.

**BOTANICAL MAGAZINE.**—The July number of this veteran publication contains coloured figures and descriptions of the following plants:—

*Macrotomia Benthani*, t. 7003, described as a stately plant, native of Western Himalaya. It is a hairy Echium-like herbaceous plant, with broadly lanceolate, ribbed hairy leaves and dense cylindrical spikes of numerous regular purplish flowers, each flower about an inch long.—Kew.

*Asphodelus acutis*, t. 7004.—An Algerian species with tufted long linear leaves, and numerous flowers in a terminal corymb, each flower about 1½ inch long, pale pink.—Kew.

*Illicium verum*, Hook. f., t. 7005.—The Star Anise of China has up to this time been considered to be the seed-vessel of *I. anisatum*, Linn., *alias* *I. religiosum*, Siebold and Zuccarini; but is now shown to belong to a different species, to which Sir Joseph Hooker gives the name *I. verum*. Star Anise is used as a spice, and is employed to flavour liqueurs, such as Anisette.

*Colonyne graminifolia*, Parish and Rehb. f., t. 7006.—A species with ribbed pseudobulbs, linear leaves, racemose inflorescence, with starry white flowers, linear lanceolate segments, and a narrow lip, yellow, with reddish-brown stripes, and recurved at the tip.—Kew.

*Cyperorchis elegans*, t. 7007.—A Himalayan Orchid, without pseudobulbs, with distichous linear leaves and dense terminal stalked, many-flowered racemes. Each flower is about 1½ inch long, yellow, cylindric, with linear lanceolate segments, slightly spreading at the tips; lip three-lobed, lateral lobes erect, median lobe scarcely longer, retuse, disc of lip marked with two raised keels.—Kew.

**THE "BOTANISCHE ZEITUNG."**—Professor Count SOLMS-LAUBACH, who succeeds the lamented DE BARY in his Professorship at Strasburg, will also in future conduct the journal above mentioned.

**VINE MILDW (PERONOSPORA).**—This must not be confounded with the Oidium which attacks the Vines, and which is kept in check by sulphur, the fungus in the present case being a mould closely allied to that causing the Potato disease. Sulphate of copper (blue vitriol) has been found very efficacious in combating it, or, rather, in preventing the germination of the spores (conidia). M. COIGNET, in the *Vigne Americaine*, recommends the use of a fine powder containing copper sulphate as preferable to liquid solutions, which necessitate nicety of manipulation, troublesome water-carriage and powerful spray pumps which readily get out of order.—inconveniences which do not apply to the distribution of fine powder by means of bellows. M. COIGNET's powder consists of precipitated sulphate of lime (gypsum), which is made to take up 10 per cent. of a solution of copper-sulphate. The result is a powder infinitesimally finely divided, in which part of the copper is reduced to the state of oxide, which acts slowly, and part remains as sulphate, which acts quickly. We trust that our experimenters will try the effect of copper sulphate

in checking the Potato disease should it reappear. As the fungus is, to a great extent, concealed within the tissues of the tuber, haulm, or leaf, no application of this sort could be expected to kill the fungus outright; but its spread and diffusion might be checked as it is in the case of the Vine. To those who might raise an objection as to the possible injurious effect of the copper on human beings, it may be said that in the case of the Vine no poisonous properties have been noted in the Grape juice, which contains infinitesimally small proportions, or none at all, of copper. In the case of the Potato there would be no fear of poisoning from the tubers, and if it be said that chickens or pigs might receive injury from eating the haulm, it may be urged in reply that these animals should under no circumstances whatever be allowed to eat diseased haulm, and thus propagate the disease.

**ROYAL BOTANIC SOCIETY.**—Last Wednesday evening the annual Evening Fête of this Society passed off successfully; as, although the weather had been threatening and showery during the day, the evening was quite fine. About 10,000 visitors attended, and Messrs. L. D. BERRY & Son's illuminations were as satisfactory as usual. Exhibits of table decorations were varied and numerous, and many fine bouquets, and arrangements of flowers for personal adornment, attracted much notice. Mr. W. PAUL, Waltham Cross, sent a fine bank of cut and pot Roses, and show Pelargoniums came from Mr. C. TURNER, Slough. Messrs. J. WATERER & Sons' Rhododendrons made a fine display; and Mrs. SOUTHAM showed specimens of her flowers dried in their natural colours.

**THE ITALIAN EXHIBITION.**—It is intended to hold periodical flower shows at this Exhibition. The first of these shows was held on Monday last, when a large gathering of plants and flowers was exhibited. Messrs. KELWAY, of Langport, had a great show of Peonies, Delphiniums, Gaillardias, and Amaryllis, which were very attractive. Messrs. CANNELL, Swanley, occupied a large space with double and single Begonias. The English Irises and Peonies from Mr. WALKER, Whitton, won many admirers. A large gathering of cut flowers, including most hardy flowers now in season, came from Messrs. BARR, Covent Garden; while Messrs. CARTER, High Holborn, had a large group of single and double Petunias in pots intermixed with ornamental grasses, the whole making a very attractive display.

**FLOWERING OF OSTROWSKIA MAGNIFICA.**—This new hardy plant is in flower for the first time, we believe, in England, at Messrs. VETTER'S nursery at Coombe Wood. The plants are 3 feet high, with whorls of leaves on erect stems; flowers 3 inches across, in form shallow, bell-shaped; colour white, flushed with purple—very beautiful. It will be shown at the Royal Horticultural Society's meeting next Tuesday.

**"FARM, FIELD, AND FIRESIDE."**—Under this alliterative title a low-priced agricultural journal is now published, and of which the second volume is before us. It contains a vast amount of information condensed into paragraphs, so much so, that many more letters of the alphabet than the three F's would be needed to furnish titles for the headings, Gardening, Housekeeping, Health, for instance. As is customary in similar publications, much of the paper is furnished by the readers themselves in the form of answers to questions.

**ENKIANTHUS HIMALAICUS.**—A loosely-branched Ericaceous shrub, with leaves and flowers aggregated at the ends of the branches. The mode of growth is peculiar, the branches being subjected to alternate arrests and accessions of growth, the consequence of which is that on the same branch there are relatively long intervals destitute of leaves, and these naked spaces are followed by short "spurs," bearing leaves and flowers closely crowded. The leaves are some-

what less than 1 inch in length, somewhat more than a quarter of an inch in breadth, with a short red petiole; blades membranous, oblong-lanceolate, green above, paler beneath, with a red midrib and a few scattered strigose hairs, margins with short recurved teeth. The flower-stalks are thread-like, recurved, rather shorter than the leaves, and densely covered with shaggy hairs. The flowers are bell-shaped, about the size and form of those of the Lily of the Valley, but dull red and streaked. The ten anthers are prolonged into long tails. The shrub is a native of the Eastern Himalayas, at heights of from 8000—11,000 feet, is figured in the *Botanical Magazine*, t. 6480, and described by C. B. CLARKE in HOOKER'S *Flora of British India*, vol. iii. (1882), p. 401. We have to thank the Curator of the Royal Botanic Garden, Edinburgh, for the opportunity of examining the plant.

**ANTWERP.**—It has been decided to inaugurate next year, in this city, an International Exhibition of Botanical Geography. M. DE BOSSCHERE, who took so active a part in the last Antwerp Exhibition, is the moving spirit in this case also, and is proceeding on the lines of M. HANSEN, of Copenhagen, who some years since carried out a similar Exhibition with success.

**CERTIFICATES.**—There exists at some of the foreign horticultural societies a practice of awarding certificates at one meeting and of rescinding, or confirming, and afterwards presenting them to the recipient at another. This allows of time for enquiry in doubtful cases. Were a similar opportunity for reflection and examination allowed some questionable awards might be prevented at the Floral Committee.

**"LIFE LORE."**—This is the name of a new monthly periodical devoted to natural history, and published by W. MAVER, 4, Essex Street, Strand, London. The articles are interesting, if not all very novel, and the magazine is well printed and appropriately illustrated.

**A LARGE CARNATION.**—Mr. SCAMMEL, gardener to Mr. H. M. HOLDSWORTH, Wilton, states that he has a Carnation (*Souvenir de la Malmaison*) which has several unusually fine blooms, one measuring 6 inches in diameter and 1 foot 6 inches in circumference, perfectly shaped. The plant was raised from a cutting two years since.

**OLD FRIENDS.**—MESSRS. LAING & MATHER send us from Kelso good specimens of the double white Rocket (*Hesperis matronalis*), a showy perennial not so much grown as it should be; and of the double yellow Rocket (*Barbarea vulgaris*), also an effective border plant, the flowers of which retain their beauty for a long period.

**LOW TEMPERATURE.**—Mr. W. H. DIVERS, Ketton Hall, Stamford informs us, that on the morning of Sunday, July 1, the minimum thermometer on the grass at Ketton registered 34°, and the minimum in a Stevenson screen close by it was 40°; but on June 25 and 26 a maximum of 81° and 84° was registered on each thermometer respectively.

## BERLIN NOTES.

THE florist shops, now that the reign of the Lily of the Valley has come to an end, have ranged themselves under the sign of the Rose, and every kind of Rose is in abundance, and only here and there Orchid flowers, but which are becoming more and more the favourites in Germany and will in a few years be decidedly fashionable. It may be of interest to our readers to know the quantity of Lily of the Valley employed in Berlin in the course of the past season. As is well known, the forcing of Lily of the Valley for Berlin and neighbourhood is a specialty, numbers of growers are to be met with who have land under this crop to the extent of 6½ hectares [over 14 acres]; but the quantities raised here by no means equal the demand of the metropolis, and wagonloads arrive almost daily, chiefly from Silesia, each of which

on an average contains 900,000 to 1,000,000 flower-spikes. The total quantity of Lily of the Valley will not be fixed too high at 25,000,000 to 30,000,000. The flowers are sold in bunches of ten at 15 pfennigen, as the lowest price; so that at the least 30,000 marks are spent on these flowers in the season. If we consider that the retail price of a Lily bouquet is 50 to 75 pfennigen, then the turnover must equal a sum of from 40,000 to 45,000 marks.

### MATURED FLOWER-POTS.

At the meeting on June 28 last of the Verein zur Beförderung des Gartenbaues some pots were shown made from the best kind of clay which had been mixed with from 13 to 15 per cent. of bone-meal, and then formed and burnt. After being taken from the kiln the pots were dipped in a bath containing 3 per cent. of sulphuric acid and ammoniacal potash, which was readily absorbed, and they were then allowed to dry. It was decided, at the request of the exhibitor, to test the value of the invention. Our *Berlin Correspondent*.

## DISEASE OF GARDEN HELLEBORES: PERONOSPORA FICARIE, Tul.

FOR two seasons I have been aware of a serious and destructive disease amongst garden Hellebores; last season my materials were too uncertain for publication—this year, however, the data have been abundant. Very early in the spring Mr. F. W. Burbridge sent me badly diseased examples from Dublin, with particulars as full as it was then possible to furnish. Since that time various correspondents have sent examples, and complained of the total loss of their garden Hellebores. A note from Mr. Burbridge well explains all the cases. Mr. Burbridge writes from Dublin:—"The Hellebore disease seems confined in this neighbourhood to Helleborus niger (Christmas Rose), and its garden forms or varieties. *H. niger maximus* (= *H. altifolius* of gardens, not *H. altifolius* of Heyne) seems especially to suffer from its attacks, although perhaps the most robust and vigorous member of the whole group. So far as my observations go, the petioles first become affected; a black-coloured spot or blotch appears and spreads, and encircles the leaf-stalk, after which the blackened portion deliquesces, and you see the leaf lying withered on the ground. Sometimes, but more rarely, the disease extends to the crown or rootstock of the plant, and the plant rots as a blackened, putrid mass. Some affected plants were taken up and washed clean, the affected parts being carefully cut away. When the plants were replanted in fresh soil they recovered, after a top-dressing of potash and carbon in the simple shape of wood-ashes from a rubbish-fire. I have a notion, but no proof, that the attack is brought about by the too liberal use of crude farmyard manure." I was at first unfortunately supplied with too much of the deliquescent material, too much dirt, and too much of the "blackened, putrid mass," and too little of the less affected material. By request, and after I had detected abundant resting-spores of a *Peronospora* in the deliquescent petioles and leaves, better material was supplied. It is, perhaps, needless to say that the blackness and putrescence is an after result of the disease—a late symptom after the marauder itself has vanished. With this knowledge I secured examples only slightly affected, and placed them in a warm shady place in my garden, with the result that the whole material became speedily covered with a white and at length grey mould, which burst through the stomata and spread over the leaves. The growth was only slight on the petioles, and on the upper surfaces of the leaves. The grey mould was most profuse on the back of the leaves, and gave the entire under surface an appearance comparable with dirty brown-grey flannel. The growth was rapid; it spread like wild-fire, and in a day or two reduced the whole material to a black putrid mass. On placing some of the grey mould under the microscope it proved to be a very large and handsome much-branched *Peronospora*, with abun-

dant conidia, or spores, of great size, slightly larger even than the large conidia of the Potato fungus itself. The accompanying illustration (fig. 2), enlarged 400 diameters, shows a single branched thread out of the millions of handsome fellows produced by a single diseased plant of Hellebore.

As far as I know, no *Peronospora* has hitherto been recorded upon Hellebores; and Dr. Cooke writes me from Kew to say "We have nothing (*i.e.*,

have contracted this disease. *Peronospora ficaria* grows commonly upon two Buttercups—viz., *Ranunculus ficaria* and *R. repens*, and from these weeds it has, no doubt, spread, with the worst results, to Hellebores.

As the fungus produces resting-spores in the putrescent foliage, which will probably remain alive in the ground for several years, it behoves all gardeners who have their plants attacked by this *Peronospora*

FIG. 2.—*PERONOSPORA* ON HELLEBORES. (SEE P. 16.)

in the way of *Peronospora*) that I find on Hellebore." However, the fact remains that for two seasons, garden Hellebores have been mown down wholesale in the spring by the *Peronospora* before us, whether in sun or shade, or under glass, all appear to perish on facing this foe.

Many botanists would make a new species of this *Peronospora*, but it is better to consider it as a robust and virulent form of *Peronospora ficaria*, Tul. This is Dr. Cooke's view and mine.

It is not difficult to point out how Hellebores

to carefully destroy with fire all affected examples. Specimens have been sent to the British Museum and Royal Gardens, Kew. *Worthington G. Smith, Dunstable.*

**BEST OF ALL AND WILSON JUNIOR BLACK-BERRIES.**—MR. VERTIGAN sends us sprays of these American Brambles laden with flowers, and with abundant promise of fruit. Even apart from their value as fruit producers, these Blackberries are remarkably handsome in bloom, and well suited for the wild garden on that score alone.

## NOTICES OF BOOKS.

### THE NATIVE FLOWERS OF NEW ZEALAND. Illustrated in colours. By Charles Hetley.

Judging from the specimens before us, this should form an excellent series of illustrations of the more showy New Zealand plants. The drawings are true to Nature, and not too highly coloured. They are not intended for botanical purposes, but with a very little more attention to detail they might be made as serviceable to botanists as they are pleasing to the lover of flowers. Messrs. Sampson Low & Co. are the publishers.

### THE BOOK OF BEEKEEPING. By W. B. Webster. (Upcott Gill, 170, Strand.)

Amid the numerous bee-books this may be recommended to beginners for the simplicity and clearness of its teaching. It does not claim to rank as a scientific treatise, but as a handy guide for the beginner it may be strongly recommended.

## HOME CORRESPONDENCE.

**LEAFY CLEMATIS FLOWERS.**—Herewith, I send some *Clematis* blooms, *i.e.*, if they are worthy of the name, and am at a loss to understand why they fail to produce any colour. We have here eight varieties and all partake (more or less) of this character. The soil they are growing in is of a gritty nature, and was taken from the road-side, the position is open, but sheltered from north winds, and the plants are attached to a trellis erected for them. Can the soil be at fault, or some atmospheric condition peculiar to this locality? Double *Narcissus* here come single, and I have noticed the colouring in zonal *Pelargonium* H. Jacoby is not nearly so dark as in the Western counties. *Tom Stone*. [The outer parts of the flower are all more or less replaced by leaves, the pistils and some of the stamens and pistils are normal. Probably the amount of heat was deficient at a particular period and induced leafy, rather than petalline development. Ed.]

**DOUBLE-FLOWED PRIMULAS FROM SEED.**—The red and the white varieties are easily managed. I sowed a packet of seed of each on April 1, 1887, and the plants raised began to flower in October, and lasted in flower until May last. The white-flowered were double in every case and the flowers large. The scarlet is very pretty—quite double, richly coloured, the plants robust, and very abundant bloomers. These *Primulas* I find excellent, both for cutting from and to employ in house decorations. The same kind of treatment as that afforded the single kinds suits them. They can be propagated true from seeds, and also from cuttings placed under a bell-glass. *W. Smythe, The Gardens, Basing Park, Alton.*

**ROSES FOR THE SAND HILLS.**—Amongst the plants to plant on sandy downs there is none more promising than *Rosa rugosa*. It is its natural station, for I once saw it covering the sandy beaches of Northern Japan, near Awamori, Nippon. I am going to have the experiment made next winter in the downs near Kurnes, with a large batch of seedlings I raised for the purpose. *J. van V., Brussels.*

**THE GARDENERS' ORPHAN FUND.**—As the bulk of the voting papers for the ensuing election are doubtless now filled up, will you permit me to remark upon the fact that although there are ten candidates for the six vacancies on the Fund, only two of that number, so far as I am aware, have issued special appeals to the subscribers or have in such way canvassed for votes. That so far is satisfactory and right, and will encourage the committee to frame a rule which should render canvassing in any form a disqualification. The particulars issued to the subscribers by the committee of the respective position of the various candidates, seem to be fair, and so far as I can see the friendly appeals issued add nothing, whilst in one case matter of grave importance, which shows the receipt of an income by the mother from other sources, is withheld. Private appeals, therefore, do not seem always to favour the claims of the most necessitous. However,

I shall look with interest for the result of the voting, and hope that by ignoring canvassing subscribers will help in the case of this Fund to give a costly and very undesirable proceeding its deathblow. A. D.

**VERONICA FORMOSA.**—In reference to the plant mentioned by "R. D." in last week's issue, I have been wondering whether it is in any way identical with the one called V. Blue Gem, sent out by Messrs. Cripps & Son about the year 1870, and which seems to correspond with "R. D.'s" description of V. formosum. It was raised by me about 1868, and sold to Messrs. Cripps & Son, of Tunbridge Wells. I have had V. Blue Gem in flower when only 3 inches high, and I can send "R. D." small plants or cuttings if he will send me full address. *Head Gardener, The Hollins, Marple, Cheshire.*

**TRANSPLANTING A PEACH TREE IN JUNE.**—On June 25 last I saw a young flourishing Peach tree in one of the Peach-houses at Knightshaws Court, Tiverton, the seat of Sir J. H. H. Amory, Bart., which Mr. James Peebles, the gardener, transplanted from the open wall the previous week, he having rooted out a weakly tree which it was thought at the regular time of planting fruit trees might "come round." There was nothing in the appearance of this healthy young tree of Noblesse to show that it had been recently transplanted. Let it be distinctly understood that I do not recommend the planting of fruit trees when in full leaf, but simply mention it to show that it may safely be done if care be exercised. I need hardly say that the tree bore no fruit. H. W. Ward.

**HEUCHERA SANGUINEA.**—I lately saw a nice plant in flower in Mr. Burroughs's garden, Ketton Cottage, and was favourably impressed with its beauty. It was certainly one of the best things in a choice collection of hardy plants. It appears to be quite as hardy as H. Richardsoni, having well stood the late severe winter, the same plant having flowered last year out-of-doors. W. H. Divers.

**WHITE AND DOUBLE STOCKS.**—I think the following is a curious instance of bee-fertilisation. For three years I had in my garden six dark red Brompton Stocks, flowering well. This year on each plant a part of the blossoms has opened pure white and double; so on each Stock part of the flowers are red and single, and half white and double. The plants have never been disturbed from this border where they are now growing. The plants were brought with me from Wiltshire, where, for many years, they bloomed red. I can only attribute the white blooms to the action of bees. J. Scaden, Gardener, The Roost, Bournemouth. [Our correspondent does not give any reasons for his suggestion. Ed.]

**STRAWBERRY PLANTS FOR FORCING.**—As soon as the last lot of fruiting plants has been transferred to their fruiting quarters it is time to commence preparing for next season. Our plan of securing a strong healthy stock is layering first in 60-size pots, and subsequently repotting, while some gardeners use for layering the runners squares of turf, preferring it to pots. Our soil is a moderately heavy loam which we enriched with a little half-decayed cow-dung or horse-droppings. About the beginning of July we usually commence layering, and in order to obtain a stout single well-matured crown we must from the very first give them every attention, and in no wise allow them to receive a check. In the first place we make all the pots clean, fill them very firmly with a good compost to within half an inch of the pot-rim, allowing plentiful supplies of water. The pots are placed evenly around the plant, and the runners slightly inserted in the soil and tightly secured with a hooked peg. In about three weeks the young plants will have become sufficiently rooted to be taken from their parents, and may be removed to the north side of a wall. During hot weather we syringe several times daily. Potting into their fruiting pots is the next consideration, and is immediately commenced. The most serviceable size is 32s. In potting the plants we always use clean dry and well-drained pots. Over the drainage is placed a few knobs of loam, with an additional handful of soil. The young plants after receiving a thorough dressing with water are turned out of the small pots, and before placing them into the fruiting ones have their roots carefully loosened if they have become somewhat bound. We pot very firmly. They are again stood behind a north wall and syringed for a few days till they have sufficiently recovered to withstand the rays of the sun, when they are removed to

an open position, where they can enjoy the full amount of sunshine, and have a free circulation of air passing among them. During their growing season I make it a rule to have the plants gone over twice weekly, removing all weeds, runners, and side shoots which may appear, leaving only the one crown. The varieties with which we succeed best for principal supplies are Sir C. Napier and La Grosse Sucrée. Viscountess also does well here, but it is not so large as the La Grosse Sucrée. H. Markham, Mereworth Castle.

**CUP-SHAPED FOXGLOVES.**—The flower enclosed is a synanthic proliferous Digitalis—or rather too such—I have just received from the Rev. T. A. Preston, of Thurcaston, Leicester. Though good specimens, they present few, if any, novel features. The ovary in the smaller specimen is largely filled with stamens, and there is evidence of axial proliferation extending to several internodes. I do not remember to have previously noticed the occurrence of coloured spots on the anthers like those on the corolla. The large specimen shows the common leafy central axis, and in both bracts and sepals are practically indistinguishable. G. S. Boulger. [Similar changes are unusually common this season. Ed.]

**OUTDOOR STRAWBERRIES BARREN.**—There are many complaints about here of Strawberry plants being blind, which I have no doubt is chiefly owing to the exceptionally dry weather last year, when as the plants did not make their growth till late in the season the crowns did not get ripened. A border of Laxton's King of Earlies at Burghley Gardens has not a plant which has not flowered well, and there is a good crop. It is instructive to learn that these plants were well watered several times during last summer and mulched. Mr. Gilbert requiring that he has a good crop of fruit whilst many growers have partially failed. As an early variety it should be noted that this variety is a long way ahead of all others in this neighbourhood. W. H. Divers.

**REPOTTING LILIES.**—I assure Mr. Jenkins that I am not one of those gardeners who find it "extremely difficult to attempt a departure from the stereotyped laws of plant and fruit culture as practised years ago." A reference to back numbers of the *Gardeners' Chronicle* will afford him sufficient evidence of this. Indeed, those who have read Mr. Jenkins's remarks on this subject could not have failed to notice the unfavourable light in which he viewed cultivators having the temerity to depart from the beaten path. Mr. Jenkins persists in misconstruing my remarks. He well knows that if the soil were loose enough to be shaken off the roots the new soil could and should be worked well among them without there being necessity to shift the plants into larger pots—a proceeding which would then be quite undesirable and bad in practice. It was quite unnecessary for me to recommend, at p. 558, the shifting of pot-bound plants into larger pots, knowing that it was the only course to be followed, my object being (as stated at p. 754) to point out to those readers of the *Gardeners' Chronicle* who were not quite so well up in Lily culture as your correspondent evidently is, and who had not then attended to the matter, that they might with advantage report their Lilies in the manner indicated in my note on the subject. Mr. Jenkins is altogether wrong in saying that my statement at p. 754 in any way goes to support the conclusions he had previously arrived at. It was simply to show that Mr. Jenkins had over-stated his case, in saying that "it would be difficult to select a more critical time in the whole year for repotting Lilies, than when they had made a few inches of growth," that I suggested for his benefit the time when the "flower-buds were first visible" as a more critical time. Your correspondent is again wrong in suggesting that I am content to forego any cultural detail which experience has taught me to be beneficial to plants, fruit trees, &c. The advantage which your correspondent claims for his method of procedure over that which he takes so much pains to condemn is more imaginary than real. I allow the "new stem-roots" to push into the new soil, and in due time give a surface-dressing of Beeson's manure once or twice a week before giving water at the roots. This being the case, I do not see the justice of Mr. Jenkins's remarks that I am content for the "new stem-roots to feed on the exhausted soil." How can the new stem-roots "feed" on the "exhausted soil"? If your correspondent will show me logically that I do not give my plants "proper food at the right moment" I will

thank him for so doing. I may, however, remind him that all "good cultivators" shade plants—including Melons, Cucumbers, Pines, and young Vines—from sunshine, more or less according to the weather, immediately after repotting or planting, for the obvious reason of preventing the plants from experiencing the slight check which they otherwise would undoubtedly receive. And because judicious treatment has been accorded, are we to arrive at the illogical conclusion that they have been "unnecessarily disturbed at the roots, hence checked, and so forth"? I may here remind Mr. Jenkins that equally satisfactory results are achieved by different modes of culture. H. W. Ward. [Enough has now been said on this head. Ed.]

## SOCIETIES.

### ROYAL HORTICULTURAL.

#### Scientific Committee.

JUNE 26.—R. McLachlan, Esq., F.R.S., in the chair. Present: Messrs. Boulger, O'Brien, Church, Murray, D. Morris, Dr. Masters, and Mr. Ridley.

Mr. Ridley reported that the Odontoglossum referred to him for a name at the previous meeting was a form of *O. oblongatum*.

**Aluminium in the Ashes of Plants.**—Professor Church contributed a summary of his highly interesting and important researches upon the presence of aluminium in the ashes of plants. This substance, instead of being peculiar to the species of *Lycopodium*, as once supposed, is found in minute traces in the ashes of very many others, a circumstance not to be wondered at, considering the abundant distribution of the element in many soils. It occurs in all the species of *Lycopodium* examined, except those which are of epiphytic habit, and which, consequently, do not directly derive their food from the soil. It does not occur in the allied genus *Selaginella*. It occurs in the ashes of some Tree Ferns in large proportions, sometimes forming as much as 20 per cent. of the ash, as in *Alsophila australis* and *Cyathea medullaris*; while from others it is all but absent. In the British species of Ferns little or no alumina has been found.

**Weevil Attacking Rhododendrons.**—Mr. McLachlan exhibited specimens of a beetle destructive to *Rhododendrons* at Sunningdale, and which he identified as *Strophismus limbatus*.

**Beetle Injurious to Tobacco.**—Mr. McLachlan showed specimens sent from Trinidad of beetles injurious to Tobacco and Egg plants at that island, and which he found to be a species of *Epirix*, allied to that which feeds on *Atropa belladonna* in this country.

**The Plague of Caterpillars.**—Mr. McLachlan called attention to the notion that cold winters are injurious to insects—a notion he stated to be erroneous although, no doubt, severe alternations of cold, heat, drought, or moisture, were prejudicial to insect life. During the present season it was noticed generally that great destruction of foliage occurred from caterpillars which destroyed the succulent portions of the leaf and tied the frame-work and fragments together by a web of fine threads comparable with spiders' webs. These caterpillars were different in different cases. In the Oak they were species of *Tortrix*; in the Apple the winter moth was destructive; while in other cases the larva of the Ermine moth was exceedingly hurtful to leaves.

**Heterocercus Fungi.**—Mr. Plowright contributed specimens illustrative of the following notes:—

**Ædium on Pea and on the Bean.**—This was produced on both plants by infecting them with the same infecting material, viz., *Uromyces fabae*. The *Ædium* on the Pea differs in appearance from that on the Bean, the pseudoperidia in the former being few, and scattered over pale yellowish spots, while on the Bean they are crowded in thickened white spots.

**Puccinia extensicola.**—This produces a very handsome *Ædium* on *Aster tripolium*. Mr. Plowright found the Puccinia last year at Wells-next-the-Sea, Norfolk, and produced the *Ædium* this year on the leaf now exhibited.

**Gymnosporangium confusum** (Plowright).—This species has hitherto been confounded with *G. fuscum*. It occurs on Savins, but does not produce *Ædium* on the Pear as *G. fuscum* does, but on the Hawthorn, Quince, and Medlar, specimens of which were exhibited. Professor Soraue of Proskau had sent leaves of Hawthorn on which he had produced the acidiospores of *G. confusum* from teleutospores sent

by Mr. Plowright about a month ago. The acidospores of *G. clavariforme* were also sent for comparison. All the specimens sent were the products of cultivation. A special vote of thanks was proposed by Mr. Murray for this and other contributions of Mr. Plowright.

*Spiral Twisting in Mint*.—Dr. Hogg exhibited a specimen of Mint in which the stem was so twisted that all the leaves were placed in one continuous line. The phyllotaxis, as pointed out by Mr. Henslow, is really not interfered with in these cases. The occurrence is not uncommon. [See Masters' *Vegetable Teratology*, German edition, 1886, p. 307.]

*Opuntia Shoats*.—Mr. Morris exhibited joints of *Opuntia monacantha* and *O. Dillenii*, which bore seeds in their interior, shoots from their upper edge, and roots from their lower end. [Analogous cases were observed as long ago as 1832, and various references to similar phenomena are given in Masters' *Vegetable Teratology*, German edition, 1886, p. 207.]

*Various Exhibits*.—From the Royal Botanic Garden, Edinburgh, came catkins and cones of *Pinus contorta* and other species of *Coniferae*. A malformed flower of *Odontoglossum crispum* from Mr. Douglas, was referred to Mr. Ridley. *Brassica caudata* and *Acanthophippium striatum* were also shown.

## ROSE EXHIBITION AT THE DEVON ROSERIES, TORQUAY.

JUNE 27.—In consequence of the abandonment of the Torquay Horticultural Society's annual Rose exhibition, Messrs. Curtis, Sandford & Co. arranged for a Rose show on their own premises. The object in view, as previously stated in these columns, was to form the nucleus of a fund to help distressed gardeners, their widows and orphans, and to assist invalid gardeners to come for needed rest and change from the North to Torquay. Admission to the exhibition was free to all, collecting boxes being placed among the exhibits. The only drawback was the very inclement weather during the early part of the exhibition, but notwithstanding this the result more than equalled the expectations of the firm, more than £50 nett being taken, and which was placed to the credit of the fund.

The exhibits were arranged in a tent more than 100 feet long, erected over one of the long broad walks in the nursery, so that the exhibits were placed on stands erected over the borders on each side. The entries numbered twenty-eight, some hailing from Oxford and Bath. The prizes were given by Messrs. Curtis, Sandford & Co., and were awarded as follows:—

Class 1: 1st, Silver Cup; 2nd, 1st £1; 3rd, 10s. 6d., for the best amateur's box of twenty-four cut Rose blooms, distinct, single trusses, with foliage.—There were five competitors. Mr. Guerdon, gr. to Miss Watson Taylor, Headingly, Oxford, was placed 1st, with a splendid lot of blooms, principally Teas, nearly all first-class blooms, including *Niphedtos*, Jean Ducker, Souvenir d'Une Ami, Camille Koch, La France, Mâchâle Niel, Dupuy Jamin, Lady M. Fitzwilliam, Belle Fleur d'Anjou, Madame Welche, Catharine Mermet, Rubens, Perle des Jardins, Devoniensis, Souvenir d'Elise Vardon, Madame Watteville, Comtesse de Nadailac, Madame Willermoz.

Class 2: For twelve cut blooms of Roses, single trusses, distinct, with foliage, open to amateurs in Torquay and neighbourhood. 1st prize, 1st £1; 2nd, 10s. 6d.; 3rd, 5s. Seven competitors.—Major Roderaz, Vale Lodge, Torquay, secured 1st, with a very nice box of blooms of good substance, the best varieties being Rubens, Duke of Wellington, Madame Gabrielle Luizet, La France, and Innocente Pirola.

Class 3: Open to local amateurs; six cut blooms of Roses, all of one distinct colour. 1st prize, 10s. 6d.; 2nd, 7s. 6d.; 3rd, 5s. Nine competitors.—1st, Mr. Warren, gr. to the Dowager Lady Haldon, with very nice blooms of *Devoniensis*.

Messrs. Curtis, Sandford & Co. themselves put up twenty-eight boxes of cut blooms of Roses of their usual merit; very fine boxes each of Lady Mary Fitzwilliam, Merville de Lyon, Ulrich Brunner, La France, and Marie van Houtte, were splendid. Among their boxes of Tea Roses as being especially good were Madame Cusin, Innocente Pirola, Rubens, David Pradel, Mâchâle Niel, Anna Ollivier, Comtesse Riza du Parc, J. Pernet, Viscountess Folkestone, &c. Among H.P.'s, which were excellent, the following varieties were particularly good—Violet Bowyer, Etienne Levet, La France, Baroness Rothschild, Madame G. Luizet, Anne Laxton, Senateur Vaisse, Souvenir de Paul Neron, Francois Michelon, &c.

A box of *Dahlia* blooms was shown by Mr. Hammet,

florist, Brixham. Mr. G. H. Pearce, Higher Union Street, Torquay, staged baskets of excellent fruit each of Sir Joseph and Dr. Hogg Strawberries, and a very fine dish of Tomatoes. Messrs. Lucombe Pince & Co. staged several nice boxes of Roses, one large box of *Niphedtos* being remarkably good. Their principal H.P.'s were Etienne Levet, Madame G. Luizet, Baroness Rothschild, C. Bowyer, A. Souper, Charles Lefebvre, Ulrich Brunner, and John Hopper. Mr. Walker sent up a basket of choice hybrids of *Aquilegia*. A large quantity of baskets of Roses (cut blooms) were also put up. The success of this, the first attempt of the firm, has decided them to hold a two days' exhibition next year. D. C. P.

## RICHMOND HORTICULTURAL.

JULY 4.—Held in the customary locality the Old Deer Park, the show suffered appreciably from lack of help on the part of plantmen, as the large tent which used to look so brilliant with fine plants and groups was but poorly filled. Cut flowers were, however, plentiful, fruit fair, and vegetables not only abundant but good. These facts indicate what is found generally—that plants as an exhibition element are much less favoured than formerly.

Honorary contributions formed, as usual, a marked feature. These included a charming group of pot Roses faced by a line of the variegated *Eurya latifolia*, and backed by Japanese Acers and standard plants, ranging from 6 to 8 feet in height, of *Hydrangea paniculata*, each carrying fine panicles of flowers, some fully 10 inches long. This group came from Messrs. James Veitch & Sons. Messrs. C. Lee & Sons had one of their well-known and most interesting groups of hardy trees and shrubs, the foliage variegated and coloured in rich variety, helped by some pot Roses and hardy Ferns. Messrs. J. Laing & Son had a pretty group of Begonias, interspersed with some good Gloxinias and foliage plants. From Messrs. B. S. Williams & Co. came a pretty group of Orchids and other choice plants, including some of the scarlet *Bottle-brush*, *Metrosideros floribunda*. Mr. E. Drost, Kew Road, had a big group of Palms, some colour being added by the novel method of tying bunches of Irises, &c., on sticks and standing them amongst the foliage. Mr. Chambers, Isleworth, had his beautiful pure white *Viola Snowflake* in quantity; Mr. T. S. Ware and Messrs. Barr & Son, large and beautiful collections of hardy flowers, which made a striking feature; and Messrs. Veitch & Sons had, in addition, a capital lot of cut Roses, including most of the best varieties.

Groups.—Only two were in competition for the large groups. Mr. A. Brown, of Richmond coming 1st with a very taking arrangement, but some of his tall plants, especially *Tuberose* and *Lilliums*, had a "sticky" look; Mr. James, of Norwood, was 2nd, with thin group, chiefly of Orchids.

Stove and Greenhouse Plants.—Mr. W. Bates, Poulett Lodge Gardens, Twickenham, was 1st in two classes for these plants, having good *Allamanda Hendersoni*, *Bougainvillea glabra*, *Sobralia macrantha*, *Gloriosa superba*, &c. In one class Mr. James was 2nd, whilst in the other Mr. Munro, gr. to E. D. Paul, Esq., Twickenham, was 2nd. He also had *Gloriosa superba* and *Kalosanthes coccinea*, very fine.

Foliage plants were not first-rate, the first coming from Mr. Chadwick, gr. to E. M. Nelson, Esq., Ealing, who had a big *Cycas revoluta*, huge *Arecia lutescens*, good *Crotons*, *Asparagus plumosus nanus*, and *Alcacia variegata*. Mr. James took 2nd place, having an immense *Lataia borbonica*, which overshadowed all else.

Exotic Ferns came from Mr. Munro and Mr. Chadwick, and generally comprised good fair-sized specimens of *Davallia*, *Adiantums*, &c., the prizes going in the order given.

Palms were a strong but very sombre feature, and made a heavy dull group. The best six came from Dr. Wood, Roehampton, Mr. Bates, and Mr. James following.

Coleus, though smaller, were more attractive, because well coloured. These were chiefly flatish in form, and came from Mr. Coombs, gr. to W. Furze, Esq., Teddington, admirably done. Mr. Sullivan, gr. to D. B. Chapman, Esq., Roehampton, and Mr. East, gr. to F. Wigan, Esq., East Sheen.

Orchids were very good, the best six being sent by Mr. Hill, gr. to H. Little, Esq., St. Margarets, who had the deliciously perfumed *Aerides Leonii*, with six spikes, *A. odoratum purpurascens*, *Cattleya Sanderiana*, and *C. intricata* as named by Reichenbach; and *Cypripedium barbatum superbum* and *C.*

*Veitchii*. Mr. H. James was 2nd, with good pieces of *Cattleya Mendelii*, *Aerides Loblii*, *Cypripedium barbatum*, *C. nigrum*, &c.

Show and Fancy *Pelargoniums*.—Specimen plants came from Mr. C. Turner only, medium-sized, well-flowered, and very attractive. Two collections of small plants in groups were staged, the best coming from Mr. W. Clay, Kingston. Zonal *Pelargoniums* were very showy, Mr. Hill having the best six in four singles and two doubles; whilst Mr. Barnes, gr. to W. S. Graham, Esq., Roehampton, had chiefly doubles, profusely bloomed. *Fuchsias*, were poor; *Begonias* very good, Mr. Hill having the best six plants, finely done and flowered; and *Gloxinias* were also very good.

Cut Flowers, Table Decorations &c., filled a large tent and made a brave show. The open classes for thirty-six and twenty-four Roses in trebles brought beautiful flowers from Mr. C. Turner, 1st in both classes; Messrs. Paul & Sons, Old Nurseries, Chesshurst, 2nd in both; and Mr. W. Rumsey, Waltham Cross, 3rd. Mr. Turner's flowers were specially fresh and clean; but with the National Show at hand, we need hardly recapitulate kinds. In the class for twenty-four singles (amateurs), Mr. West, of Reigate, was 1st, and Mr. Warwick, Hampton, 2nd, whilst the latter had the best twelve flowers, and Mr. Girdlestone, of Sunningdale, the best twelve Tea Roses. Mr. Bates had the best twelve bunches of cut flowers. A number of pretty table stands and baskets of flowers were staged, all very pleasing. Buttonhole bouquets and sprays were capital, but hand bouquets poor.

Fruit was fairly abundant, but had suffered from lack of sunshine. Mr. Osman, gr. to L. H. Baker, Esq., Ottershaw Park, was 1st, with six dishes, having fair white and black Grapes, Peaches, &c. Mr. Palmer, gr. to F. Ham, Esq., Thames Ditton, was 2nd. Mr. Bates had the best four dishes. In the open class for Grapes the best pair of bunches of black were staged by Mr. Osman, who had good Hamburgs; Mr. Thompson, gr. to Messrs. W. & E. Wells, Hounslow, coming next with grand Madresfield Court, only wanting deeper colour. Mr. Feist, gr. to W. Ashton, Esq., Englefield Green, had of white five bunches of Muscat of Alexandria, but wanting finish; Mr. Thompson being again 2nd, with the same Grape, finely berried. In the local classes Mr. Bates had the best black in good Alicante, and Mr. Munro the best white, in Buckland Sweetwater. The best green-flesh Melon was William Tillery, from Dr. Woods; and the best scarlet-flesh was Scarlet Reimer, from Mr. East.

Vegetables were a remarkable feature. Mr. Waite, gr. to Colonel Talbot, Esher, taking 1st place in both the chief classes with wonderfully fine clean samples, Mr. Palmer being 2nd also in both classes with capital exhibits. Cucumbers were good and numerous, and Tomatoes in pots were fairly well done. Nearly a score of large baskets of vegetables were also staged, this department being unduly crowded with exhibits.

## THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The forty-fifth anniversary festival of this Institution was held at The Albion, Aldersgate Street, E.C., on Wednesday evening, when a large company assembled. In the absence, through illness, of Mr. Joseph Chamberlain, M.P., Sir Trevor Lawrence, Bart., M.P., President of the Royal Horticultural Society, presided. Horticulturists of all sections were well represented, and many friends of the art and of the Institution were present.

The Chairman on rising to propose the toast of the evening, "Success and Prosperity to the Gardeners' Royal Benevolent Institution," was received with loud cheers. He observed that it would be unnecessary for him to say what a keen sense of disappointment he felt when he heard that the Right Hon. Joseph Chamberlain had been prevented by illness from being in the chair that evening. He had in his hand a letter from Mr. Chamberlain, in which the writer expressed his great disappointment at being unable to be present that evening through illness, but he also had a subsequent telegram saying that he (Mr. Chamberlain) would be happy to come on some other occasion. The objects of the Institution were well known to every one as well as its claims. But on looking through the list of subscribers he was sorry to say he found absent the names of a large number of friends of his own who derived a large amount of pleasure from their garden, and he felt sure it had not been brought to their notice that they ought to subscribe

to the Institution. The Institution did not do anything which was at all extravagant. It simply gave to the men who were pensioners £20 a year and to the women £16. Surely it would be impossible to do less than that. It had got on its lists a very considerable number of gardeners, and he was glad to see that it was enabled to add to the comforts of the old age of a considerable number of them. The average age of pensioners, he found, was seventy-four, and the oldest pensioner was a hundred years of age. Therefore gardening did not appear to be an unhealthy occupation. The number of applications was larger than the charity was able to help. The total expenditure was only £2250, and when he recollected the enormous interest which the people of this country took in gardening, he must say it was a reflection upon the wealthier people of the country that they did not support the Institution more largely. The Institution had made it a rule to help those first who helped themselves, and that preference was given to those who had been on the books of the Society for fifteen clear years before any help was given to others. He ventured to think that they ought to work the field of gardening and the interest the people look in their gardens more largely than was done in the interest of the Society. Gardeners often found themselves in the position of having very little for their declining years, and he could not believe that the people who got enjoyment out of their gardens would not be prepared to provide for the maintenance of that admirable institution. He coupled with the toast the names of Mr. Lee, the father of the Institute, who had missed only one dinner out of forty-five, and Mr. H. J. Veitch, the Treasurer.

Mr. John Lee in response thanked the company for the enthusiastic manner in which they had received his name, and went on to say that he owed a great debt of gratitude to the Chairman for having, at a moment's notice, consented to preside that evening, and to those gentlemen present for the generous support they had given to the Institution, as it was, through their generosity that it had been raised to a high pitch of excellence, and had been placed on a solid ground which he, and he knew they all, hoped it would maintain for many years to come.

Mr. H. J. Veitch also responded, and having returned thanks for the hearty reception accorded him alluded, as Treasurer, to the financial position of the Institution, which he said was managed as carefully as it was possible to manage any institution. He would again like to remind them that the interest on the money subscribed all went in benefiting their pensioners. They had no large buildings to keep up and no expensive staff to maintain, but they were obliged to have a Secretary, whom they paid as little as possible! With that one exception the whole of their money was devoted to the purpose for which it was given. They had 126 pensioners, but at present they had only one election a year, and at the last election they were obliged to leave out fifteen unfortunate candidates for want of funds. That was a sad thing for either men or women, but one case was particularly sad, as in that instance the applicant lost by only nine votes, after having secured 700. Another election would not take place for a year, and who could tell how many more candidates there might be then? The present bad times affected gardeners even more than most other servants, as they were the first to be discharged in times of scarcity. He knew of cases where gardeners had been out of employment for three and four years, and they were compelled to spend what little savings they had put by for old age. This Society tried to meet those cases, and he was bound to say they made the funds at their disposal go as far as they possibly could. Unfortunately for the Society they had lost fifty guineas a year by the conversion of the Three per Cent. Consols. In conclusion, he said, if they could only see the tears of joy in the eyes of the recipients they would not fail to continue their liberal support to the Institution, and they might rest assured that the money they gave was well deserved.

Dr. Masters proposed the "Health of the Chairman."

The Chairman in acknowledging the toast, which was enthusiastically honoured, said, in allusion to a remark of Dr. Masters, he agreed that the Royal Horticultural Society ought to interest itself in all that concerned gardeners and gardening; he thought the Society had done something to show that it was ready to open its doors to all who desired to enter.

The Secretary then announced that the night's subscriptions amounted to nearly 1000 guineas.

The Chairman proposed the "Health of their old friend, Mr. Cutler." That gentleman having responded,

Mr. B. S. Williams responded to the toast of "The Committee;" and the proceedings, which had been enlivened with music, then terminated.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending July 2, is furnished from the Meteorological Office:—

"The weather has been very unsettled and rainy except in the extreme north of Scotland. Sharp thunderstorms have prevailed in almost all districts, and in some localities the rainfall was exceedingly large. At Rothamsted, on the 26th, 3.24 inches of rain fell between 7.30 p.m. and 11.30 p.m.

"The temperature has just equalled the mean in 'Scotland, W.,' but has been below it in all other districts; in 'England, E.,' the deficit was 4°, and in 'England, N.E.,' 5°. The highest of the maxima were recorded generally on the 26th, when the thermometer rose to between 80° and 85° in most parts of the kingdom, but over the south and south-west of England and the south of Ireland it ranged from 71° to 76°. The lowest of the minima (which were registered during the last few days of the period) were unusually low for the time of year; at most of the inland stations the sheltered thermometer fell to between 34° and 39°.

"The rainfall has been considerably less than the

mean in 'Scotland, N.,' but more in all other districts, the excess in most cases being very large; in 'Ireland, N.,' and 'Scotland, W.,' it exceeded an inch and a half.

"Bright sunshine has been very little prevalent, the percentage of the possible amount of duration ranging from 17 to 29 over England, from 23 to 26 in Ireland, and from 32 to 38 in Scotland."

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

**EDIBLE PINE**.—In *The Long White Mountain (Manchuria)*, by H. E. M. James (Longmans, 1888), at p. 943, I find the following:—"On the third day, on the road from Sansing to Ninguta, we reached a forest of Birch, Spruce, and Pines. Amongst the latter was the edible Pine, bearing cones 6 inches in length, with seeds the size of Almonds, packed tightly in rows at the base of each layer of leaves. When the skin outside is cracked and stripped off, the kernel is good to eat, though, perhaps, a little tasteless. I counted 146 in one cone." What can this be? It is much too large for *Pinus Cembra*. It is the size of the cone of *Pinus pinea* (the Stone Pine of Italy), but the seeds of the latter are also much smaller than these, which seem as large as those of an *Araucaria*, and the locality puts these out of the question. I think there is on the Pacific slope of the United States of America a Pine with eatable seeds, but am not sure of it. In the index of plants collected by the author I find only *Pinus Manchurica* and *P. Koraiensis*. *J. V. V.* [Can it be a Pine at all? Ed.]

## NOTICES TO CORRESPONDENTS.

**AMARYLLIDÆE**, Mr. J. G. BAKER'S BOOK ON: *E. C. P.* We do not know the price. Write to the publishers, Messrs. Bell & Sons, York Street, Covent Garden, W.C.

**BURNT EARTH**. *Burnt Earth*. The best way to obtain this on a small scale is to collect the garden rubbish, wood-trimmings, &c., into a heap, and set fire to it, after first covering it with litter, and then on the outside with loamy, or, indeed, any kind of soil that is handy. If the covering-up is done in the charcoal-burner's manner of covering a heap of wood to be converted into charcoal, and by so regulating the vents that the materials are not permitted to flare, the rubbish will be charred into a useful material for mixing with potting soils, and the 6-inch covering of soil, in which ever manner the job may be performed, will be "burnt." On a larger scale, loamy earth may be burnt in the same way that ballast is prepared from clay, i.e., by burning it with a small proportion of small coal in conical heaps.

**CUCUMBER DISEASED**. *W. S.*, *Stony Stratford*. The name of the fungus infesting your Cucumber plants is *Didymium dedaleum*. We believe the fungus to be very rare. For an illustrated account of an allied fungus infesting Hart's-tongue Fern, see *Gardeners' Chronicle*, July 15, 1882. *W. G. S.* [We shall shortly illustrate this species also. Ed.]

**CUTTING BACK A HOLLOW HEDGE**. *E.* Cut it now, and you will get some growth on it by the end of August. The cutting of the other side may be done next spring, just before growth commences. It should be carefully done with the *secateur*, knife, and saw. You do not say of what plants the hedge is composed, so that we are advising without fully knowing your case.

**EUCALYPTUS**. *J. G.* If, as we understand you, the glaucous form is a seedling from the green, then, undoubtedly, the two are but forms of one and the same species, and that *E. urnigera*, as proved by the flowers and seed-vessels you first sent. We should not attach any great importance as a differential character to the glaucousness of the leaves, for that is notoriously variable according to age and other circumstances, which are very interesting.

**GIANT ORACH**. *F. W. H.* A variety of *Atriplex hortensis*, an annual plant of rather large growth, the leaves of which are used as Spinach. It produces best when sown in good ground, which is usually done in March and successively

throughout the summer months. Sow in drills, 2 feet apart, and thin the seedlings to 1 foot apart.

"HORTICULTURAL ADVERTISER." *Poor Geordy*, Messrs. Foster & Pearson, Beeston, Notts.

**INSECTS**. *J. A. C.* The worm was attacked by what, from your description, was evidently the larva of one of the larger beetles (Staphylinidae). *W.* [We shall be enabled shortly to give a figure and description of the insect. Ed.]

**LILIES DISEASED**. *G. L.*, *Hungerford*. The Lilies have been destroyed by the well-known Lily-disease, which has been extremely prevalent this year. It was described in the *Gardeners' Chronicle* for September 10, 1881, under the name of *Ocularia elliptica*. We shall publish a further account of this disease shortly.

**MELONS**. *R. Rigg*. The leaves are affected by a species of fungus similar to that which is ordinarily called Potato disease. There is no known cure. Burn the plants, and burn sulphur in the structure before putting into it any kind of plant. See article on Vine Mildew, p. 15.

**MILDEW ON STRAWBERRIES**. *H. J.* Mildew usually appears on these if the air in the house or pit is close, cool, and moist, these being conditions favourable to its development. It may be checked if taken in time, without much damage being done, by timely application of flowers of sulphur, distributed by a "boite-à-houppes"—that is, a wollen sulphur distributor—or by getting the heating apparatus warmed after smearing it with lime-wash and flowers of sulphur. Take out badly infected plants and burn them. Maintain a healthier condition of the air within the house.

**MUSHROOM**. *R. J. Russell*. A Mushroom measuring 33 inches in circumference, with a stem of 5½ inches, and weight 17 oz., is phenomenal. One of 1 lb. 9 oz., and 36 inches in circumference, was noticed in our pages October 19, 1878, p. 500.

**NAMES OF PLANTS**. *J. F.* *Calycanthus floridus*.—*L. J. W.* *Rhododendron cinnabarinum* (Blandfordia).—*Lily*. *Lilium testaceum*. When you say "imported," we presume you mean from Holland. If not, we should be glad to know whence.—*B. P.* 1, *Hieracium aurantiacum*; 2, *Centranthus ruber*; 3, *Hyacinthus comosus*; 4, *H. plumosus*; 5, next week; 6, *Chrysanthemum Leucanthemum* (Ox-eye Daisy).—*J. H.* 1, *Escallonia Philippiana*; 2, *Diplacis glutinosus*; 3, *Fuchsia procumbens*; 4, *Eupatorium Weinmannianum*.—*B. A. G.* 1, *Nephrodium filix-mas var. fluitans*; 2, *Polystichum angulare var. oxyphyllum*; 3, *Lomaria alpina*; 4, *Nephrodium filix-mas var. cristata*; 5, *Polystichum angulare var. lineare*; 6, *Aspidium acrostichoides*; 7, *Erinus alpinus*; 8, *Cattleya labiata var. Thorne*, *Spiraea cantoniensis*, *Crataegus rotundifolia* (a form of *C. coccinea*).—*C. E. B. Y.* *Sempervivum villosum*.—*P. H.* *Trifolium striatum*.—*J. Morton*. *Calamintha grandiflora*.—*J. B.* *Philodendron longelaminatum*.—*R. C. B.* *Vicia narbonensis var. serratifolia*.—*Beesley*. 1, *Rhus cotinus*; 2, *Pyrus aria*; 3, *Spiraea confusa*; 4, *Deutzia scabra*.—*Martin*. *Laleopsis domingensis*.

**PEACH**. *J. S. B.*, *Chelmsford*. Mildew. See this and our last issue for particulars of remedy.

**PEACH, EARLY RIVERS**. *G. H.* It has the fault of splitting at the stone, even in dry seasons. It is one of the finest of the early varieties, but we do not know of any remedy for the splitting.

**PEACH TREES**. *W. N.* In September, as soon as there is any sign of maturity in the leaves, carefully dig up the roots, after unnauling the shoots and securing them in three or four bundles, with plenty of fresh loam mixed with a little of the staple, plant the roots, carefully stretched out, at 6 inches below the ground level. Mould immediately on planting, and fasten the shoots loosely to the wall.

**POTATOS**. *I. O. G.* The earliest come from Malta, Algiers, and South of France, later ones from Jersey, Cornwall, and the South of England.

**RECORD OF CERTIFICATES**. *J. T. P.* The official list is given to our representative at the close of the meeting by the officers of the Society. At the end of each half year the complete list is sent for revision, when omissions are supplied and errors rectified: hence the discrepancy.

**TEA-SCENTED ROSE**. *H. G. E.* We cannot undertake to name varieties of the Rose. Send it to a Rose nursery.

**THYMUS SERPYLLUM**. *A. B.*, *Cambridge*. The occurrence of two forms, one with hermaphrodite, the other with female flowers, is frequent. They do not constitute separate varieties, but merely sexual forms. You will find a full account, with illustrations, in Müller's *Fertilisation of Flowers*, English edition, by D'Arcy Thompson, 1883, p. 473.

**VINES**. *H. L.* Your leaves and berries are covered with the spores of a fungus (*Pilobolus*) common on dung. The spore-case bursts elastically, and projects the spores on to the leaves, &c. We do not think they will do any serious mischief.

**YORK GALA**. *Subscriber*. No—not in our columns.

**COMMUNICATIONS RECEIVED**.—*W. H. C.*—*D. T. F.*—*J. T. F.*—*T. M. J.*—*S. G.*—*W. W. B.*—*P. M.*—*D.*—*U. D.*—*H. W. R.*—*A. R.*—*F. R.*—*D.*—*E. C.*—*J. Whittaker*.—*W. H.*—*W. W.*—*Cocking* & *Co.*, Yokohama.—*Deane* & *Co.*, Messrs. Carter & *Co.*, R. V. Cooper, Taber & *Co.* (already noticed on these pages).—*C. F. L.*—*F. Coney* (see inflorescence, but on too small a scale to be of use).—*J. R. A.*—*D. J.*—*S. J.*—*H. J.*—*W.*, *Kew*,—*J. V.* & *Sons*.—*J. D.* & *S.*—*J. J.*—*J. H. Krelage*.

## MARKETS.

### COVENT GARDEN, July 5.

Outdoor Strawberries are in full supply and good condition. Business quieter, and clearances made at somewhat lower rates. *James Webber, Wholesale Apple Market.*

\*. Orchid bloom in great variety, but the demand not very good.

**GARDENIAS.**—Never had a finer stock of this beautiful Greenhouse Shrub. Specimen Plants from 3 to 5 feet high by same through, from 25s. to 60s. each. These are grand plants. Half Symples, from 2 to 3 feet high, 1s. to 15s. each. To anyone wishing to stock a greenhouse, or to the Trade, this is a good opportunity to secure fine large plants.—E. COLLINS AND SONS, Cumberland Park Nurseries, Wilkesden Junction, W.

**80,000 CLEMATIS, in Pots, of all the** finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5½-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

**THE TRADE.**  
ANEMONE FANNINI, strong cultivated roots, scarce, 12s. per doz.  
AMARYLLIS VITTATA, red, white centre, fine bulbs, 75s. per 100.

CYRANTHUS MAKENII, a fine novelty, 20s. per 100.  
FREESIA REFRATA ALBA, strong, 60s. per 100.  
HEMANTHUS ALBIFLOUS, flowering roots, 60s. per 100.  
IMANTHOPHYLLUM MINIATUM, flowering roots, 15s. per 100.  
NERINE FLEXUOSA, flowering roots, 20s. per 100.  
SPARAXIS BURLEIGHII, flowering roots, 6s. per 100.  
SCILLA NATALENSIS, very strong bulbs, 40s. per 100.  
TUBEROSAS, double, picked, scarce this season, 40s. per 1000.  
VALLOTTA PURPUREA MINOR, very good, 25s. per 100.  
NATAL EVERLASTING (Eichelyum adenocarpum), pink and red, well dried, 10s. per 1000 flowers.

**Seeds.**  
PHENIX RECLINATA, perfectly fresh and good, 6s. per 1000 seeds.  
DRACENA HOOKERIANA (Mauritiana) UNULATA, very robust species, 2s. 6d. per 100 seeds.  
Deliverable May to September, except Sparaxis and Freesia, which will be ready in December. Free to Durban. Cash on receipt.  
R. W. ADLAM, Town Bush Valley Nursery, Maritzburg, Natal.

**NEW PELARGONIUM, "DUCHESS OF TECK."**

Awarded a First-class Certificate at the Manchester Royal Botanical and Horticultural Society's Summer Exhibition of 1887. It is a white Regal decorative variety, semi-double, immense frusses, the flowers are erect, petals undulated, distinguishing it from the ordinary Pelargoniums. It is novel and conspicuous; has a compact habit, and is one of the best Pelargoniums in cultivation. It is invaluable for cut flowers where white is in demand.

3s. 6d. each, 30s. for 12 plants, 50s. for 25 plants.  
Cut Flowers sent on application. Sent out by FISHER, SON, and SIDRAY, Handsworth Nurseries, Sheffield.

**BEAUTIFUL JAPANESE IRIS.**—The most beautiful of all hardy Irises. Strong flowering plants in pots. Best and most beautiful named varieties. All distinct. 21s. per dozen.

BARR AND SON, King Street, Covent Garden, W.C.

**ROMAN HYACINTHS and other FRENCH** BULBS grown by Louis Bremon et Fils, Orléans.—Trade List on application to WILLIAM DENMAN, 7, Catherine Street, Covent Garden, London, W. C.

**ORCHID PEAT, best quality; BROWN** FIBROUS PEAT for Stove and Greenhouse use. RHODODENDRON and AZALEA PEAT. Samples and Prices to WALKER AND CO., Farnborough, Hants.

## GARDEN REQUISITES.

**COCOA-NUT FIBRE REFUSE.**  
4d. per bushel; 100 for 25s.; truck (loose, about 2 tons), 10s. 4-bushel bags, 4d. each.  
**LIGHT BROWN FIBROUS PEAT, 5s. 6d. per sack; 5 sacks, 25s.; sacks, 4d. each.**  
**BLACK FIBROUS PEAT, 5s. per sack, 5 sacks, 22s.; sacks, 4d. each.**  
**COARSE SILVER SAND, 1s. 9d. per bushel; 15s. per half ton; 26s. per ton, in 2-bushel bags, 4d. each.**  
**YELLOW FIBROUS LOAM, PEAT-MOULD, and LEAF-MOULD, 1s. per bushel.**  
**SPHAGNUM MOSS, 8s. 6d. per sack.**  
**MANURES, GARDEN STICKS, VIRGIN CORK, TOBACCO CLOTH, RUSSIA MATS, &c.** Write for Price LIST.—**H. G. SMYTH, F.R.H.S., 21, Golden Square, Street, Drury Lane (lately called 11A, Court Yard), W.C.**

## GARDEN REQUISITES.

TWO PRIZE MEDALS.

**Quality, THE BEST in the Market.** (All sacks included.)  
**PEAT, best brown fibrous ... 5s. per sack, 5 sacks for 22s. 6d.**  
**PEAT, best black fibrous ... 4s. 6d. ... 5 sacks for 20s.**  
**PEAT, extra selected Orchids ... 1s. 6d. ... 5 sacks for 35s.**  
**LOAM, PREPARED COMPOST, 1s. per bush, 3s. per sack**  
**LEAF, or PEAT MOULD ... (sacks included),**  
**SILVER SAND, coarse, 1s. 6d. per bush, 14s. half-ton, 24s. ton.**  
**RAPPA FIERE, best quality, 1s. 6d. per bush, 15s. 10s. 10s.**  
**TOBACCO CLOTH, or PAPER ... 1s. 1b.; 23 lb., 27s.**  
**SPHAGNUM MOSS, all selected, 3s. per bush, 5s. per sack.**  
**CHUBB'S "PERFECT" FERTILIZER (the Best Food for all kinds of Plants, Flowers, &c.)** (Tins, 7lb. 14lb. 28lb. 56lb. 1 cwt. Fruits, Vegetables, &c. ...) 1/6 3/4 5/- 8/- 14/- 22/-  
**CRUSHED BONES, or Bone only 1/2 2/3 3/6 6/- 12/-**  
**VIRGIN CORK (Best Quality) 1/2 2/3 3/6 6/- 10/6 17/-**  
**RUSSIAN MATS, BAMBOO CANES, PERUVIAN GUANO, NITRATE OF SODA, HORTICULTURAL CHARCOAL, &c.**  
**PEAT MOSS LITTER, cheapest and best Bedding for Horses and Cattle, 2s. per ton. Extra large Sample Bales, 6s. each.**  
**COCOA-NUT FIBRE REFUSE (by Chubb's special process), 15s. 12d. each; 10 sacks, 11s.; 15 sacks, 15s.; 20 sacks, 18s.; 30 sacks, 25s.; 40 sacks, 30s.; Truck-load, loose, free on rail, 25s. Limited quantities of G., special quality granulated, in sacks only, 2s. each. Terms, strictly Cash with order.** (Bankers, Union Bank of London.)

**CHUBB, ROUND & CO.,** WEST FERRY ROAD, MILWALL, LONDON, E.

**NATIVE GUANO.**—Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.  
A 1 cwt. sample bag sent, carriage paid, to any Station in England on receipt of post-office order for 6s.

Extracts from Twelfth Annual Collection of Reports:—**NATIVE GUANO for POTATOES, VEGETABLES, VINES, and FRUIT.**—G. COLEMAN, Walton-on-Thames.—"Used for Potatoes. Result: very excellent crop; remarkable size and good quality. Can highly recommend it."

D. WILLIAMS, Head Gardener to the Rt. Hon. Lord Wimborne, Canford Gardens, Wimborne.—"Used for Vines, Peaches, Strawberries, flowering plants, kitchen garden crops, with very good results. First class manure for pot Strawberries."

**NATIVE GUANO for ROSES, &c.**—T. ST. CLAIR, Rose grower by appt. to H.R.H. the Princess of Wales, Strawberry Hill.—"Used for standard and dwarf Roses. Result: excellent growth, fine bloom, and perfectly free from blight the whole season."

A. F. BARRON, Royal Horticultural Soc., Chiswick.—"Without doubt a very valuable manure, and easy of application." Orders to the NATIVE GUANO CO. (Limited), 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials may be obtained. Agents Wanted.

## CARSON'S PAINT

Patronised by 16,000 of the Nobility, Gentry, and Clergy, for all kinds of **OUTDOOR WORK, CONSERVATORIES, Greenhouses, Frames, &c.**

1 Cwt., and Oil Mixture, Free to all Stations. Liquid Non-Poisonous Paints for Inside of Conservatories, &c. Prices, Patterns, and Testimonials, Post-free.

**LA BELLE SAUVAGE YARD, LUDGATE HILL, E.C.** BACHELOR'S WALK, DUBLIN.—Discount for Cash.

# STANDEN'S MANURE.

Established over 30 years.

**THIS OLD-ESTABLISHED MANURE** is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

## TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted."—C. M. HOVER, Boston, U.S.A., May 27, 1887.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

## THE "NEW EASY" LAWN MOWER.

Has an Open Steel Roller.

A man can work a 24-inch machine, cutting Grass 5 inches high clean to roots.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

The Front Roller, with simple adjustment, enables the machine to cut very close to the ground, and to do fine work.

The machine will also cut verges.

Tobacco obtained through all the leading Ironmongers or Seedsmen, or from the Soli-Executors.

CUTS 24-INCH GRASS.

**TO SEEDSMEN**.—Wanted by a respectable young man a situation in a Seed House, &c. Thorough experience from a first-class house. Eight years' good reference from last situation.—W. H., Lower Farm, Kensal Green, W.

**HOLLOWAY'S PILLS**.—Wrong made right. —Every day that any bodily suffering is permitted to continue renders it more certain to become chronic or dangerous. Holloway's purifying, cooling, and strengthening Pills are well adapted for any irregularity of the human body, and should be taken when the stomach is disordered and liver deranged, the kidneys inactive, the bowels torpid, or the brain muddled. With this medicine every invalid can cure himself, and those who are weak and infirm through imperfect digestion may make themselves strong and stout by Holloway's excellent Pills. A few doses of them usually mitigate the most painful symptoms caused by undigested food, from which they thoroughly free the alimentary canal and completely restore its natural power and action.

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS, RAISING WATER

Street, Strand, W.C.

**TO BE SOLD (a rare opportunity), a**  
Valuable and most Eligible FREEHOLD and FLOREST'S  
NURSERY. The property is pleasantly situated on a main  
road about 2 miles out of Leicester—which is one of the most  
thriving manufacturing towns in the Midlands—in a good  
locality. It consists of three (red brick and slated) well-built  
half-windowed Villa Residences, containing eight rooms and  
two cellars each, with Gas and Water, at the rear of which  
are seven large Glasshouses (numerous Pits and Out-houses)  
heated by hot-water. Superficial Area of Glass, over 4000 feet.  
All in good state of repair. Also a large Garden, with river  
frontage, well stocked with Fruit Trees in full profit. The  
whole standing on about 2000 square yards of Land, and  
bringing in a rental of £28 per annum. Stock low.

For further particulars apply to the Premises to the owner,  
Mr. S. WALKER, Aylestone Park, Leicester; or HARRISON  
AND SONS, Market Place, Leicester.

**To Florists, Seedsmen, &c.**  
**TO BE DISPOSED OF**, the going concern of  
a well-established BUSINESS, capable of extensive  
improvement under good management. First-class neighbour-  
hood and thoroughgoing business.  
Apply to NORRIS and CO., Estate Agents, Watford.

**FOR SALE or LEASE**, a handsome detached  
old-fashioned truly country HOUSE, 2 floors, 2 acres  
Ground. Mile station, 13 London.—Dr. GILL, Whitton, S.W.

**TO BE SOLD, THE LEASE of a Country**  
NURSERY with useful stock at a valuation, or would  
take a Partner.  
J. D. GARDENERS' Chronicle Office, 41, Wellington Street,  
Strand, W.C.

**South of England.**  
**LARGE GARDEN, 20 Acres**, with Twenty  
Greenhouses and Vineries. £7000 has been spent on the  
property. Seven years' lease. Two cottages inclusive. £150  
a year. ELDRIDGE, Farnmouth.

**TO LET, a Small JOBBING and FLORISTS'**  
NURSERY, consisting of 4 Houses and several Pits,  
exactly situated, in most fashionable part of Leicester. An  
advantageous opportunity for an energetic and enterprising  
man.—Apply, HARRISON AND SONS, Royal Midland Seed  
Establishment, Leicester.

**TO BE LET, on Lease, 7, 14, 21, or 99 years,**  
1 to 10 acres of excellent GROUND. Rents from  
£3 to £12 per acre. Suitable for Nurseriesmen, Florists, &c.,  
with the option of purchase at any time. Near the main road,  
Enfield Highway, about 9 miles from London. No tithes or  
land tax. Apply to the owner,  
Mr. H. MOORE, 59, Bishopsgate Street Within, E.C.

**TO BE LET, a TOWN MANSION**, with  
large and singularly picturesque Gardens of 1½ acre,  
believed in with fine old Timber, affording shade and retirement;  
Lodge, first-class Stabling, Glasshouses, full-sized Billiard-  
room, full-sized croquet Tennis Lawn and all accessories.  
House for many years in same occupation and is in excellent  
repair. It is but seldom that a property of the kind can be  
secured, according as it does advance which are usually only  
obtainable in the country, although in this case within but  
little more than a mile of Regent Street.

Messrs. LUMLEY, 22, St. James's Street, S.W.; or Messrs.  
DEBENHAM, TOWNSON, FARMER, and BRIDGEWATER,  
80, Chesham, E.C.

**Durant's Arbour Estate, Ponder's End, Middlesex.**  
To NURSERYMEN, FLORISTS, and OTHERS.

**TO BE LET, on Lease, for 21, 60, or 80 years,**  
1 to 50 acres of excellent MEADOW LAND, from £3 to  
£11 per acre, with the option of the purchase of the freehold  
within the first 9 years. No tithes or land tax.  
Apply to A. AND G. GUYVER, Land Agents, &c., Ponder's End.  
N.B. Several Nurseries established on the estate.

Reports. Sold in Tins, 1s., 2s., 6d., 5s., 6d., and 10s. 6d. each,  
or 1 cwt. bags, ready 15s. By all Seedsmen, or apply direct to  
W. H. BEESON, Carbrook Bone Mills, Sheffield.

**NATIVE GUANO.—Price £3 10s. per ton**  
in bags. Lots under 10 cwt., 4s. per cwt.  
A 1 cwt. sample bag sent, carriage paid, to any Station in  
England on receipt of post office order for 1s.

**Extracts from Twelfth Annual Collection of Reports:—**  
NATIVE GUANO for POTATOS, VEGETABLES, VINES,  
and FRUIT.—G. COUSINS, Walton-on-Thames. "Used for  
Potatoes. Result: very excellent crop; remarkable size and  
good quality. Can highly recommend it."

D. WILLIAMS, Head Gardener to the Rt. Hon. Lord Wimborne,  
Stanford, Dorsetshire, Wimborne. "Used for Vines, Peaches,  
Cranberries, Strawberries, kitchen garden crops, with  
very good results. First class manure for pot Strawberries."

NATIVE GUANO for ROSES, &c.—T. ST. CLAIR, Rose grower by  
appt. to H.R.H. the Princess of Wales, Strathmore Hill.  
"Used for standard and dwarf Roses. Result: excellent growth,  
fine bloom, and perfectly free from blight the whole season."

A. F. BARNON, Royal Horticultural Soc., Chiswick. "Without  
doubt, a very valuable manure, and easy of application."

Orders to the NATIVE GUANO CO. (Limited), 29, New  
Bridge Street, Blackfriars, London, E.C., where Pamphlets  
of Testimonials may be obtained. Agents Wanted.

## DONATIONS and SUBSCRIPTIONS

WILL BE THANKFULLY RECEIVED BY

**A. F. BARRON, Hon. Sec.,**

Royal Horticultural Society's Gardens,  
Chiswick, London, W.

To Landscape Gardeners and Contractors.  
**THE RAMSEY TOWN COMMISSIONERS**  
invite TENDERS for carrying out the work in connection with the MOORAGH PARK and LAKE. The work comprises the Construction of Lake, the Forming of Roads and Walks, Laying-out and Planting of Park, and the Erection of Stables, Keeper's Lodge, &c., in accordance with Plan and Specification, which may be seen at their office. Specification may be had on application to the undersigned. Sealed Tenders, endorsed "Tender for Mooragh Park," to be sent in to the undersigned on or before the 1st day of August next.

The Commissioners do not bind themselves to accept the lowest or any Tender.—By order, **JAMES BELL,**  
Clerk to the Ramsey Town Commissioners.  
Town Commissioners' Office, Ramsey,  
Isle of Man.—June 28, 1888.

## NEW PELARGONIUM, "DUCHESS OF TECK."

Awarded a First-class Certificate at the Manchester Royal Botanical and Horticultural Society's Summer Exhibition of 1887. It is a white Regal decorative variety, semi-double, immense crosses, the flowers are erect, petals undulated; distinguishing it from the ordinary Pelargoniums. It is novel and conspicuous; has a compact habit, and is one of the best Pelargoniums in cultivation. It is invaluable for cut flowers where white is in demand.

3s. 6d. each, 30s. for 12 plants, 50s. for 25 plants.  
Cut Flowers sent on application. Sent out by  
**FISHER, SON, and SIBRA, Handsworth Nurseries, Sheffield.**

**80,000 CLEMATIS**, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5½-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—**RICHARD SMITH and CO.,** Nurserymen and Seed Merchants, Worcester.

**OUTBUSH'S MILL-TRACK MUSHROOM SPAWN.**  
Too well known to require description. Price, 6s. per bushel (1s. extra per bushel for package), or 6d. per cake; free by parcel post, 1s.

None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached. **W.M. OUTBUSH and SON (Limited),** Nurserymen and Seed Merchants, Highgate Nurseries, N.

**CANNELL AND SONS,**  
Home of Flowers, Swanley.

TWENTY-SEVEN MEMBERS OF THE EASTBOURNE  
HORTICULTURAL SOCIETY, accompanied by their President,  
the Mayor of that Town (G. Bolton, Esq.), made a special  
journey to Messrs. Cannell & Sons' Home of Flowers, Swanley,  
on Wednesday last, 4th inst. H. Cannell, Sen., was awaiting  
on the platform their arrival, and met and welcomed his old  
friends with his usual hearty greeting, and at once escorted  
them to one of the greenhouses, where refreshment in plenty  
was at their disposal. The sharp appetite consequent on so  
long a journey having been somewhat appeased, all were per-  
mitted to roam at their leisure through the many glasshouses.  
Begonias, Fuchsias, Pelargoniums, Chrysanthemums, claimed  
much admiration, also other departments and the grounds.  
After about three hours examination of the various families of  
plants, the signal sounded for (dinner) a cold collation, which  
was in readiness at the Temperance Restaurant. The chair  
was occupied by their President, and ample justice was done to  
the viands plentifully supplied by Messrs. Whitehead. A journey  
was then made to the Strawberry picking district: 50 acres in  
one piece, filled up with astonishment. At 6 o'clock P.M. the  
members started on their return journey, evidently delighted  
with the wonderful sights they had seen.

UNDER ROYAL PATRONAGE.

## BEGONIA EXHIBITION

*The Grandest Floral Display  
in London.*

Open to the Public every day (Sundays excepted) from  
June to September, 9 a.m. to 7 p.m. daily.

ADMISSION FREE.

## OUR EXHIBITIONS OF BEGONIAS

Have been celebrated for their varied beauty  
and extent for the past few years, but the  
COLLECTION now on view is superior to any  
of the kind ever yet seen, both in single and  
double varieties, the shades of colour being quite  
indescribable, and must be seen to be appreciated.

All lovers of flowers are cordially invited.

Nearest Railway Stations are Catford Bridge, Mid Kent  
Line (S.E.R.), from Charing Cross, Waterloo, Cannon Street,  
and London E.R. & Forest Hill (L.B. & S.C.R.), from  
Victoria, Kensington and West End, Croydon, &c.; also from  
Liverpool Street.

## VEGETABLES AND FRUIT IN JERSEY.

AMONG the many useful innovations which  
have been introduced at the French Min-  
istry of Agriculture none has been of more  
practical service than the publication of a *Bul-  
letin*, which appears about eight times a year,  
and which contains a variety of articles interest-  
ing to those who are concerned in the cultivation  
of the land. One of the latest of these reports  
is from the pen of M. Féret, who has just  
retired from the French Consulate of Jersey.  
M. Féret, who deals with the agricultural and  
horticultural progress of the island during the  
past year, devotes the bulk of his report, of course,  
to the cultivation of early Potatoes, which may  
be described as the staple agricultural industry,  
and he points out that the result of last year's  
crop was the very contrary of what might have  
been expected. The cultivation of early Potatoes  
is, from the very nature of things, a costly pro-  
ceeding, and it is by selling them at a high price  
that a profit is to be obtained. In order to obtain  
a high price the crop must be an early and a  
good one, while it must also be a fairly heavy  
one. But it so happened that last year the  
Potato crop in Jersey was neither early nor  
heavy, and yet it yielded a good return, this  
being due to the good quality of the Potatoes  
when lifted. The Myatt variety, which is the  
earliest, and was lifted last year about May 25,  
did not promise well, but the Royal Jersey Flukes  
and the Prince of Wales, which came next in  
order of maturity, were a splendid crop. M.  
Féret says that the total area under cultivation  
was about 6300 acres, the total production  
being about 2,670,000 cabots, or 52,340 tons, the  
cabot being rather under a hundredweight. The  
average price per cabot having been about 3s. 3d.,  
the total value of the crop may be put at £435,337,  
as against only £344,268 for 1886, when the total  
crop was 50 per cent. larger than in 1887, but  
fetched only 1s. 9d. per cabot, as against 3s. 3d. It  
is curious to note how the price of Potatoes varied  
during the eleven weeks of what may be regarded

Royal Seed Establishments,

CHESTER.

as the season, for in the first week of last year Potatoes were worth 8s. 10d. per *cabot*, going down to less than 2s. 6d. in the three last weeks. In fact, last year was the best, according to M. Férét, which the Jersey Potato growers have ever had, and there can be no doubt that figures endorse his statement, the value of the Potatoes sold being just double what it was ten years ago, since which date the area under cultivation has increased quite 50 per cent., while there has been an almost uninterrupted advance in the quantity of the crop and its selling value. There is an exception as to the increase of the crop last year, for it was only about 8 tons an acre, or 4 less than in 1886; while in the three years, 1882–1884 there was also a heavier crop, though prices did not rule so high as in 1887. M. Férét then enters at some length into the cost of production, which he estimates at £47 10s. per acre, made up as under:—

	£	s.	d.
Rent ... ..	9	3	0
Manure ... ..	15	0	0
Ploughing ... ..	5	15	6
Planting ... ..	1	8	0
Seed ... ..	9	3	6
Hoeing and earthing ... ..	1	8	0
Digging ... ..	3	9	0
Transport ... ..	2	6	0
	£47	10	0

The acreage value of the crop was about £72 an acre, leaving a clear profit of £24 10s., or nearly three times the profit of 1886. In fact, the average profit for the last ten years has not much exceeded £12 an acre. M. Férét adds, that the excellence of the Potato crops last year made amends for the general failure of all the other crops in the island.

After incidentally remarking that the cattle and butter trade have come almost entirely to an end, and that there are only 5800 acres under arable cultivation, other than the 6300 acres in Potatoes, he winds up a very interesting report by some account of the Grape growing in Jersey.

#### GRAPE.

The Grapes grown are of two kinds, the winter and the summer Grapes. The summer varieties include the Black Hamburg, which is more cultivated than any other, producing about two-thirds of the whole crop, selling at 3s. a pound at the end of May, and coming down to 8d. in August; Lady Downe's Seedling, the Black Muscat, the White Muscat of Alexandria, the two latter ripening in July, August, September, and October. The winter varieties comprise the Gros Colmar, which yields five-sixths of the winter crop, and the Cannon Hall Muscat. The total Grape crop of last year is put by M. Férét at 112 tons, which he estimates at a total value of £18,000; the summer Grapes yielding 70 tons, value (at 7d. a pound) £4100, and the winter Grapes 42 tons, value £13,900. In 1886 the total weight of Grapes grown in Jersey was only 47 tons, and their value not quite £8000. The export of the Gros Colmar Grape had at one time realised large profits for the Jersey growers, but there is now a great deal of competition from Guernsey, which grows some 600 tons of Grapes in an average year, the forcing-houses covering nearly half the area of the island, some of them being 600 feet long by 22 feet wide; whereas in Jersey, with the exception of those belonging to Mr. Bashford, of St. Clements, who has twenty-two houses, some of which are 900 feet long by 24 feet wide, there are none more than 600 feet long. As a rule, the Jersey houses are 66 feet by 18, each of them containing, upon an average, twenty Vines, yielding 35 lb. of Grapes, sold, taking one with another, at eighteen pence a pound. This price seems, at

first sight, to yield a large profit, but it does not always do so, as the cost of cultivation is very large. M. Férét estimates that while a house 66 feet long by 18 brings in £42 for its 700 lb. of Grapes, the actual cost of growth is £20. To this must be added the cost of constructing and keeping up the houses, to say nothing of the risk of a bad year. In short, M. Férét is of opinion that Grape-growing in Jersey is not likely to develop to the very great extent which seemed at one time probable. This he thinks is in some measure due to the difficulty of keeping Grapes through the winter, and of so obtaining the very high prices which were to be had when there was less competition. It appears quite certain that Grapes which have been forced do not keep so well as those grown in the open. During the winter the Grape-houses are heated day and night, but in spring and autumn heat is only applied during the night, M. Férét remarking that it is only by long experience and close observation that the Grape grower can ascertain the proper amount of heat necessary at certain seasons.

#### PEARS, &c.

The Pear crop in Jersey was not a good one last year, as, owing to the drought, the choice varieties, such as the Doyenné, the Duchesse, and the Chaumontel, did not attain half the size they usually do, and at the autumn exhibition at St. Heliers, twenty-five selected Pears were found to weigh only 17 lb. Altogether the Pear crop amounted to only 140 tons, value £2100, as against more than £3900 in 1886. The Apple crop, on the contrary, was a very satisfactory one, as 1575 quarters (a quarter is nearly 460 lb.) of table Apples brought in £1400, while 3150 quarters of cider Apples fetched £1600, the value of the crop being about £150 in excess of 1886. The Tomato was also a very good one, the 5 acres in the open air and under glass yielding 132 tons, value £8000; but Cauliflowers suffered from the drought, and the 7 acres under cultivation yielded only 40,000 heads, value £320, the production being so small that none were exported to London. Other vegetables, such as Radishes, Asparagus, Celery, Onions, Parsley, &c., cultivated upon an area of 145 acres, brought about £6 per acre; and M. Férét summarises the production of Jersey during the past year as follows:—

Description of Crop.	Acreage under Cultivation.	Total Value.
Potatoes ... ..	6300	£455,337
Corn crops ... ..	2025	20,872
Forage, Roots, &c. ... ..	1227	49,475
Fruits ... ..	180	22,980
Vegetables and Salads... ..	175	13,265
	9907	541,929

## NEW OR NOTEWORTHY PLANTS.

### THUNIA CANDIDISSIMA, n. sp.\*

This is stated to have the habit and appearance of *Thunia Marshalliana*. I have at hand a nodding inflorescence of six flowers. The greenish bracts exceed in length the stalked ovaries. The spur is inflated and bilobed, just as in *Thunia Marshalliana*. The trifid lip has the anterior edges of the side-laciniae neatly toothed. The central lacinia has filiform processes, and a very few similar processes are scattered in two lines on the disc. There is no sul-

\* *Thunia candidissima*, n. sp.—Affinis *Thuniae Marshallianae*: labello trifido, angulis lateralibus denticulatis, lamina mediana denticulata medio apiculata, cristulis filiformibus super carinam quatuor calami cylindricato crasso apice obtuse bilobo, flores candidissimi. H. G. Robb, f.

phur colour anywhere on the flowers. This highly interesting novelty was very kindly supplied me by Sir Trevor Lawrence, Bart., M.P., P.R.H.S., from his wonderful collection. It was found on an imported *Dendrobium Wardianum*. *Semper aliquid novi ex Burford Lodge!* H. G. Robb, f.

### EPIDENDRUM AURICULIGERUM, n. sp.\*

This is very much like *Epidendrum Brassavola*. The long narrow sepals and petals are quite the same, but smaller. The stalk of the lip has auricles between its base and the isthmus. The anterior lacinia of the lip is triangular acuminate, much longer than the upper part. There are two long swollen callous lines between the auricles, and three short ones in front. The mid-lacinia of the androclinium is trifid, the side lacinia serrate, the mid-lacinia cuspidate. The colours were faded when the plant came into the possession of Sir Trevor Lawrence, Bart., M.P., P.R.H.S., who kindly forwarded me flowers. H. G. Robb, f.

### ANGRECEUM TRIDACTYLITES, Rolfe, n. sp.

The species of *Angraecum* are becoming rather numerous, but the present one appears to be quite distinct from anything hitherto described, and moreover it is a most remarkable one. It is very closely allied to the South African *A. bicaudatum*, Lindl., in every respect; but the side lobes of the lip are narrowly setiform and entire, not broken up into a number of small teeth, as in that species. The flowers are buff, or almost apricot-coloured. The plant was sent to Kew by T. B. Griffith, Esq., Colonial Secretary at Sierra Leone; among a collection of Orchids from that country, and has just flowered in the Kew collection. The following is the technical description:—Plant erect, at present 6 inches high. Pseudobulbs sub-compressed, with two sub-acute angles a quarter of an inch broad. Leaves distichous, numerous, narrowly linear, unequally bicardate,  $3\frac{1}{2}$ –5 inches long, 5–8 lines broad. Raceme lateral, nearly horizontal, slightly recurved, 2 inches long, with eleven flowers arranged in two distichous rows; bracts very shortly triangular, broadly amplexicaul. Flowers horizontal, 4 lines in diameter. Ovaries sessile, 2 lines long. Lateral sepals ovate, dorsal one a little narrower. Petals lanceolate-linear, like the sepals, acute. Lip trifurcate, the basal part oblong, with a pair of small marginal fleshy teeth at the base, the central lobe acutely triangular, the lateral ones somewhat longer, sub-setiform, and recurving laterally. Spur 5 lines long, uniform, a shade narrower at the base. Column stout and very short, with a pair of small rounded fleshy wings at the apex. The name applies to the very curious lip. Several other species of West African Orchids have recently flowered at Kew from the same source. R. A. Rolfe.

## A TOPSY-TURVY HIPPEASTRUM.

On a plant of Thomas Spede, I found an upside-down flower. The ordinary *Hippeastrums* have the upper petal external and the lower petal internal, and the two most brilliantly marked petals are the upper internal ones. In this case there was only one brilliantly feathered petal, the upper internal; moreover, it was larger than the other two internal ones. The stamens and pistil were as usual, but reposing on the lower outer petal, instead of on the lower inner petal. The curious part of this flower was that only the petals appeared twisted out of their usual position, while the organs of reproduction were normally situated.

What I observed on a former occasion with regard to the *Gladiolus*, viz., that on the same spike both normal and twisted flowers occur, and what may be

\* *Epidendrum auriculigerum*, n. sp.—Aff. *Epidendro Brassavola*: labello imi-basi, columnae adnato, utrinque obtuse parviculicula, inter ungum et isthmum brevem, callis elongatis inter auriculas, callis ternis brevioribus antepetiosis, lacinia antica hastato-triangula acuminate elongata; androclino alba petalis trifidis, lacinia mediana subulata aristata, laciniae laterales serratis. Exc. ill. eques Trevor Lawrence. H. G. Robb, f.

seen also in some Orchids, viz., in the *Disa* and others, with the labellum uppermost, is seen also in this *Hippeastrum*. I noticed from a distance that there must be something abnormal in this flower, the lower petals being unusually large, and this was because one of the large outer ones was lowermost.

It is not impossible that in all the curious modifications we observe in flowers, we may sometimes exaggerate the influence of insects in bringing about such variations. Supposing such a flower as this to occur in Nature, and to become fertilised in the usual way by pollen of a normal flower, probably this variation would be neutralised, and thus extinguished; on the contrary, if other similar abnormal flowers were in the vicinity, and their pollen happened to fertilise this one, the influence of both parents would then be concentrated in the same direction, and probably in subsequent generations more abnormal ones might occur, and so eventually give permanence to this variation, without any special influences having been exercised, by any special insect to modify progressively the flower. The organs of reproduction, being in the normal position, would require no change in the insect to effect fertilisation.

It would appear, therefore, that every variation in a plant need not necessarily be of some advantage to it, in order that it may be perpetuated, and, so to speak, become a reason for selection. I believe that many variations in flowers may have originated accidentally (if this term be admissible), and that they are there now because they were inherited with other useful variations.

In connection with *Hippeastrums*, I have seen a very interesting and curious variation, viz., the flower-scape, instead of originating in a side bud, is the prolongation of the central or terminal bud of the bulb. When the bulb flowers, therefore, its life ends, and it perishes, leaving only the effects to continue that variation. In the *Hyacinth*, however, the flower-stem appears to be also a continuation of the central bud, yet the bulb lives on, enlarges, and flowers again [from a lateral bud]. Not having, however, made a study of the *Hyacinth* bulb, I cannot say whether this is really so or not. Perhaps some one else may be in a position to throw light on this point. *E. Bonavia, M.D.* [See *Henry's Elementary Course of Botany*, ed. 1884, p. 27, with illustrations. Ed.]

## LIFTING AND REPLANTING DAFFODILS.

THE question of lifting the bulbs of Daffodils depends so much upon soil and climate that no general rule will meet all cases alike. Like Mr. Walker I should like to be able to lift and replant the bulbs every year, but not being a nurseryman it does not follow that I should do so in every case. In the case of all the robust, strong rooting varieties I should prefer to lift a third of the stock every year, feeling sure that all kinds are benefited by being lifted after the third season of growth in the same place. Delicate and fine-rooted kinds like *N. pallidus praecox* are certainly best lifted every year, indeed unless this is done here we should find no bulbs left after the third year. The same is true of *N. triandrus*, *N. tazetta* in variety, and more especially the wild Indian, Cyprian, and African kinds. The Dutch seedling varieties live and flower freely for years on suitable soils, but even these never give such fine trusses or bunches of flower as when replanted every third year.

We must never forget that on all soils at all congenial to the Daffodil there is a time when the bulb exists without either roots or leaves. At this particular season it is like a cricket-ball, and as then dug and replanted it is benefited by the operation, it being of course taken for granted that the operation is rightly performed. As to the "lifting and storing" of Daffodil bulbs, it is a question of concern to the nurseryman only. He must keep his stock aboveground for sale, and that he extends this season far too long is well known to all amateurs really conversant with bulb culture. After all, we will excuse the trader, because some amateurs who

do not know anything of the economy of bulb life never think of ordering their "flower roots" until the last moment, and then they too often grumble that their bulbs do not bloom well!

The real amateur cultivator of bulbs has nothing to do with storing bulbs in any shape or form. It is a necessary evil to the dealer, but to the amateur storing should always mean deterioration. When the amateur or gardener digs his bulbs, they should be at once replanted in well-prepared soil, or if stored at all it should be in dry soil or in sand—never on open shelves exposed to the air, nor in exposed heaps to sweat and become covered with the mycelium of fungi. Any bulb exposed on shelves to the atmosphere loses somewhat by evaporation—it is for the time being "a fish out of water."

Most of our Daffodils are planted in rows of twelve to eighteen bulbs in a row, and our method of digging and replanting is as follows:—We bring as many 10-inch flower-pots as there are rows, and into these the bulbs are placed as they are dug, along with the label belonging to each kind. The bulbs in the pots are at once covered over with dry soil until they are replanted again, which takes place as soon as possible. Out of the ground and in again is our plan, and as so treated we get very fine growth the next season.

In preparing the soil for replanting we use no manure, but plenty of sea-sand and burnt earth, and refuse of all kinds from the rubbish fires. The ground is worked up fully 2 feet in depth, and the bulbs in the rows are entirely surrounded with sand before the soil is filled in over them.

On deep rich soils of a sandy or gravelly character *Narcissi* generally lose their leaves and roots at the end of July or early in August, but on some northern cold wet soils the leaves and roots do not die off so early or so suddenly, and in such places elevated beds well dressed with sea-sand and burnt earth assist the natural ripening-off process. Crude farmyard manures should never be used for Daffodils, and I believe when Mr. Walker manures his land, as he often does, pretty heavily, it is devoted to a crop of Peas, or Potatoes, before bulbs are again planted thereon, and a similar rule obtains in Holland. We have certainly had a fine bloom of *N. Horsfieldii*, *N. bicolor*, *N. Sir Watkin*, and other kinds from newly replanted bulbs as ever we had from old-established ones. The fact is, that when you dig fine big bulbs just at the time before mentioned, when leaves and roots have naturally died away, the replanting of such bulbs in fresh soil develops their contents to the utmost, and finer flowers and leaves are the rule here than if we had left such bulbs beyond the second or third year undisturbed. If the old-established or three-year-old theory was right, one might expect it to hold good with *Hyacinths* as well as with Daffodils, whereas everyone knows that the contrary is the rule. The rule in Holland, where bulbs of all kinds are, let us say, as well grown and cultivated as in England, is to lift all bulbs every year, and this is done in stock-taking, apart from trade in flowering bulbs, in which latter case it must perforce be done.

Of course I know that on suitable soils some *Narcissi* will grow and flower fairly well for ten, twenty, or fifty years undug in gardens, and in a naturalised state no doubt some Daffodils have existed in fields and woods or in hill-side pastures for centuries; but if you dig up these bulbs and cultivate them in a garden their flowers, as a rule, become very much improved. The Tenby Daffodil may be cited as an example of what I mean.

After all, the best plan in practice is to find out the best course to pursue on one's own soil and in one's own locality; and, answering for myself and a soil which naturally suits the Daffodil, I find replanting tender varieties every July or August, and the stronger sorts every third year, to give the best results. There is one point bearing on this subject of replanting annually worth noting. It is this: when Daffodils get out of health and vigour nothing restores their energy like annual replanting in clean fresh soil and sand. Freshly imported bulbs

of *N. moschatas* from Val d'Arras, and of *N. ornatus* from the French meadows, are dug in leaf, sometimes in bloom; hence it follows that such bulbs receive a check from which it takes them a year or two to recover, but the replanting annually of plump well ripened home-grown bulbs at the right season is a very different question.

Of all the yellow Daffodils *N. maximus* is the only one which seems to become stronger if left undisturbed for three or four years in our soil. One must remember that three-year-old clumps of Daffodils are thicker and so look stronger and more floriferous than replanted bulbs at 6 inches apart, but that they really are stronger or more floriferous is open to doubt. After all it is a question every cultivator must decide for himself, but annual replanting being beneficial to weak-rooted, and delicate varieties, it follows that it is likely to be of service now and then to the stronger growing kinds although they may not absolutely require annual attention. *F. W. Burbidge.*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT BOCKING PLACE.

EVERY collection after a time acquires some special features—some section of Orchids, large or small, which are better represented than another. The collection of S. Courtauld, Esq., at Braitre, is noted for its *Masdevallias*, which consist of the best and showiest, and also the more minute of this interesting genus. As a really gorgeous and showy plant, *M. Veitchiana* and its larger variety, *M. V. gigantea*, stand first, then comes the varying but always beautiful *M. Harryana*, of which about a score of varieties, whose colours run from pale lilac to brilliant scarlet, are in bloom.

The vivid and free-flowering varieties of *M. ignea* rank next in point of showiness, and the numerous section of chimeroid *Masdevallias*, chiefly grown in baskets, are curious, beautiful, and continuous-flowering. Over a hundred species of *Masdevallias* are to be found in the house set apart for them, and from the healthy condition of all it is evident that Mr. Alfred Wright, their grower, well understands their culture. Besides the showy species above alluded to, in bloom are *Masdevallia porcellicea*, *M. simul*, *M. Bonplandii*, *M. Bruchmüllerian*, *M. Benedicti*, *M. Carderi*, *M. leontoglossa*, *M. senilis*, *M. chimera rubra*, *M. bella*, many *M. chimera*, *M. troglodytes*, *M. Estrade*, *M. trichete*, *M. triaristella*, *M. muscosa*, *M. trochilus*, *M. achrocoronia*, *M. Schlimii*, *M. gemmata*, *M. anchorifera*, *M. calura*, *M. campyloglossa*, *M. peristerii*, *M. pulvinaris*, *M. torta*, *M. astuta*, *M. rosea*, and various others, some of the more curious, such as *M. gemmata*, which seems identical with *M. trichete* and *M. triaristella*, which is synonymous with *M. triactylitis*, being literally covered with their curious beetle-like flowers.

The requisites to preserve the *Masdevallias* in good health are found to be an equable cool temperature the year round, and especially the maintenance of it as cool as possible during the summer months; a profuse but regulated supply of rain-water according to the season of the year; the plants to be kept moist even in the coldest weather; while the house should be carefully shaded and well ventilated.

No species of Orchids are easier grown than the *Masdevallias* if properly treated, or more miserable-looking if the house be kept too dry, warm, and sunny. The plants of the chimera section, *M. tovarensis*, are much benefited by being kept 5° or 7° warmer in winter than the others.

Cattleyas are likewise a feature, some grand varieties of *C. Triane*, *C. Mendelii*, and *C. Mossiae*, were observed, as well as the phenomenal variety of *C. Triane* with regular crimson dotted stripes up the segments, which was so much admired at the late Ghent Exhibition. The varieties of *Cattleya gigas*, do remarkably well with Mr. Courtauld, producing large and handsome flowers.

The *Cypripediums* of the niveum section were apparently in suitable quarters, the flowers on the

large pans of *C. niveum* being very fine; and *C. bellatulum*, which may be regarded as the finest representative of the group, being also in bloom. *C. concolor*, *C. c. Reguieri*, and *C. Godefroyae* were also well represented. This section of *Cypripedium* require a warm shady place where cold currents of air cannot reach them, and it is above all things necessary to search out a place they like, for they may often be brought from a bad to a good condition by simply removing them to the opposite side of the house to that they have been occupying. *C. Veitchii*, *C. Pearcei*, *C. ciliolare*, *C. Lowii*, *C. Haynaldianum*, and others were also in bloom.

The Orchids in the cool houses which showed good culture, exhibited some fine sprays on *Odontoglossum Alexandrae* and other *Odontoglossums*; there were large pans of *Promenaea citrina* and *P. stapelioides*, and spikes of *Epidendrum vitellinum majus*: some few species of *Lycaste*, *Sobralia macrantha*, *Miltonia vexillaria* and *M. Rooseveltii*, *Epidendrum nemorale*, and *E. oncidioides*, *Anguloa Ruckeri*, *Oncidium bicolor*, and other *Oncidiums*, &c. The warmer houses having placed among them fine specimens of *Nepenthes*, several *Vanda teres* in bloom and bud, *Saccolabium ampullaceum*, some showy *Dendrobies*, and then the *Phalenopsis*-house all the occupants of which are in a thriving condition. In bloom are the pretty *P. sumatrana*, and the rare violet-purple *P. speciosa Imperator*.

#### CRYPTOCHILUS SANGUINEA.

This neat little scarlet-flowered Orchid may now be seen flowering in the Kew collection; its singular flowers, however, recalling those of some *Aloe* or *Gasteria*-like plant, as the sepals are united into a tube somewhat contracted at the apex, and terminating in three small triangular lobes. This tube is pubescent outside, and the margins of the lobes dark brown, the rest being of an orange-red shade. The flowers are borne in an erect, somewhat one-sided spike, each in the axil of a long acuminate rigid bract, the inflorescence thus presenting an appearance somewhat unusual among Orchids. The pseudobulbs are ovoid, and produced in tufts; and there can be no doubt that a well-flowered clump of it would prove an attractive object. There is but one other species of the genus, *C. lutea*, which has somewhat smaller yellow flowers. Both are highly interesting little plants, and are found in various localities in the Himalayas. The name refers to the concealed lip, which is not easily seen, on account of the narrowly tubular outer perianth. *C. sanguinea* was originally discovered by Wallich on one of the mountains of Nepal. *R. A. R.*

#### DEFICIENCY OF COLOUR IN APPLE BLOSSOM.

In the *Gardeners' Chronicle* of June 23, "D. T. F." asks why the want of colour in the blossom should portend a defective crop of fruit? He has himself answered the question by suggesting that the absence of colour indicates debility. This is, no doubt, the immediate cause of the defective crop; but why should debility induce pale flowers? Probably the true explanation is, that the colour of a flower is due to the condition of the [substances mixed with the] protoplasm contained in the cells of the corolla. This protoplasm is brown in the bark, green in the leaves, and usually of various bright colours in the flowers. In the green state it feeds upon the carbon in the air, and thus replenishes itself, increasing in quantity as the leaves expand. In the flower-bud the green colour is lost, and it can no longer feed upon the air, or increase in quantity; the flowers must therefore depend upon the amount of protoplasm in the bud at the time of opening. This protoplasm has to be used up in making new cells for the enlargement of the corolla. If there be only just enough for this purpose, the cells when formed will be empty, and the flower will be white. If there be a small surplus of protoplasm it will form coloured streaks along the veins, or spots, or diffused tints. If there be a large

surplus the flower will be entirely and brilliantly coloured. The amount of protoplasm in the bud will depend partly upon the constitution of the species, and partly upon the propitiousness of the season. It is the latter contingency which makes the paler flowers indicate unusual debility, and therefore danger to the crop. The normal colouring of the flowers depends upon the constitution of the species, and this is dependent mainly upon its position in the life-wave of its genus or family. In the evolution of the vegetable world the production of brightly coloured blossom is the last and latest stage; only the most advanced groups have as yet attained to that stage. In the order Rosaceae the genera *Pyrus* and *Prunus*, to which our orchard fruits belong, are not among these most advanced groups. They are mostly in the stage of white blossom. The Apple is more advanced than the Pear, Plum, or Cherry, and has more colour in its corolla, because there is a greater concentration of protoplasm in the flower-bud, and therefore some surplus after the formation of the corolla cells. The colours which indicate the most advanced condition are yellow, rose-purple, and blue. These are the true secondary colours, and indicate that the molecular condition of the protoplasm has arrived at the maximum of concentrated simplicity. The molecular vibrations are nearly uniform, and will absorb only one of the three primary groups of colour-waves in white light reflecting to the eye the whole of the other two groups, and thus presenting the greatest possible brilliancy of coloured light. *F. T. Mott, Birstall Hill, Leicester.*

#### PLANT NOTES.

##### HELIONOPSIS JAPONICA.

This seems to be the proper name for a plant described in the *Gardeners' Chronicle*, 1887, vol. i., p. 711, under *H. umbellata*. It proves to be a most interesting plant, perfectly hardy in the open air, doing well with treatment similar to that given to *Helonias bullata*, and other plants of this nature. The rose-coloured flowers, of medium size, are borne two or three together on a raceme, 2 or 3 inches above the compact rosette of lanceolate light green leaves. It belongs to the Liliaceae family, and is a native of Japan. Propagation is readily accomplished by division.

##### TRACHYMENE CERULEA.

is a very charming annual, extremely pretty for pot culture as well as for cutting from. Seeds sown during the autumn make good pots for present flowering. Six or eight should be pricked off into a 32-size pot as soon as they are ready to handle, and kept in a cool house or frame until they flower. It is also interesting on account of its flowers being blue, this colour being rare in the order Umbelliferae, to which this plant belongs. This plant was figured in the *Botanical Magazine*, t. 2875, under the name of *Didiscus ceruleus*.

##### EICHORNIA PANICULATA.

or as it is named in the *Botanical Magazine*, 5020—where it is figured—*E. tricolor*, seems to be a species that has not received much attention of late years from cultivators of tropical aquatic plants. When planted in groups consisting of four or five or more plants, it makes a very attractive and showy mass. It is very free-flowering, lasting in bloom for a long time. It forms a very attractive object planted out in a tub in one of the houses of the Botanic Gardens, Cambridge, where it has been in flower for some time past. The plants were raised from seeds sown in February. They grow from 1 to 2 feet high, and close their flowers at night like *E. azurea*, which is also planted in a tub standing by its side. This is not such a free-flowering species as the one in question, but perhaps bears the most beautiful flowers. *D.*

##### CHRYSAETHENUM HEMATOMA

This *Chrysanthemum* in its native country bears a

profusion of lovely pink flowers, and I have been told by those who have resided for some length of time in Madeira that it is an extremely handsome species. Mr. Lowe, in his description of the plant in Madeira, says that it is "one mass of lovely rose-pink flowers, and conspicuous from afar, like a *Camellia* or *Rose bush*—is truly a splendid and surprising sight." Plants sent from Madeira have bloomed in the Botanic Gardens, Cambridge, and the flowers were pure white; but plants that have flowered more recently have a distinct tendency to become rose-coloured, and one we noticed the other day, which had been planted outside in a very sunny situation, quite a rose colour. Strong sunlight, no doubt, is the essential required for realising a likeness to the description given above by Mr. Lowe. Some of the flowers have been fine and large, measuring as much as 3½ to 4 inches in diameter. It is of too straggling a habit for it ever to become a favourite pot plant. It is quite distinct from either *C. frutescens* or *C. Broussonetii*. Perhaps it might be successfully crossed between one of the above-named, so as to give it a better habit. *W. H., Botanic Garden, Cambridge.*

#### IRIS KOROLKOWI.

THE scientific zeal of Russian military officers and explorers guided by the Nestor of Russian botany, Dr. E. von Regel, of St. Petersburg, has within the last twenty years brought to light many new plants from Central Asia, and among them many new Irises. Of these latter not a few are obviously allied to, and yet in certain characters, differ from the group of Irises known as the "*Oncocyclus*" group, of which *I. Susiana* and *I. iberica* are well known examples.

In these two Irises the most striking features, outside the large size and colour of the flower, are the rounded orbicular form of the perianth segments, and the dispersion of the hairs on the falls in place of the compact beard of the ordinary Mediterranean "bearded" Iris. These characters are correlated with (1), large, generally inflated, and always persistently green spathe-valves; (2), a rhizome in which the new buds instead of being closely adpressed to old ones, are separated by a larger or shorter neck, so that each bud stands out singly; and (3), large seeds with a conspicuous light coloured strobile, or appendage. These latter three characters are the really distinctive characters, for in some Irises, such as *I. acutiloba*, which certainly belongs to the same group as *I. iberica*, the perianth segments are narrow (hence the name *acutiloba*), and in others equally near to *I. iberica* the hairs are no longer scattered, but are gathered into a distinct beard.

All the *Oncocyclus* Irises have a one-flowered spathe, and the leaves, generally more or less falcate, are as a rule not narrow in proportion to their length. But several of the new Irises from Turkestan and Bokhara, while agreeing with the *Oncocyclus* Irises in the three characters just mentioned—of spathe-valves, of rhizome, and of seed—especially the last—have spathes which are two or three-flowered, and leaves which are narrow and long. They thus form a distinct group by themselves, to which I propose to give the name *Regelia*. To this group *I. Korolkowi*, *I. Suworowi*, *I. lineata* (which I am now inclined to regard only as a very distinct variety of *I. Suworowi*), *I. Leichtlinii*, *I. vaga* (which I am similarly inclined to regard as only a very distinct variety of *I. Leichtlinii*), and others belong.

In this group, *I. Korolkowi* (named after a distinguished Russian general who, unlike some of his British analogues, does not regard it as below his dignity to help the science of botany and the art of horticulture), is distinguished by the large ovate-lanceolate falls, which, narrowing gradually from the blade to the claw, are flexed about half-way down in such a way that the claws of the falls embracing those of the standards form a funnel of some length, from the mouth of which the blades of the falls fall gracefully downwards, while the elegant standards rise erect. Both falls and standards are marked by more or less conspicuous but always

thin-branched veins, and the tunnel formed by the arched styles and the (from side to side) concave claw of the fall, from the intense colouring of the "signal" (or coloured blotch at the base of the blade, which shows the insect the right way to the nectar) on the latter looks like the mouth of a dark but beautiful cavern, in the depths of which the anther shimmers.

Within the limits of the species the lesser characters vary a good deal. In the form originally described by Regel and figured in *Gartenflora*, 1873, s. 225, t. 766, the falls, relatively narrow, are of a general olive-green colour, caused by olive-green brown veins and a like coloured "signal" on a creamy-white ground which has a greenish tinge. I have in my garden a plant which I owe to the kindness of my generous friend, Mr. Max Leichtlin, of Baden, absolutely reproducing the figure in the

Not having seen the flower itself I can say little more about it; it might be called var. *venosa*.

I have another variety in my garden, also the gift of Mr. Max Leichtlin, which reproduces the type, save that the olive-green brown is replaced by violet or puce; this might be called—if a name is really necessary—var. *violacea*.

Lastly, I owe to the great kindness of Dr. Regel, a rhizome, which, sent under another name, turned out to be a very distinct variety of *I. Korolkowi*, characterised by much broader, more obtuse segments, in which the venation is almost wholly obscured by a general violet or purple colour. This form certainly ought to have a name, and I propose to call it var. *concolor*.

In all probability there are other varieties yet to come to light, to say nothing of the new features which cultivated seedlings may show.

FIG. 3.—*IRIS KOROLKOWII*: GREY-LILAC WITH PURPLE VEINS.

*Gartenflora*. This, on historical grounds, should be considered as the type.

A few years ago Mr. Max Leichtlin received, and has since distributed, a very beautiful form, in which the falls and standards are nearly pure creamy-white, with tender unobtrusive veins, and in which the "signal" is of the deepest—almost black purple. It is to my thinking one of the most beautiful of all Irises. It was fairly well figured in the *Garden* (November 7, 1885). If this variety must have a name it should be called var. *Leichtliniana*.

The flower sent this spring to the Royal Horticultural Society from Kew (see our issue for June 2, 1888, p. 695) and shown in the accompanying illustration (see fig. 3), though the figure unfortunately gives only the flower, as shown, omitting many essential characters of the plant, is obviously another variety of *I. Korolkowi*, distinguished, as the woodcut shows, by the obtrusiveness of its veining.

As to culture, I will only say, that those who can grow *I. Susiana* without artifices can grow *I. Korolkowi* in the same way. For myself I am obliged to roast it in summer (June, July), by putting a temporary light over it. When I do this I produce rhizomes which meet with the praise of my friend Max Leichtlin. If I do not do this the plant gracefully waves its hand and vanishes. It seems rather to enjoy than otherwise the buffets of an English winter, and for soil appears to like a gritty, sandy, but still stiff loam. *M. Foster*.

#### LILY OF THE VALLEY POISONOUS TO FOWLS.

—The *Revue Horticole* publishes an account of the poisoning of a brood of fowls by the decaying flowers of this plant. Only the parent birds survived, and one out of ten chickens.

## CULTURAL MEMORANDA.

### TOXICOPHLEA SPECTABILIS.

This plant is of branching habit and produces large clusters of white flowers from the points of the shoots and the axils of the leaves during the summer months. Cuttings of the young growths taken off any time during the spring and summer months and inserted in small pots filled to within half an inch of the rims with peaty soil, and having a surfacing of silver sand, placed in a hotbed or anywhere in heat, watered, shaded, and kept close for a few days, will soon root. They should then be potted off singly into 3-inch pots, returned to heat, watered and lightly shaded from sunshine until the roots have taken to the soil, when shading should be discontinued. As the shoots grow, pinching the points should be done to make them branch out, and a shift should be afforded them as soon as the roots touch the pot sides, the final shift into their flowering-pots being early in September.

### TABERNEMONTANA CORONARIA FLORE-PLENA.

No collection of sweet flowering plants that does not include this popular plant is complete. It is of free growth; the flowers, which are pearly-white, appear on the points of the young shoots. As the flowers wire well, they are very useful for buttonhole and bouquet work. Cuttings inserted in 3-inch pots filled with peaty soil and sand, put into a warm frame or pit, watered, and kept close, will become rooted in a few weeks, and should then be potted off singly into the same size pots as they are rooted in, putting them back in heat, giving water at the roots, and shading from bright sunshine for a few days until the latter have pushed into the new soil, afterwards stopping the shoots, and giving more room at the roots by shifting into larger pots when necessary, using the peat in a rough state each succeeding shift.

### SPRING-STRUCK CARNATIONS.

These should now be fit to put into their flowering-pots, using five-sixths of good fibry loam and one-sixth of sweet leaf-mould, with a little sharp sand added, potting firmly. Support the flower-spikes by small sticks, and stand the plants on coal-ashes in a sunny situation; and after the roots have pushed well into the new soil, weak liquid-manure should be supplied to them two or three times a week.

### HERRACEOUS CALCEOLARIA.

A pinch of saved seed should be sown next week, and again in a fortnight afterwards. Fill well-crooked shallow pans to the rim with a compost consisting of sifted light loam and leaf-soil—about three parts of the former and one of the latter—pressing the same firmly together. Then immerse the pan in soft-water for a few minutes, and half an hour later sow the seed thinly over the surface; cover with a sprinkling of silver-sand, and place the pan under a small handlight in a shady corner in a cool greenhouse, or out-of-doors, previously placing a square of glass with a covering of moss over the seed-pan. The latter should be removed as soon as the seedlings appear, in the course of a fortnight or three weeks from the time of sowing. The young plants, when large enough, should be pricked out at 2 inches apart in similarly prepared pans, be placed in hand-lights, watered through a fine rose, and shaded from sunshine until the roots have taken to the soil. In due time they should be potted off singly into small 60's, 48's, 32's, and 24's.

### THE CYCLAMEN.

A sowing of *Cyclamen persicum* in variety may now be made, using shallow pans filled to within an inch of the top with a mixture consisting of three parts light sandy loam and one of leaf-mould, making it moderately firm with the hand before sowing the seed, which should be covered lightly with some of the same description of sifted soil. Water through

a fine rose, then cover with a piece of glass, over which place a covering of moss, and place the pan on a shelf in a greenhouse, or cool pit, where the temperature is about 50° at night. Remove the covering as soon as the young plants appear, and place, if not already in that position, near to the glass, to prevent the seedling plants from becoming drawn. As soon as large enough to handle, prick out the plants in 3-inch pots, putting three in each pot; water, and return to the same position and temperature as they were in before; afterwards, before they touch, potting them off singly into the same size pots, and attending to them in the way of moisture at the roots, as well as overhead, so as to prevent the leaves being attacked with spider and thrips. The plants should be shifted into larger pots before they get matted at the roots, using the compost in a rougher state at each succeeding shift. *H. W. W.*

#### GLORIOSA SUPERBA.

This beautiful East Indian plant, known also as *Climosyris*, is seldom seen grown well, and a few remarks on its cultivation may be of value to your readers. The flowers are of an orange and red colour, and last a week or ten days in perfection. The soil they succeed best in is loam, leaf-mould, old cowdung, and silver-sand in about equal proportions. The first or second week in March is the best time to pot them, to flower in June and July, employing well drained pots three parts filled with soil, in which the tubers should be carefully laid, covering them with 2 inches of soil, the pots to be finally filled up when the shoots are a foot high. No water should be given until the tubers start into growth; then place the pots in a strong moist heat, watering freely as they require it, and train the plants as growth proceeds. For exhibition purposes four tubers in a 13-inch pot will cover a good-sized balloon trellis; but for cutting or ordinary decorative purposes one tuber in an 8-inch pot, and the shoots trained to sticks or up a rafter, will have a very good effect. As soon as the flower-buds show the plants will be greatly benefited by a little guano-water given once a week. When flowering is past and the leaves turn yellow water should be gradually withheld, and in December the tubers may be turned carefully out and placed in silver-sand until the next season. *W. Hodge.*

#### AMERICAN PRIMROSES.

GROWERS of *Primulas* will find the American species of no little value as late flowerers, in addition to the Himalayan kinds now so plentiful in our gardens. Within the last half-dozen years great strides have been made in this genus, not so much in numbers as in the length of time over which the flowering season extends; indeed, with careful management, we may have some of the *Primroses* all the year round.

America gives eleven species, six of which are peculiar to that continent, all charming flowers, capable of great range of variation and development, and worthy a first place in all collections of hardy flowers. These are, *P. angustifolia*, *P. cusickiana*, *P. mississinica*, *P. Parryi*, *P. Rusbyi*, and *P. suffrutescens*; while *P. nivalis*, *P. sibirica*, *P. farinosa*, *P. cuneifolia*, and *P. borealis*, are also widely distributed in Asia and Europe.

*P. suffrutescens*, in flower now, is one of the most interesting *Primroses* we have yet seen. It is found at elevations of 9000—11,000 feet above the sea-level, on exposed rocks, Sierra Nevada, above the Yosemite Valley, Silver Mountains, &c. It was first discovered by Bridges, who describes the thick matted roots as filling the crevices of the rocks, and that they are more creeping than any other species—facts which are fully borne out by the plant as we know it in cultivation. The leaves are thick and leathery, spatulate, and coarsely toothed, somewhat like minima at the apex. Crowded near the growing point, those behind dying off, leaving bare stems, which throw out roots on the under-surface, enabling

the plant to move along. The flower-stem rarely exceeds 3 or 4 inches in height, bearing 3—7 deep maroon-purple flowers, with a yellow eye, each of them just under an inch in diameter. This plant, we find, does well on shingle, well elevated on the rocky, and easily increased by division of the branches.

*P. Rusbyi* is a comparatively new species, recently described by Greene in the *Bulletin* of the Torrey Club, viii., p. 112, the original plants having been found, by the gentleman whose name it bears, on the Mogollan Mountains, New Mexico. It has also been found on the summit of Mount Wrightson, and the Santa Rita Mountains, Arizona, by Pringle. With us it is perfectly hardy in the open, having passed through last winter unharmed. Unlike *P. suffrutescens*, which is an evergreen, this species, by its habit resembling the Himalayan *P. sikkimensis* and *P. involucrata*, is peculiarly adapted for a climate like that of England. It is quite deciduous, the leaves and stems dying down and forming a little bud, which is easily protected, both from the change of climate and from the feathered tribe, by a handful of fibre, small pebbles, or other porous covering. In habit, &c., it resembles *P. cusickiana*, but is larger in all its parts. The leaves 2—6 inches long, very thin, with an oblong blade, tapering to barely winged petiole; flower-stem 6—7 inches high, bearing 3—10 deep purple-yellow-eyed flowers, an inch in diameter; tube twice longer than the calyx; limb obcordate. This species is certainly a great acquisition to our already large list of *Primroses*, its value being enhanced by its flowers appearing just after the European and before the late Himalayan. *D. D.*

(To be continued.)

## ROSES.

### A PROTEST AGAINST DISBUDDING.

A HIGH authority urged the removal of all the side buds of Roses with stick or toothpick, and this as seasonable work for the month of June, 1888. It is hoped that no one save exhibitors, in search of fat flowers for their Rose boxes, have taken this advice, and that even among these may be found a remnant with sufficient taste left to spare the buds to grace their show blooms. For over full-blown Roses, however beautiful and large, were never meant to bloom, nor stand up, nor droop, alone, else would the graceful garniture of side buds not be given. Virtually these last touches of artistic grace and finish are withheld from a few of our Roses, such as the rank and file of the blooms of *Maréchal Niel*. It is only needful to turn from these bald, though huge masses of gold, to the smaller but profusely budded blooms of *Celine Forestier*, *Triomphe de Rennes*, and *La France*, to see at a glance the artistic value of bud garniture or support to Rose blooms.

We have it on the same authority that the exhibitor never neglects and that the amateur seldom practises disbudding. It is to be hoped that the latter is true now, and will become more so in the future, and that, in fact, the two words seldom or never may be transposed, so that the sentence may read thus—"The exhibitor seldom practises disbudding, the amateur never." Why, indeed, should the amateur who grows his Roses for their beauty in the garden, or in the house, pinch out their side buds with toothpick or blunt stick? The indignant Roses are up in arms all over the garden, and the rustle of their opening buds echoes back the question, Why? "Wild Rose" not only counsels disbudding, but gives his reasons for it. Here they are:—"Where a few Roses are left to cluster together, they are poor in quality; and if you cut one it has a moderately short stalk, while if you cut the whole bunch you might as well have had one good Rose as a cluster of indifferent ones." This is all very well from a mere exhibitor's standpoint; but what would the decorators, or "Wild Rose's" sweet-heart, sister, wife, or artistic friends, or the true lover of Art or Nature say to it? Why, that the sentence begs the whole question, and the verdict given in

favour of such Roses has no solid foundation whatever. I challenge him to test his single blooms against clusters among all his fair sisters, and chronicle the results. These I am confident will suffice to put an end to the picking or pinching out of side buds, unless for exhibition; and even for exhibition such buds should have a place and score a point. There used to be a very wholesome rule in not a few Rose shows, to the effect that the Roses should be shown as far as possible with buds and foliage on a single stem. The National Rose Society might render important service alike to Nature and Art by reviving and enforcing such a rule. "Wild Rose" is doubtless familiar with the following verse from Leigh Hunt:—

"We are blushing Roses,  
Bending with our fullness,  
'Midst our close-cupped sister buds,  
Warming the green coolness."

But what lover of Nature or of Art on reading this verse is not as much or more attracted by the close-cupped sister buds as the full-blown blushing Roses? Nature furnishes us with both, both together, both in contrast, and it seems alike unnatural and inartistic to proceed with stick and toothpick to deprive ourselves of that rich, many-sided, many-formed, multi-coloured harvest of grace and beauty that Nature has laid up for our enjoyment in her rich prodigality of Rose buds. And then what a charming procession of blossom the buds provide for us! It is little wonder that we hear more complaints every year of the shortness of the Rose season. The Roses are forced with sticks and toothpicks to bloom all abreast, and those side buds that would yield the last Roses of the season, if not of the summer, are ruthlessly destroyed.

While writing thus strongly in defence of the close-cupped sister buds I should like also to utter a protest against the wholesale slaughtering of Rose blooms now so prevalent in so many gardens. Roses, trees and bushes, are so cleared of bloom that, like children's pictures they almost need labelling "This is a Rose," for the information of the uninitiated. But, just as no Rose can ever look its best without few or many of its close-cupped sister buds, so every Rose is seen to most advantage on its parent branch, forming part of its natural bunch or cluster. For, as Gerrard Lewis sweetly sings:—

"A gathered flower is but a fading thing,  
Like beauty seen in death;  
Though bright as ever is its colouring,  
And odorous its breath.

Then leave the Rose upon its parent stem,  
Where other Roses be:  
'Twill live perchance long summer days with them—  
A few short hours with thee."

*Rosa.*

### EARLY SUMMER EXHIBITIONS.

WHILE plants grown under glass are little affected by external temperature or fluctuations of weather, and may be relied upon generally to be up to the mark at required periods, external vegetation is less readily responsive, and a very low temperature, with gloomy skies, heavy downpours of rain, and cold winds, does not help to produce that condition of maturity essential in exhibition products.

Vegetables, especially, are late in every way, with at present little prospect of their being pushed along by any access of warmth; indeed, those gloomy weather-prophets who are so ready to predict ill, and asserted that a north-east wind would prevail all the summer, seem to be in expectation of justification for their unpleasant prognostics. The natural product of the weather which, so far, has marked the earlier part of the summer, has been found in coarse growth, without any corresponding cropping products. Ordinary garden vegetation has assumed an almost tropical form, so abundant have been the rains; and with soil so full of manure as gardens usually are, no wonder that Peas, Beans, Potatoes, &c. are running wild in growth, whilst the pod and tuber production is indefinite.

During hot dry seasons it is possible to assist vegetation by giving ample waterings, and thus production is greatly accelerated. When heavy rains prevail it seems possible to do little but sigh for sunshine. The season started very late indeed. Soil was cold beneath, and the atmosphere above was cold also, accompanied by considerable gloom. Later abundant sunshine might have helped to catch up time somewhat, but the weather has been throughout deterring to productiveness, although coarse growth has been plentiful. Such vegetables as Cabbages and Lettuces have revelled in the abundant rains and low temperature, although it is worthy of remark that the winter stocks of Lettuces ran off to seed this year with exceptional speed.

Potatoes have made very tall, lanky tops, and it is to be feared no corresponding progress in the development of tubers. Broad Beans have run up tall where not stopped, and pods are swelling slowly, whilst on Peas the pods by no means keep pace with the haulm, which seems to be carrying off the chief portion of production. Very much indeed do Peas need sunshine to help the pods to fill, as also to give to the contents some flavour.

The lateness of the season, therefore, seems likely to conflict with the summer shows, and cottagers' products can hardly be up to the average. It is doubtful whether, on the whole, were the season studied, all such shows should not have been fixed a fortnight later than usual. Seasons vary somewhat, whilst shows apparently remain immovable in date. To invite from cottagers such products as Potatoes, Onions, Carrots, Turnips, and many similar products, which will only be matured by warmth, so early in the season, is hardly wise, as too often much growing material is destroyed in the effort to find for exhibition that which Nature has, so far, refused to produce. *A. D.*

## FOREIGN CORRESPONDENCE.

### PINUS CANARIENSIS, A LIME-LOVING CONIFER.

On the western Riviera, in my Grimaldi garden, and in that of my neighbour, Mr. Hanbury, at Mortola, this beautiful Conifer (of which a full-page illustration was given at p. 721, vol. iii., n. s.) appears to thrive as well as in the Canary Islands, its native home; yet the soil is not volcanic, as in the island of Tenerife, but the mere break-up of the limestone rocks which form the coast-line of mountains in this region. With me it is one of the Conifers that succeed the best; it grows rapidly, forming a succession of beautiful whorls, with clear interspaces, and is an elegant, handsome tree in all stages of its development, from a few feet, to twenty, thirty, or more. As its introduction on the Riviera is comparatively recent, we do not know yet what altitude it is destined to attain with us, but it grows as if it meant to be a very tall tree—boldly, vertically, compactly. I am grieved not to have known of it as a Conifer, suited to the soil and climate, twenty-five years ago, when I first began gardening on the Riviera. I now never pass one, large or small, without looking at it with admiration, and a feeling of satisfaction at having discovered a Conifer that seems so much at home in my rugged, limestone rocks, and which is such an ornament to the landscape wherever it appears. We propagate it from seed, which sprout like Beans in the seed-pan, not one in twenty failing.

This Conifer seems to do best in ravines and gullies, where, no doubt, there are crevices into which it can extend its roots. In such positions it grows rapidly, even when there is but little soil.

Planted in open situations, on the rocks, in a small amount of earth, it lives, but remains small—a mere shrub, like the *Araucaria excelsa*; but then, in such situations, there are no lateral crevices or fissures into which it can send its roots. I have had to remove all those so planted; not one has done well.

Mr Hanbury has some very fine tall specimens, but all, if I recollect right, are on the side of a deep ravine or gully.

The *Pinus canariensis* does so extremely well on our calcareous rocks that I cannot help thinking that in the Canary Islands it must also be growing on calcareous formations; that it is not confined to volcanic soils. Indeed, I would ask, is volcanic soil specially suited to Conifers? I do not recollect seeing any on the flank of Mount Vesuvius or Mount Etna. I have not, however, been higher than 5000 or 6000 feet up Mount Etna—to the Casa Ingles, so have no personal knowledge of the vegetation of the higher regions.

Although Conifers are more especially suited to granitic schistic soils, some species thrive admirably on calcareous formations, as recently stated in the *Gardeners' Chronicle*. The *Pinus halepensis*, or Aleppo Pine, for instance, covers the limestone rocks of the Mediterranean shores and islands everywhere. It is undoubtedly the commonest tree in the Mediterranean. All or nearly all the Cypresses thrive admirably in our calcareous rock soil. I have recently seen many small specimens of the *Abies Nordmanniana* doing very well on the Riviera, east and west of Genoa, but do not recollect meeting with any large specimens. I think, therefore, it must be a recent but successful introduction in these limestone regions.

Until recently I was afraid that the *Pinus canariensis* might thrive for a time, and then die—as has been the case with me with the Wellingtonias that I have planted—or that it might be naturally a short-lived tree, but these fears have been quite dispelled. Mr. Ernest Hart, the editor of the *British Medical Journal*, published last July in that journal a series of very interesting articles on the Island of Tenerife, which he had recently visited. He therein states that the oldest tree in the island is a *Pinus canariensis*, which was already a grand old tree 400 years ago, when the island was first discovered, and is mentioned as such in the historical records of the time. Thus, so far from being a short-lived tree, it may be able to compete with its countryman the *Dracæna Draco*, or the American *Sequoia gigantea*. The climate of the Genoese Riviera is a marine climate, evidently akin to that of the Canary Islands.

It is said to think that the entire Genoese Riviera might in all probability be clothed with the Norfolk Island Pine (the *Araucaria excelsa*) and the *Pinus canariensis*, but that such will never be the case, owing to the apathy of its southern inhabitants. They are rapidly cutting down their beautiful old Olive trees, and denuding the mountain sides of the Aleppo Pine, for fuel and timber, never planting trees but only Vines. The Mentone amphitheatre is rapidly deteriorating in beauty from this source, and ere long it will be as naked and barren-looking as the Vine-clad hills or mountains which surround Malaga. *Henry Bennett, M.D., June 20.*

### NOTES ON ECONOMIC PLANTS IN HAVANA.

Some interesting notes on Tobacco culture, as well as on the introduction and cultivation of fibrous plants, in Havana, have recently been furnished to the Foreign Office, from which we gather the following facts.

Regarding Tobacco culture, it seems that the markets are affected by the general demand for light-coloured Tobaccos. This demand is said to cause injury to the plant, which, unless artificial bleaching be had recourse to, must be gathered before maturity, with loss of quality and aroma. There is as much Tobacco grown, and there are as good markets as ever, but the growers and manufacturers, in their race after quick returns, force and spoil the plant in the ground and the curing-house, and ship goods that not only no longer command the market, but are undersold by foreign and inferior, but probably more carefully prepared kinds. There is, as a matter of course, a large amount of exquisite and carefully handled Tobacco exported, but the price of this has become so high that it is above the reach of the middle-class consumer, this, however, ought not to

and need not be. Climate, soil, and acreage, are all in favour of a superior and large production that could hold the field against all comers, but the elements to make this a reality—namely, capital, labour, and frugal and unfettered administration—are wanting. The social and political state of the island is not of a nature to attract these elements, and prostration and uncertainty are seen everywhere. Although Tobacco grows well all over the island, the soil and climate of the south-west portion produces the finest. This is known as the Vuelta Abajo, and lies along the foot-hills of the Sierra stretching to Cape Antonio and the northern side of the great plain which reaches from sea to sea across the island. The very best land of the Vuelta Abajo lies near to Consolacion and the lomas on the eastern side of the Cayos which overlook the Palm-covered plain.

The planter's house-made cigars, called "veneros," or "farmers," are celebrated at Consolacion, and possess a delicious aroma, especially when smoked immediately on being made. The leaf is of a very rich, light, coffee-brown, with a slight hairy down on it, which is soft and tender. To test the leaf, the vengero always tries the strength of the material by passing it over his finger in the way one tries the skin of the glove. The "maduro," or the ripest, is considered the very best; but as of late years fashion has ruled in favour of light colours, the Tobacco is dried in such a manner as to get the required shade, but in the opinion of the best judges, to the detriment of the flavour.

The Tobacco seed is sown early in October, after the rains have well soaked the light sandy soil, and cuttings are taken between October and March. Some vegas lying along the arroyos, which are always full of good and abundant water, never fail; others produce only the "trips," or kind used for working up to form the core of the cigar, the outer leaf being of a finer brand. In this consist most of the frauds which prevail very extensively in the trade.

A company called the Cuban Fibre Company (Limited) has been formed in London for cultivating and extracting the various fibres in Cuba, principally the *Sansevera*, or *Leuca de Vaca* plant, which give the best fibres of their class. Preliminary arrangements have been made for planting about 1000 acres in different parts of the island; so that next year the export of the fibre will commence, and will, it is expected, be equal to the best Hemp and some kinds of Flax. The cultivation of these hitherto neglected plants is likely to prove a success, for they take up little of the planter's time, and grow readily on the poorest land, leaving him free to attend to more important cultures. In a single month, which may be in the early spring or in the rainy season, hundreds of shoots or cuttings may be planted, giving later a considerable crop. Cuban labourers with families, who are numerous in some districts, will find this new agricultural industry a steady means of gaining a livelihood.

## THE HERBACEOUS BORDER.

### ANEMONE NARCISSIFLORA.

This is a plant which, to grow well, only requires patience, as it is not particular as to soil, and likes a sheltered border better than an exposed rockery. Several have grown in my garden without any attention for several years. Those which have been longest established, and about which yet show no signs of deteriorating, are about 15 inches high, and as many across. I counted on one plant twenty-seven flower-stalks, nearly all of them five-flowered. The flowers in general appearance and size resemble Apple blossom, being pink in bud and white inside. On some plants the flowers are nearly all five-petalled and on others many petalled. Like *Anemone alpina*, the growth from seed is slow, at least three years being required to reach flowering. I have carefully compared my plants of *A. narcissiflora* with

some plants of the Himalayan *A. polyantha* sent to me from Kew. The leaf of the latter is more robust, and less divided: the flower-stalk thicker, with a tendency to form compound stalks above the bracts. The flowers seem to have the petals more concave on the upper surface. In all other points they resemble those of *A. narcissiflora*. *C. Wolley Dod, Edge Hall, Malpas.*

#### AQUILEGIAS.

It is not many years ago when the new varieties of *Aquilegia* caused quite a stir among lovers of hardy plants, and they were well deserving the notice they then received, and the high character they had; but, unfortunately, one of the best and most striking of them, *A. corulea*, seems almost lost, as it is very seldom one meets with it now. This, no doubt, results from its rather delicate habit, which led to dwindling and weak health, and the only way of keeping and growing anything like strong plants is to sow seed annually, and thus be constantly raising fresh ones and renewing the stock. Another undesirable feature is its tendency to sport; or rather, in common with all the *Columbines*, to become impregnated by the pollen of others; and therefore plants intended for seeding purposes should be isolated, or it is impossible to keep the sort true. The original kind when first introduced had long slender spurs and very large wide open flowers, the petals being of an exquisitely soft pale blue and white, and as the blooms stand nearly erect, they show off to the greatest advantage. As this *Aquilegia* comes early into growth, and is somewhat tender, and often suffers from spring frosts, it is necessary to place the plants in a sheltered position, and they also require a warm well-drained soil—that is, sandy, loose, and open—as they do not succeed well unless their fleshy roots are enabled to draw moisture from the subsoil. The next noteworthy *Columbine* is *A. chrysantha*, which has very long spurs, and much less distended flowers than *A. corulea*, the colour being of a delicate canary-yellow, and the habit of the plant tall and vigorous, the stems branching and blooming freely, which they continue to do for six or eight weeks in succession. With ordinary treatment, and a suitable position, there is no fear of losing this variety, as, unlike *A. corulea*, it is not only of strong growth, but it is a true perennial, and may be increased readily by division, the best time for doing this being just as the plants start in the spring.

Among the older forms of *Columbine*, *A. glandulosa* is one of the best. This has handsome blue and white flowers, and comes into bloom early, and the habit of the plant is strong, but it does not stand being interfered with so well as the one just referred to, and requires care in dividing. Besides the two named, and referred to above, there are now many hybrids, and the best of them are quite worth a place in the herbaceous border; but where they come in well, and are of great value, is in the wild garden, or alongside of woodland or shrubby walks, where, if planted in quantity with *A. vulgaris*, they will cross, and seed freely, and increase and spread, and form quite a feature in that part, where they will make a fine show. To raise the better kinds, seed should be gathered as soon as it is ripe, and either sown thin or in gentle heat in spring, but the plants come stronger if they are got up under hand-lights in August, and wintered by having the lights kept over, and tilted above them. *J. S.*

## THE APIARY.

It is best in any year, whatever may be the weather, not to give much comb-building to do after the commencement of July, and this year certainly not. It always pays to give more foundation as the season goes on. If strong combs which will not break in the extractor are required, it is best to wire the frames. This can easily be done at home. Get some thin tin wire, No. 32, at any ironmonger's. This can now be bought in reels for the sum of a

penny. Lay the frame down on a piece of wood cut to fit easily inside the frame, and about half an inch thick. Bore about five holes, with a very thin awl, through the top bar, and equidistant apart; then bore five in the bottom bar, just opposite the others. Unwind some of the wire carefully from the reel, straightening it a little as you unwind. Put the wire through all the holes, and draw it tight, and fasten the ends so that when complete there are five pieces of wire hanging perpendicularly, and parallel to the two side bars. Now lay a sheet of foundation down on the piece of wood, and lay the frame on top of it. Get a Woiblet spur-embedder, which consists of a small wheel which easily turns on an axis at the end of a piece of metal. Warm the wheel in a flame, or some very hot water, and run the wheel along the wire. The warmth of the wheel, added to a gentle pressure, causes the wire to be embedded in the wax, and a sufficient amount of the latter will be melted, and will cover up the wire so that it cannot be seen. Do the same with the rest of the wire. Now lift the frame from the block, and the foundation will hang beautifully in the centre of the frame, and the wires will keep it perfectly straight and true, and it will keep so while the bees operate upon it. Some people put the wire diagonally on the frame as well, and by so doing make a firmer job of it; but the first-named way of fastening the wire is sufficient, if care be taken not to pull it too tightly. If it is pulled too much the bottom bar will be drawn up—i.e., if that bar is very thin. With all deference to our prominent framemakers, I would suggest that the bottom bar be made a little thicker than is mostly the case; then the wire can be drawn as required without the bar moving. Frames thus wired will not break when put in the extractor, however new they may be. *See.*

## AMERICAN NOTES.

### PACKING.

MR. PETER HENDERSON, of New York, finds storing empty pots in soap-boxes, and then piling up the boxes, better than using a pot-rack; there is less breakage, and the pots can be more readily removed where wanted. He has found the following method of packing the best for very cold weather:—The box is lined with heavy paper; then pieces of board which fit into the box are placed inside, and the box again lined with paper over them; the boards are withdrawn, and the space between the two linings of paper filled with sawdust; an inch thickness of sawdust is thus placed entirely around the plants, but separated from them by one lining of paper. Plants so packed have travelled long distances without injury in the coldest weather.

### MAGNOLIA PARVIFLORA.

This is one of the choicest gems of our garden. We have a fine thrifty specimen between 4 and 5 feet high. It bloomed in May, 1886, but not in 1887, and I find that it is going to bloom again this year. Its flowers in size and form are not unlike those of *M. glauca*; and of a creamy-white colour, with crimson stamens, and powerfully and deliciously fragrant. The flowers opened May 23—after the foliage began to unfold—and dropped before May 30.

### OTHER EARLY BLOOMING MAGNOLIAS.

*Magnolia stellata* (Halleana) began blooming with us about May 20, and was the earliest of all in flower. The plants assume a stocky bush form; the flowers are very numerous, and white, and the petals narrow and spread out or reflexed a little. It has not the stiffness of the other forms. The Yulan *Magnolia* began to open April 28. It is the most showy of all. The flowers are large, white, and abundantly produced on leafless bushes. While striking and beautiful almost anywhere, they are seen to best advantage when they are growing in front of tall evergreen trees, as Pines or Spruces.

Thurber's and several other Chinese *Magnolias*, all well worth growing, are also now in bloom with us.

### COCKSCOMBS AS BEDDING PLANTS.

Many of the florists in attendance at the Chicago meeting of the S. A. F. noted the beds of *Celosias* and *Centaureas* at Lincoln Park in that city, and were much impressed with their beauty and oddity. They were certainly a departure, and very handsome. Head gardener Stromback was continually asked the question, "How do you keep the *Celosias* so dwarf and uniform in height?" In reply to these visitors, and for the information of other readers, we have obtained some notes on his method of handling the plants.

The variety he grows was obtained about ten years since under the name of President Thiers, and Mr. Stromback has kept up his stock by seed of his own saving ever since. The colour of the "comb" is a deep scarlet, approaching crimson. He sows the seed the latter part of March, in pure sand, as he finds that the seedlings damp off quickly if planted in soil. As soon as large enough to handle, the seedlings are pricked out in boxes of soil, and before they have made much growth in the boxes they are potted singly in 2½-inch pots, where they remain until the "comb" shows, when they are at once shifted into 4-inch pots. The temperature of the house is kept the same as for *Coleus*, and the plants are held a little closer until the roots start after shifting. The young plants are kept rather dry at all times, as they are very prone to damp off.

The plants make no growth in height after the "comb" has begun to develop, and to keep them quite dwarf, growth must be retarded until it appears, when they may be treated more generously, as the whole strength of the plant then goes to the "comb." In spite of the greatest care, there will be some plants which are a little taller than is desired, and these can be used in a bed by planting them so much deeper than the others as will make all the tops uniform in height. *American Florist.*

## FORESTRY.

**CLEANING PLANTATIONS.**—It is now high time that all young trees and shrubs were examined, and rank vegetation of whatever kind removed from amongst them. Such work must only be entrusted to careful men, for the damage oft inflicted on the tender stems and branches of young trees by the shearing-hook or scythe when swayed by a careless hand is hardly credible, and would scarcely be believed unless by those who have seen the evil results. The margins of plantations, particularly such as adjoin cultivated land, should likewise be run over, and all Thistles, Docks, and Nettles, cut over before the season of seed-shedding comes on. Thistles, if left too long, will ripen and shed their seeds, even after being cut over, so it is well to bear this in mind, and have them removed before the flowers are fully developed.

**Pruning.**—The summer pruning of young trees is of much importance, and the young plantations should receive the first attention. Rival leading shoots must be cut away, and ungainly side-branches and heavily-foliated branches be cut back somewhat. Lop off all broken branches, dress the wounds neatly, and paint over with gas-tar. Now is a good time to open up views, to lop off overhanging branches from roads and walks, and to prune out dead wood from park trees and shrubs. The too close pruning of all large branches is to be avoided as much as possible, it being better to foreshorten first before the final amputation.

**Barking.**—This should now be all but completed, but the showery nature of the weather during the past six weeks has considerably retarded the harvesting process. Care will be necessary to avoid heating, which means discolouring of the bark, and happy is the forester who is well provided with drying sheds and tarpaulins in a season like this. Prices of the best Oak bark are likely to be low, but that damaged by the weather will not find a ready market.

**Painting and tarring.**—Hurry on during dry and warm weather the tarring of all fences, iron and wood, the painting of field-gates, outbuildings, and tool-houses. Gas-tar is preferable to the tar varnish now commonly in use for such purposes, and may, if too thick for applying with a brush, be thinned down to any consistency by applying a little crude naphtha. In tarring fences a good preliminary step is to have all grass and weeds cut low, particularly around the posts and stays, so that the tar may be applied well down to the ground-level.

**Clearing the falls.**—Where faggots and firewood have not yet been cleared from the falls this should be accomplished with as much speed as possible, else serious damage to the young and tender growth will be well-nigh inevitable. Clear out the branches and firewood first, and after that the heavy timber may be dragged or carted.

Dry weather should, if possible, be chosen in which to drag timber from the woodlands, for if such work is carried on when the roads are soft and gritty, the small stones are apt to adhere to the trees and cause serious annoyance to the sawyer when they are being converted into workable boards and planks.

**Poles.**—The larger branches, as well as crooked poles and tree stems, may be formed into cartloads, these selling readily enough at from 5s. to 7s. 6d. each. All the smaller sprays can be converted into faggots, these being usually formed into two kinds—one for fire-lighting and the other for oven-heating. Small faggots fetch 6s. per hundred, while those of larger size often realise as much as 10s. or 12s. per hundred.

Heavy timber is now at a discount—indeed, certain kinds are hardly saleable at any price. Oak, Ash, and Elm meet with a fairly ready market, and for local purposes they sometimes fetch a pretty remunerative price. The following list will show at a glance the average price per cube foot at present realised for English-grown timber of fair quality and size:—Oak, 1s.; Alder, 1s. 8d.; Ash, 1s. 8d.; Beech, 7d.; Birch, 9d.; Willow, 8d.; Alder, 10s.; Sycamore, 1s. 8d.; (the price of Sycamore timber varies very much with locality); Glean, 1s. 2d.; Chestnut (Spanish), 1s. 8d.; Horse Chestnut, 7d.; Hornbeam, 8d.; Plane, 1s.; Scotch Fir, 7d.; Larch Fir, 1s. 1d.; Austrian and Corsican Pine, 7d.; Yew (if of large size), 1s. 6d.; Cedar, 1s.; Lime, 9d.; Silver Fir, 8d.; Spruce Fir, 7d.; Poplar, 8d.

Local demand frequently affects the price of timber: thus, in boat-building districts, Oak, Elm, and Larch usually find a ready market, and at prices considerably higher than those above quoted. Alder and Birch, where clog-making is considered as an industry, sell very readily at the prices just mentioned, which may also be said of small-sized Sycamores. A. D. Webster, Holwood Park, Kent.

## PLANTS AND THEIR CULTURE.

**PRIMULA SINENSIS.**—The earliest sowings will now be sufficiently advanced to be potted. If the pots used are 60's the compost may be rather finer than if a larger size be used, employing about one-half loam and one-half leaf-mould or sifted rotten manure and sand. Make the plants moderately firm, as if too loose, the soil does not keep in that equable condition of moisture so essential for the well-being of these plants. Do not pot the plants too high, or rotting at the collar will take place, but let the base of the leaves be so far in the soil that for some time no other support is required to keep the plants in position. Primulas like a temperature slightly above that of an ordinary greenhouse. A suitable place is a house or pit with a northern aspect, shaded from the sun only during the brightest part of the day, reducing the air as the sun declines, but always being careful to prevent it becoming stagnant. Damp down the house freely, but avoid wetting the plants.

**Double Primulas.**—These are easily increased by cuttings put in about this time, the old plants having had time to recuperate themselves since flowering, and are now growing afresh, and the cuttings are not so subject to damping off as earlier in the year. Take off healthy crowns, trimming off as few leaves as possible, and taking care that there is a good firm base to the cuttings. Insert them singly in small pots, using a light compost, with a pinch of sharp sand about the cuttings. Secure them to small sticks by gently looping up the leaves. At this season a neatly hotbed, with some moderately moist

material in which to plunge the pots, is a good place in which to strike them.

Succession sowings of seeds should still be made, treating them as recommended at p. 527, April 25. Young seedlings are better pricked off into pans or boxes, as they are then not so much exposed to the varying state of wetness and dryness in the soil.

Old plants kept over from last season, if slightly reduced at the roots, and repotted, make fine specimens by the autumn. I have seen some so treated which were 2 feet over, and loaded with flower. It is better to plant them rather deeply in the pots, and give them a good soaking—afterwards watering sparingly until the pots are filled with roots. F. Ross, Pendell Court, Blitchingley.

## THE FLOWER GARDEN.

**FLOWER BEDS.**—Those that are planted with the usual soft-wooded summer-flowering subjects are filling up rapidly, many of them making such rampant growth as to demand constant attention in regard to pegging down, stopping, thinning-out, and regulating young shoots. Such work is imperative amongst *Verbenas*, *Heliotropes*, *Petunias*, *Gnaphaliums* and similar plants if a high degree of keeping is to be maintained. The beds containing *Perlargoniums*, *Begonias*, *Calceolarias*, &c., should also be looked over at regular intervals, keeping them free from weeds and the plants free from withered flowers, seed-pods and dead leaves. *Iresines*, *Coleus*, *Perilla*, *Abutilons*, and such like plants will require attention, and should have the points of all strong shoots pinched out so as to give them a shapely appearance. *Stachys lanata*, when used as an edging to the beds, should have all flower-stems and misplaced growth cut off, otherwise it will soon become unsightly as an edging plant.

Carpet beds will need constant attention for the next few weeks to maintain them in good order, bearing in mind that to be pleasing they must present a finished appearance. The various lines, panels, or figures of which a design may be composed should be kept as accurately as is practicable. No plants, perhaps, require so much attention as *Mentha*, *Sedums*, *Cerastiums* and *Golden Pyrethrum*; the last named should be kept within bounds by pinching back and not by clipping with hand-shears, as sometimes is the case, but which causes a stubby and unsightly appearance. Few varieties of *Alternantheras* require but little done to them beyond keeping them in line. *Echeverias* are generally considered to be more effective with the flowers taken off, but it is a matter of taste, and had better be treated as such. *Ageratums* and *Iresines* ought to be pegged down to keep them at the same level as other plants growing near them, and the strongest shoots of the last named should be stopped as often as it becomes necessary. *Mesembryanthemums* will need the shoots to be thinned out at times, in addition to the usual regulating and pinching back of leading growths.

**Shrubs.**—Evergreen and deciduous flowering subjects, when the flowers begin to fall, should be pruned; this will consist of shortening back such shoots as have produced flowers, leaving a greater or less length of wood, according to habit. Some plants will also be benefited by a judicious thinning out of the young growths, removing only the weakest and misplaced ones, which will have the effect of admitting more air and light to facilitate the ripening of the wood, without which abundance of flowers cannot be obtained the succeeding year. The present time is also opportune for taking notes with regard to planting and transplanting operations in the autumn.

**Pinks.**—Pipings of these may be put in without further delay, and may be taken off with a bud and cut just below a well ripened joint, cutting off the points of the leaves and putting them under a wet cloth immediately afterwards. Two modes of propagation may be resorted to: they may be inserted firmly in a sandy compost about 2 inches apart under hand-lights on a shady border, or they may be put in boxes or 6-inch pots well drained, and stood in a frame where they can have the assistance of a little bottom-heat as soon as rooted; gradually harden off, when they are struck, preparatory to planting out in beds. The last method I regard as being the better of the two, and if they are kept shaded from bright sunshine and properly attended to in regard to moisture few losses will occur. Propagate in quantity such varieties as *Mrs. Sinkins* and *Anne Boleyn*, these being two varieties most useful for cutting purposes.

**Dahlias.**—These are now making rapid growth, and will require close attention. Cut off weak lateral growths, and in tying up the leaders make due allowance for the stems to swell afterwards. If large blooms are required, it will be a good plan to pinch off all flower-buds that may be appearing at the present time. J. Horsfield, Heytesbury.

## FRUITS UNDER GLASS.

**VINES.**—Early houses from which the crop is cut should be kept cool and well watered, and if red-spider has attacked the foliage, well syringe the vines once a week with petroleum, in the proportion of a wineglassful to four gallons of rain-water heated to a temperature of 85°, and on all other days with clear water only. I once syringed a couple of Black Hamburgh vines with petroleum in the proportion recommended when the fruit was half-coloured. It completely destroyed the spider, but it costed the colouring of the fruit, although it was quite as well flavoured as any other vine which was not so syringed. Houses in which the Grapes are ripe must be kept cool and airy, and if the weather be dull and wet a little warmth may be allowed in the hot-water pipes to prevent stagnation of the air. Muscats and other white Grapes will stand any amount of direct sunshine and be all the better for it; Black Hamburghs, on the other hand, will rapidly lose colour after they have reached maturity, and it is better therefore to afford the vines a light shade. This must, however, not be of such a nature as to darken the house, otherwise much harm will be done to the vines. Gros Colmar and other Grapes which hang during winter should be gone over now the fruit is on the point of colouring and any berries which are too close may be eased by removing some of them. The late rains have lessened the labour of watering outside borders, but borders inside must have strict attention. In regard to watering, guano in small quantities being mixed with the water used with advantage when vines are swelling a heavy crop of fruit. Let a night temperature of 75° to 80° be maintained in houses swelling their crops, and it may be allowed to run up to 90° for a short time after the houses are closed, with abundance of atmospheric moisture, but after 6 p.m. air may be admitted in small quantities by the front ventilators and during the night.

Young vines which are being prepared for fruiting next year should have all the lateral growths pinched to one leaf, and kept to that in the meantime, the excess of sap being allowed to develop growth at the end of the rod. If the vines are very vigorous, two or three of the top buds may break, and when this takes place, these can be allowed to extend to two or three leaves, and then little danger to the future fruit-buds need be apprehended. Young vines which were planted this spring should be making rapid progress, and should be allowed to develop as much growth as there is space to occupy, as the canes will be cut back to the first wire after the foliage has dropped.

Any vines which have not yet been planted may be put in. Choose young plants struck from eyes this season; keep the house well syringed after planting, and good progress can yet be looked for. Such vines will have a decided advantage over others planted next spring.

When it is deemed advisable to renew the borders of any of the vineries after the crop is gathered, preparations should be made by getting the necessary soil and other ingredients mixed, so as to be ready when the work is undertaken. W. M. Baillie, Luton Hoo.

**WEIGELA AMABILIS.**—What a rich legacy of beauty the large amount of sunshine of the last summer left us, as seen in the abundant blossoming of, among other things, our old-fashioned shrubs. An old bush in the York Nurseries of *Weigela amabilis* has been very conspicuous in this respect. The bush has about 100 branches, each bearing twenty-five to thirty trusses of its rosy-pink flowers, with fifteen to twenty blossoms in a truss. Its appearance has been exquisite; the semi-drooping habit adding to its gracefulness of outline. J. S. G. [As a specimen shrub on the lawn when well grown, there are few better. *Deutzia scabra*, which flowers at the same time of the year, and which will grow to 6 feet in height, is an excellent companion to it—the one rose-coloured the other white. Ed.]

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### SHOWS.

MONDAY,	JULY 16	Newcastle-under-Lyne and Nantwich.
TUESDAY,	JULY 17	Leek and Ulverstone.
WEDNESDAY,	JULY 18	Birkenhead.
THURSDAY,	JULY 19	Halesburg, Hammersmith, Northamptonshire, and Salford.
FRIDAY,	JULY 20	National Rose, at Darlington.

#### SALES.

TUESDAY,	JULY 17	Imported and Established Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	JULY 18	The remaining Portion of the Collection of Orchids formed by the late John Day, Esq., also Water Colour Drawings of Orchids, Herbarium Specimens, &c., at Stevens' Rooms.
THURSDAY,	JULY 19	Valuable Established Orchids, from Mr. F. Sander, Orchids in Flower, &c., at Stevens' Rooms.
FRIDAY,	JULY 20	Established Orchids from the Collection of the late H. Littleton Esq., by order of the Executors; Imported Orchids, at Protheroe & Morris' Rooms.

Barren Strawberries.

A SHORT time since we received complaints that a Mulberry tree which usually produced fruits this year covered with male blossoms only. Every year complaints of similar character reach us with reference to Melons, Cucumbers, or some other plant, and, indeed, the facts are so common, and the inferences from them now so generally admitted, that it is a matter of surprise that practical gardeners have not yet discovered the means of so regulating the conditions of growth as to ensure the required fertility of the blossom in a large proportion of the cases. In some instances, indeed, matters are beyond our control, but with forced Strawberries or Melons there ought to be no great difficulty. Had we a properly organised experimental garden, a series of well-considered experiments carried on for two or three seasons would probably suffice to show what we could do and what we could not do, and ensure the grower, to a large extent, against failure.

Some Strawberries naturally bear male blossoms on one plant, female on another (dioecious), and the same plant that bore fruit one year may, under altered conditions, produce male flowers only in another. The original Strawberry, it is assumed, was dioecious, it subsequently developed stamens and pistils in the same flower, as in most of our European varieties, or remained in its dioecious state, as in some of the American sorts. We quote from DARWIN'S *Variation of Animals and Plants*, vol. i., 1868, p. 353, the following summary of facts gleaned by our great naturalist from the horticultural journals of this country and America:—

"Much has been written on the seeds of Strawberries; the true Hautbois properly bears the male and female organs on separate plants, and was con-

sequently named by DUCESNE, dioica; but it frequently produces hermaphrodites; and LINDLEY, by propagating such plants by runners, at the same time destroying the males, soon raised a self prolific stock. The other species often show a tendency towards an imperfect separation of the sexes, as I have noticed with plants forced in a hot-house. Several English varieties, which in this country are free from any such tendency, when cultivated in rich soil under the climate of North America, commonly produce plants with separate sexes; thus a whole acre of Keen's Seedlings in the United States has been observed to be almost sterile from the absence of male flowers; but the more general rule is, that the male plants overrun the female. Some members of the Cincinnati Horticultural Society, especially appointed to investigate this subject, report that 'few varieties had the flowers perfect in both sexual organs,' &c. The most successful cultivators in Ohio plant for every seven rows of 'pistillata,' or female plants, one row of hermaphrodites, which afford pollen for both kinds; but the hermaphrodites, owing to their expenditure in the production of pollen, bear less fruit than the female plants."

There are some physiologists who maintain that these phenomena are indications of a particular inherited tendency or constitution and which is not affected by external conditions, and if so it would not be influenced by any cultural proceedings. To whatsoever extent this may be true, it certainly is not absolutely so. In illustration of this we cite a letter from a well-known Strawberry grower, which we commend to the notice of our readers:—

"Your correspondent on p. 18 touches on a subject just now of special interest, and a few more remarks may be appropriate. One of the chief causes of barrenness in plants is immaturity of crown, consequent on a dry soil, such as we had last season, where the roots are prevented from obtaining the amount of nutriment which is necessary to the production of fruit-buds. This immaturity may be brought about by poverty of soil, and the scarcity of root-fibre which this occasions also materially affects the productive powers of the plant. Again, undue lengthening of the roots in search of food is a source of failure, as food within short reach economises the work of the plant, and maturity is sooner attained. Strawberries especially require liberal mulching, as by means of this a continual growth of surface-root is secured. Transplanting also favours the growth of root, the growing points being broken by removal, fresh ones shoot in greater numbers to take their place, and forming the fibre-roots which are so essential to the production of berries.

"There are some varieties which cannot be induced to form fruit-buds under any circumstances. These probably have a tendency to propagate their kind solely by runners, and the tendency is intensified by the eager horticulturist, who, desirous of securing early and robust plants, neglects those varieties with comparatively few runners, and distributes the former wholesale to his friends forthwith, and may himself even plant a bed of them, only to find out too late their unsuitability. As an instance of productiveness we have Filbert Pine, which, until the fruit crop is gathered, produces no runners, the whole force of the plant seemingly being spent in the production of berries. Where varieties with this character are cultivated, and the fruit buds can be sacrificed, these latter should be taken out before layering the runners, and by this means favouring the growth of the plants. If a variety which may be easily fruited is by drought, poverty of soil, or other causes, prevented from bearing a full crop, or any crop, for a season, there is no reason why the plants should not be brought again into fruitfulness by judicious and careful cultivation; but if they are more than two years old it is preferable generally to make a new bed with runners obtained from trustworthy varieties. One of the best is Vicomtesse

Hericart de Thury, whilst two of the more uncertain bearers are British Queen and Sir Charles Napier. Soil and situation have a great influence on the more delicate kinds of Strawberries, whereas Black Prince or the Vicomtesse are sufficiently hardy to thrive almost anywhere.

"Another cause of barrenness is the layering of runners too late in the season, those layered in September being very open to this fault if not removed very early from the parent plants and from the bed where rooted. If, however, they are transplanted into a well prepared bed they seldom fail to fruit profusely. There are other causes of blindness in the plants such as overcrowding, and the shutting out of light and air by surrounding crops, bushes, and trees. Severe checks to growth, as the breaking and blackening of leaves by the wind, frost, or snow, will lead to failure in Strawberry growing, the plants by such disasters being often so weakened thereby that a full crop of fruit becomes impossible. Most nearly connected with the failures of the present season is the drought of last summer alluded to previously, although other causes may partly be accountable for them. Nearly everything in Strawberry culture depends on the maturing of the crown itself, the result of a healthy leaf and root development, early layering of stock, and this obtained from prolific plants. John Lovel, Driffild."

**THE ROYAL HORTICULTURAL SOCIETY.**—The fortnightly meeting in the Drill Hall on Tuesday was remarkable for the interest, excellence, and variety, of the plants exhibited. Detailed notice is given elsewhere, but we cannot avoid special mention of the noble new Campanula-like plant exhibited from Central Asia by Messrs. VERRCH, a hardy perennial, the worst feature of which, to English growers, will be its name—Ostrowskya. The Kew collection was again most interesting; the same may be said of the illustrations of ornamental trees and shrubs exhibited by Messrs. PAUL & SON and Messrs. VERRCH, of the alpine and herbaceous plants of Messrs. WARE and PAUL, the Delphiniums of Messrs. KELWAY, the Begonias of Messrs. LAING, and others. The interest of these fortnightly meetings, which has always been great, has become more than ever so of late; so that connoisseurs and plant-lovers should make a point of seeing these exhibitions, and of lending their support to the Society.

**COUNCIL MEETING.**—In consequence of the great success of the last Apple and Pear Conferences, and in order to correct and bring up the reports then published to the present date, the Council of the Royal Horticultural Society has decided to hold another Apple and Pear Conference at the gardens at Chiswick, from the 11th to the 18th of October. Anyone desiring information in reference thereto is requested to communicate with Mr. A. F. BARROS, Superintendent of the Royal Horticultural Society's Gardens, Chiswick.

**GARDENERS' ORPHAN FUND.**—Mr. A. F. BARROS, the Hon. Secretary, requests us to state that the paragraph in our last issue, in reference to the Gardeners' Orphan Fund election, is incorrect, and was forwarded to the Press without the authority or knowledge of the committee.

**MR. E. R. CUTLER.**—The friends of this gentleman and the well-wishers to the Gardeners' Royal Benevolent Institution will hear, with regret, of a painful accident which has occurred to their energetic and zealous Secretary. Mr. CUTLER fell in the street a few days since, and has so severely injured his arm that it is feared several weeks must elapse before he can regain the use of it. We are asked to mention the fact, in explanation of any possible delay in conducting the correspondence of the Institution.

**UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The quarterly meeting of this Society was held at the Caledonian Hotel, Robert Street, Adelphi Terrace, Strand, on Monday even-

FIG. 4.—*PINUS SABINIANA*: LEAVES BLUEISH; CONE RICH BROWN. SECTION OF LEAF IN RIGHT-HAND CORNER. (SEE P. 44.)

ing, July 9, Mr. GEORGE WHEELER in the chair. Two new members were elected, making an addition this year of thirty-nine. The membership now stands at 291, including honorary members. The committee is very pleased to state that the Society is in a very healthy condition, no one being on the sick-list at the present time.

**INTERNATIONAL HORTICULTURAL EXHIBITION, COLOGNE.**—We have received from H.B.M. Consul at Düsseldorf additional particulars relating to this exhibition, which will remain open from August 4 to September 9:—

"I have the honour of drawing special attention to this exhibition, which promises to be the most successful one of its class ever held in the Rhinish province—the pearl of the German empire. A better opportunity for promoting the export trade to the Continent in the branches of industry concerned could hardly be afforded—within so easy reach of British ports—elsewhere than at Cologne, one of the most central points of traffic in the most industrial and thickly populated provinces of Germany.

"In the Rhinish Westphalian provinces great progress has been made of late years in the cultivation of gardens and parks on the English system, a taste which is daily being more and more developed with consequent increased requirements.

"In some branches of horticulture Holland and Belgium rank very high, but in most classes of industry connected therewith the English products and manufactures are superior; however, in these days of world-wide competition mere advertisement and issue of circulars no longer suffice; to ensure success the quality must be proved by exhibition wherever and whenever opportunity is afforded.

"The programme in German, (list of chief products and manufactures in English), including no less than 750 kinds of exhibits, is a very comprehensive and extended one, even to which exhibitors are not strictly limited; all classes of products and manufactures in any way, even indirectly connected with horticulture and model farming will with pleasure be received, and every facility will be given for cheap and expeditious transport, suitable mode of exhibition and representation, no charge being made for space. All applications for further information made to the Executive Committee, 'Gartenbau, Ausstellung,' Cologne, will be promptly attended to.

"The departments which would appear to offer the most chances of success to British exhibitors are of vegetables, seeds and their products, and manufactures therefrom, of all classes, but especially grass, Wheat, Oats, and Barley seeds, which are inferior in this country; small pumping engines, worked by steam, water, or gas-power; gearing and appliances connected therewith, for irrigating and syringing, as well as for the extinction of fire purposes.

"Grass-mowing machines, rollers, garden and model-farm water and other carts, implements, weighing machines and tools—in which the Americans are our greatest competitors—garden, park, conservatory, and dwelling-house illuminating lamps and appliances; hot-water, air, and steam heating apparatus; tents, summer-houses, and garden furniture; park phaetons and other vehicles, harness, saddles, and bridles; Bath-chairs, appliances for outdoor games connected with a country gentleman's residence, will also doubtless be admitted.

"Since writing the foregoing, I see, by a supplementary programme, that 21,700 marks (= £1085) have been subscribed for money prizes. T. R. MULVANY, H.B.M. Consul for Westphalia and the Rhinish Provinces, British Consulate, Düsseldorf-on-the-Rhine, June 9, 1888.

**AMERICAN POMOLOGICAL SOCIETY.**—The receipt of this Report year after year makes us feel how sadly behindhand we in this country are in the matter of commercial fruit-culture. It may seem strange to read it, but it seems the fact, that our American cousins understand the virtue of common action and reciprocal counsel better than we do.

They do not dissipate their energies over minor associations, but they weld all in one common federation, to the advantage of all. We observe that our friends across the Atlantic are devoting great attention to Russian Apples. The conditions here are, of course, quite different, nevertheless it may be of use to note that in this climate the Russian Apples have, as a rule, not proved worth growing. The Report contains papers and discussions on fruit and fruit-growing similar to those at our own Fruit Congresses, and a catalogue of the best fruits for each State in the Union. This catalogue is revised at short intervals.

**DISEASED TOMATOS.**—Tomatos, whether in-doors or out-of-doors, are much troubled with disease of various kinds. This season the plagues seem especially virulent. A full description of the diseases caused by the attacks of the Potato fungus, *Peronospora infestans*, on the Tomato, by the black spot (*Phoma*) which forms on the top of the berries, by the *Dactylium* and the *Cladosporium*, have been given in our columns, with illustrations, by Mr. PROWRIGHT and Mr. WORTHINGTON SMITH. We must refer our readers to our numbers for November 12, 1881; August 6, and October 1 and 20, 1887, for full details as to the nature of these several diseases. Unfortunately a knowledge of the remedial measures to be adopted has not kept pace with our knowledge of the diseases themselves. Experts have told us to what fungi the diseases are due, but they have not hitherto been able to suggest a remedy. This is in large measure due to the fact that the fungi in question are chiefly of internal growth, and no remedy applied externally can be expected to be efficacious. The consequences, however, are so serious, that it behoves practical men, now that they are made acquainted with the nature of the foe they have to contend with, not to be satisfied with mere "stamping out" by destroying affected plants, replanting in fresh soil, and the like—procedures often very imperfectly carried out—but to avail themselves also of known fungicides or fungus-destroyers, such as bisulphide of carbon, sulphur or sulphide of potassium. In particular we would recommend the use of sulphate of copper mixed with lime, in the manner and in the proportions mentioned in a recent article (see p. 15). It is possible that by such measures the disease may be controlled; at any rate, trial should be made. It is in such cases as these that the need of experimental gardens and laboratories becomes evident. Private growers have rarely the leisure or the competence to undertake the necessary experiments. The Ministry of Agriculture which it is proposed to establish might most appropriately signalise its inauguration by the establishment of institutions of this kind, the cost of which would ultimately be repaid a hundredfold by the benefits conferred. As it is, one set of men give freely their time, their labour, and their brains to the investigation of these diseases, and the practical men, so-called, instead of availing themselves of the information furnished them, do nothing but grumble and go on as before. It is time a new departure was made.

**A PICTURECOLOURED IRIS.**—We have had occasion to figure Calanthe and other hybrid flowers in which the colour has been distributed unevenly, but we have not before witnessed a similar occurrence in any Iris. Mr. KRELLAGE has now obligingly sent us a flower of the so-called English Iris, "Max Roose's." Under ordinary circumstances this flower is of a deep rich velvety-purple, with a central blotch of yellow and a spotted midrib to each of the sepals or "falls." In the flower in question one of the falls has a pale lilac ground, with a few deep violet blotches radiating from the broad midrib. Two of the petals or standards are of their normal purple colour, while the third is purple on one side of the centre, pale lilac striped with violet on the other. We do not know the parentage of this particular Iris, but it is reasonable to suppose that this peculiar distribution of colour may be the result of a tendency to separate the heretofore blended elements, and to revert to the condition of one or other parent. A second flower on the same spike, which opened in water, was quite normal. Mr. KRELLAGE tells us he has observed similar variation in Iris Victor Verdier.

**HARDY AZALEAS.**—We have received from Mr. ANTHONY WATERER, Woking, cut specimens of these, and very fine they were too. The colours are bright and varied, and the bloom of good size. Specimens

of these plants, and also of Rhododendrons, from Mr. A. WATERER, formed a feature at the recent evening *fête* of the Royal Botanic Society, one tent being full of them.

**POISONING BY MISCHANCE.**—A fatal accident has occurred at Monmouth in consequence of a workman drinking, by mistake, a quantity of some fluid used to kill weeds, and which he obtained from a barrel. The barrel was properly labelled, but it seems from the report before us to open the question whether or no all barrels containing poisonous matters should not be of a particular shape, so as to avoid the mischance of mistaking a barrel of poison for one of beer or cider. No blame attached to the master.

## PINUS SABINIANA.\*

For the opportunity of figuring the cone of this noble species we are indebted to M. Naudin, of Antibes. The botanical history of the tree is pretty well known, so that we need not say much upon that point. It was introduced from California by Douglas in 1832. In cultivation in this country the tree forms a rounded or oblong head, with long, loosely set branches upturned at the ends, so that the light penetrates freely, while the very long, pendulous, grey leaves, waving with every gust of wind, give a peculiarly distinct look to the tree. The old bark is reddish-brown, or smoky, according to the locality in which the tree is growing; the younger bark is glaucous, or bluish-grey; the young shoots destitute of leaves except at the tips, but covered more or less with the marks of the bud-scales, which, when recent, are reflexed, membranous, lanceolate, fringed at the edges. The buds are cylindric, reddish-brown, and covered with resin; they begin to shoot early in spring, the terminal bud starting into growth before the lateral ones.

The leaves are very long, triangular in section, with the dorsal surface convex, the others concave. There is a very thick layer of hypoderm, or thick woody cells which contribute to the strength of the leaves, and which are only interrupted by the numerous breathing pores or stomata. Within this is the green substance of the leaf, traversed by two or more resin-canals, and in the centre is a double fibro-vascular bundle, surrounded by an elliptical endoderm or bundle sheath of a single row of elliptical cells, as shown magnified in our illustration (fig. 4). The male flowers are yellow, in oblong clusters, while the appearance and size of the noble rich brown cones is sufficiently shown in our illustration. The tree is quite hardy—not very particular as to soil—but should be planted in a sheltered situation. The seedlings produce a relatively large tap-root, which renders them rather difficult to transplant.

In this country *P. Sabiniana* can only be regarded as an ornamental tree, as the growth is slow and the wood soft.

Our notes have been taken principally from the trees at Kew and at Pampesford.

In the Sierra Nevada this Pine is known as the Nut Pine, owing to the agreeable flavour of the seeds, which are collected by the natives for food.

Mr. Muir, in an article in *Harper's Magazine*, on the coniferous forests of the Sierra Nevada, gives the following account of this tree, which for its interest is worth transcribing:—

"The first coniferous tree met by the traveller in ascending the range from the west is the Nut Pine, remarkable for its loose, airy, tropical appearance, suggesting a region of Palms rather than cool resinous Pine woods. No one would take it at first sight to be a Pine or Conifer of any kind, it is so loose in habit and widely branched, and its foliage is so thin and grey. Full-grown specimens are from 40 to 50 feet in height and from 2 to 3 feet in diameter. At a height of 15 or 20 feet from the ground, the trunk usually divides into three or four main branches, about equal in size, which, after bearing away from one another, shoot straight up, and form separate summits; while the crooked

\* *Pinus Sabiniana*, Douglas. See especially Engelmann, in *Botany of California*, ii., p. 121.

subordinate branches aspire, or radiate, or droop in loose ornamental sprays. The slender, greyish-green needles are from 8 to 12 inches long, loosely tasselled, and incline to droop in handsome curves, contrasting with the stiff, dark-coloured trunk and branches in a very striking manner. No other tree of my acquaintance, so substantial in body, is, in its body so thin and so pensive to light. The sunbeams sit through even the leafiest trees, with scarce any interruption, and the weary, heated traveller finds but little protection in the shade. It grows only on the torrid foot-hills, seeming to delight in the most ardent sunheat, like a Palm, springing up here and there singly, or in scattered groups of five or six, among scrubby white Oaks and thickets of *Ceanothus* and *Manganita*: its extreme upper limit being about 4000 feet above the sea, its lower about from 500 to 800 feet. The generous crop of sweet nutritious nuts [seeds] which it yields makes it a great favourite with Indians and with bears. The cones are truly magnificent, measuring 5 to 8 inches in length, and not much less in thickness; rich chocolate-brown in colour, and protected by strong, downward-curving hooks, which terminate in scales. Nevertheless, the little Douglas squirrel can open them.

"Indians gathering the ripe nuts make a striking picture. The men climb the trees like bears and beat off the cones with sticks, or recklessly cut off the more fruitful branches with hatchets, while the squaws gather them in heaps, and roast them until the scales open sufficiently to allow the hard-shelled seeds to be beaten out. Then, in the cool evenings, men, women, and children, with their capacity for dirt greatly increased by the soft resin with which they are all bedraggled, form circles around the camp fires on the bank of some stream, and lie in easy independence, cracking nuts, and laughing and chattering, as heedless of the future as bears and squirrels."

## ENTOMOLOGY.

### THE PEAR MIDGE.

The extraordinary meteorological conditions of the last, and the commencement of the present, year effected the production of a splendid amount of bloom on our fruit trees, especially on the *Beurré Clairgeau* Pears, which were literally covered with sheets of blossoms. But notwithstanding the great cold which afterwards cut off the wall-fruit blooms before they had time to set the fruit, the insects which attack the Apples and Pears in the youngest state of the leaves and fruit were most abundant, especially the leaf-rolling caterpillars of the small moths of the family *Tortricidae* and the gall-midges and sawflies, the larvae of which live in the heart of the young fruit.

The history of a small species of midge, parasitic on Pears, was first investigated by Joseph Schmidberger, Canon of St. Floriac, in a report made to the Imperial Agricultural Society of Vienna, which was embodied by M. Kollar, the head of the Natural History Museum of Vienna, in his "Treatise on Insects Injurious to Gardeners, Foresters, and Farmers," (Vienna, May, 1837), translated by J. and M., Loudon (with notes by the present writer, and published by W. Smith, London, 1840, in 12mo). Schmidberger considered his insects to be identical with the *Cecidomyia nigra* of Mergen, "because the description which Mergen gives of the black gall-midge completely agrees with them." More recent writers on the Diptera have doubted the correctness of this identification, and Dr. Riley has given the name of *Cecidomyia (Diplosis) pyrivora* to the Pear midge.

It was in the winter of 1831 that the insects first appeared in the perfect winged state, and by February 15 more than a hundred had appeared in the Canon's glasses, from pupae placed there in the previous autumn. He says, "When the blossom-buds of the Pear tree were so far developed that in the single blossoms a petal showed itself between the segments of the calyx, I found the first midge in the act of laying the egg on the blossom, on April 12. It had fixed itself almost perpendicularly on the middle of a single blossom, and having pierced the petal through with its long ovipositor, it laid its

eggs on the anther of the still closed blossom. On cutting the pierced bud open the eggs were found lying in a heap one upon another on the anthers—from ten to twelve and even twenty in number. The midges ceased appearing in the garden and laying their eggs as late as April 18. On the fourth day after oviposition the small larvae were found on the embryo of the blossom, into which they began to bore, usually in or near the stem of the calyx; they then descend to the core, when they begin to devour the fruit on all sides. When they have attained their full size, and consumed the pulp of the young fruit, they make their way out, and as soon as they get to the surface of the now hollow little Pear, they bend themselves into a flattened ring, and, by suddenly straightening the body, they make a spring of several inches and fall to the ground to bury themselves. Generally, however, they remain within the Pear till it falls, which it is

FIG. 5.—THE PEAR-MIDGE.

ready to do by its continued want of growth, when they escape by cracks in the skin, and enter the earth, being fully grown by the middle of May; it is not, however, until the middle of December and January that they assume the winged state from the pupa, and it is only in the following spring that they creep out of the ground and propagate their species in the open air."

For many years past we have received communications from our correspondents concerning this Pear midge. In 1855, and again in 1883, it was very abundant, the larvae remaining in that state even until the end of June. With the view of clearing up the question of its history and nomenclature, as well as that of another Pear insect described by Nördlinger, in *Die Kleinen Feinde*, in 1869, under the name of *Cecidomyia pyricola*, the natural history of the true Pear midge has formed the subject of investigation by Professor Mik, of Vienna; Dr. Riley, the celebrated American State entomologist, (whose description with figures appears in the

*American Report of the Entomologist*, published at Washington in 1886); Miss Ormerod (*Report of Observations of Injurious Insects for 1884*), Mr. Inchbald, whose memoir appeared in the *Entomologist* for February, 1887, to whom the present writer is indebted for specimens of the perfect insect, and especially to Dr. R. H. Meade, who has just published a careful and elaborate article in the last-named periodical.

The insect belongs to the subgenus *Diplosis* of Loew (one of the sections of the extensive genus *Cecidomyia*); it measures from 2 to 3 millimetres in length, the female being rather larger than the male. It is of a dark ashy-black colour, with pale hairs, the thorax with three broad black lines, and rows of yellowish hairs. The antennae of the males are twenty-six jointed, and those of the female are fourteen-jointed, including two very short basal joints closely soldered together. The abdomen is blackish, with narrow paler cross-bands. The wings are pale ashy, with long fringe of fine hairs; and the legs are brown, with paler-coloured hairs.

Our woodcut (fig. 5) represents—1, a young Pear cut open, showing the hollow made by the five enclosed larvae; 2, the larva of the natural size; 3, the same magnified; 4, the same preparing to leap; 5, the male midge, the natural size indicated by the small cross lines, the jointed process at the right side of the antennae, representing one of the palpi; 6, five of the terminal joints of the male antenna; 7, apex of the wing, showing the thickened margin continued into the extremity of the main vein of the wing; 8, three of the middle joints of the female antennae; 9, the elongated telescope-like ovipositor of the female. I. O. Westwood.

## SCOTLAND.

### THE SEED AND NURSERY TRADE ASSOCIATION AND NON-WARRANTY.

ABOUT twenty-five of the members of the above Association met in the Waterloo Hotel on the 4th inst., as was arranged at the annual meeting held last month to further consider the attitude that should be adopted by the trade towards the non-warranty clause, and towards those who use it in transacting their business. Mr. Watt (of Messrs. Little & Ballantyne, Carlisle), presided, and in reply to Mr. Mather, Kelso, said that his firm had never used the non-warranty clause in their retail business but gave a special guarantee. They used a non-warranty clause in their wholesale business, but having no sympathy with the principle it was their intention to withdraw or regulate it according to the resolution of that or some future meeting. The large London firms seemed determined to stand by the clause, and he suggested that subscriptions should be raised throughout the trade to carry the case of Messrs. Smith & Son, Aberdeen, to the House of Lords, and endeavour to obtain a reversal of the decision of the First Division of the Court of Session. The retail merchants were placed in an awkward position in being obliged to buy without any warranty while they were held responsible to the farmers for the kind and quality of the seeds they sold. The fact that he presided at the former meeting of the trade and again that day showed that he did not approve of the clause as adopted by the London wholesale merchants. Having read a letter from Mr. Tait, of Manchester, President of the Seed and Nursery Trade Association, in which he offered a subscription of £10 towards the expense of an appeal in Messrs. Smith's case, the Chairman said his firm would contribute a similar amount.

Mr. James Elder, Haddington, inquired what position they would be in as a trade in the event of the case being lost in the House of Lords?

In reply, the Chairman said there was an impression abroad that the decision of the Court of Session was not in accordance with moral law, and that a different judgment might be given in the House of Lords. Most of those in the trade with whom he

had spoken thought it unreasonable that a seller should have the power to forward an article different from that ordered, and that the buyer should be compelled to accept it simply because the non-warranty clause was printed on the top of the invoice. As to the question of remedy, he was not in favour of a union; his idea was that the President of the Board of Trade should be approached with the view of getting a clause inserted in the Mercantile Law Amendment Act, making it illegal for seedsmen to contract themselves out of liability by a non-warranty clause.

Mr. Robson (Messrs. Smith & Son, Aberdeen), said his firm had not lost faith in their case, and that in the event of their being supported in carrying an appeal to the House of Lords they would give a substantial subscription towards it. He confessed to their having used the clause themselves, but they had come to recognise it as bad. He advised the formation of an association of all seed growers and merchants who disapproved of the clause, and who would refuse to deal with merchants adopting it. In putting themselves entirely in the hands of those who used the clause they were liable to get any one kind of seed for any other kind. They might not only get Rape for Turnip, but perhaps Cucumber for Carrot.

Mr. T. B. Park, Haddington, moved:—"That a strong recommendation be made to all the trade to buy from those merchants only who do not use the clause." He had, he said, faith in the honesty of the trade, and he believed that if a wholesale seedsmen came manfully forward and abolished the non-warranty clause he would get the support of the trade.

Mr. Ireland (Messrs. Ireland & Thomson, Edinburgh) seconded; while Mr. Davie, Haddington, said, that as he was bound to purchase under the non-warranty clause he could not sell under any other conditions. He sympathised, however, with Messrs. Smith & Son, and thought the trade should assist them in their appeal. To that end he would be glad to contribute, and meantime he moved:—"That it be remitted to a committee to consult the whole trade on the question of raising a fund to carry forward the appeal." Mr. Carter, Berwick, seconded.

Mr. Robson did not think a recommendation such as was proposed in the motion would be of any use. Unless there was to be a combination among the retail dealers no attention would be paid to the recommendation. He moved as an amendment—"That an association be at once formed of all seed growers and merchants who disapprove of the non-warranty clause now used by many wholesale and retail firms, and who should agree not to recognise the said clause in any of their business dealings." Mr. Taylor Dalkeith believed something stronger than was contained in the motion was required, and he, therefore, seconded the amendment. Mr. Mather supported the motion, believing that it would be impossible to carry out the combination proposed. Mr. Park concurred with the last speaker, and said his belief was that if the motion were adopted they would get such support from the trade as would influence the wholesale merchants to withdraw the obnoxious clause. Mr. Cross, Leith, suggested that those present should sign the circular embodying the recommendation to the trade, and Mr. Robson said if the meeting agreed to that he would withdraw his amendment. The Chairman said he could not consent to sign such a document. It would be, he considered, boycotting the members of the wholesale trade, and would place retail merchants in such a position as to appear incompetent to manage their own business. He was prepared to say that under ordinary circumstances he would not deal with any member of the wholesale trade who adopted the clause, and that he would not adopt that clause himself, but beyond that he could not go. On its being suggested that the terms of the motion should be altered so as to apply to the purchase of "root seeds" only the Chairman signified his willingness to sign the circular so amended. In that form the motion was unanimously agreed to. To the Secretary (Mr.

David Hunter, S.S.C.) was remitted the question of raising a fund to assist Messrs. Smith & Son to carry their appeal to the House of Lords, with instructions to duly report progress to his Association. The proceedings terminated with a vote of thanks to the Chairman.

#### THE SCOTTISH HORTICULTURAL ASSOCIATION.

The ordinary monthly meeting of this Association was held in 5, St. Andrew Square on the 3rd inst.; Mr. Robert Morison first, and Mr. Alex. Milne subsequently, occupied the Chair. A paper was read by Mr. Bell, gardener, Morton Hall, on the Tomato. The history and botanical relationship of the plant were sketched. A native of South America, it was introduced in 1596, and was long cultivated in this country merely for the ornamental character of its fruit. Only of late years had its merits as an esculent been recognised in Britain, but so rapidly had it increased in favour that it is now an almost universal article of diet, and an important commercial product. Comparing the two classes of Tomatoes, viz., those with smooth and those with corrugated fruit, the writer said the latter were perhaps the heaviest croppers, and were consequently more largely grown by those who catered for market, but the former had a better appearance, brought better prices, and were most in favour for the purpose of competition. It was questionable whether the yellow-fruited sorts would ever obtain the same amount of favour as the red-fruited, though some contended that they were superior in quality and flavour to the latter. The cultural instructions were thoroughly practical and excellent. In the discussion that followed, the point as to whether the Tomato is a vegetable or a fruit was raised. It was pointed out by one member that it had been exhibited in collections of fruit at recent flower shows, and by others that it was frequently served up at dessert, but members were pretty equally divided as to the propriety of placing it in the category of dessert fruits.

Mr. Alexander Mackenzie, Warriston Nursery, read a paper by Mr. Hugh Gorrie, gardener, Mauldslee Castle, on "Select Stove Plants," which contained an excellent enumeration of foliage and flowering stove plants, with notes on their culture. Both writers were warmly thanked for their communications.

Amongst the exhibits a handsome Strawberry, sent in by Mr. John Fraser, station-master, Annan, Dumfriesshire, received a First-class Certificate. It is said to be a cross between Dr. Hogg and Black Prince. Its chief merits are earliness, having been ripened in Annan on June 18, even in such a late season as this; good size, being intermediate between both parents; excellent flavour and solid flesh, bespeaking good carrying qualities. It is named John Ruskin. Mr. Charles Buchanan, Pennycook House, exhibited a spray of Bougainvillea glabra, 3 feet long, the superb colour of which was much commented upon, along with the fact that it was grown and flowered in a Camellia-house.

Other exhibits were Cattleya Harrisiana (?), which looked like C. Mendeli, from Mr. Grant, St. Leonard's Hill, Dunfermline; seedling Pansies and decorative Pelargoniums, from Messrs. R. B. Laird & Sons; Saxifraga cotyledon, with a spike 3 feet long, from Mr. Henderson, of Clermiston; and branches of *Colletia horrida* and cruciata from the open air, by Mr. Hugh Fraser, Leith Walk Nurseries.

## HOME CORRESPONDENCE.

**CREEPERS ON A HOUSE.**—The southern front of my house is covered with a dense mass of ivy, *Ampelopsis Veitchii*, *Gloire de Dijon* Rose, *Clematis montana*, *C. azurea*, *C. Jackmanni*, and the variegated *Lonicera brachyphylla*, besides half-a-dozen creepers of less rampant growth. Every year by about mid-summer the mass of branches and foliage becomes an unmanageable wilderness. The young shoots cling to the woodwork of the windows, get behind the spongs and lift the slates, and hang down in long matted bundles that have a most untidy appearance. I should be grateful for advice as to the best way of dealing with them. The most troublesome are *Clematis azurea*, whose long slender sprays cling to each other and refuse to be fastened up without an

amount of trouble and time which cannot be given to them; and *C. montana*, whose huge snake-like stems have become white and bare, and a large part of whose flowering sprays are obliged to be cut off in the late summer because nothing else can be done with them. If *C. montana* were cut down to within 6 feet of the ground and all its overgrown top pulled out and cleared away, would it shoot out afresh? But my chief despair is *C. azurea*. If I cut away the unruly growths I get no flowers next year. If I leave them alone they soon shut out the light from the windows. If I tie them up in masses they crush and break, and to separate and nail them up is impracticable. F. T. M.

**MELON GROWING.**—At Orwell Park Garden, Mr. Wallis, Col. Tomline's gardener, adopts a capital plan of utilising all space over the path at the back of the Pine-stoves, which he covers with Melons during the summer, and gets a double lot to ripen as directly one batch is over he at once puts fresh plants in, and thus keeps up a regular succession. These are grown in *Seakale* or bottomless pots, which are stood or plunged on or in the leaf-bed between the Pines, and the pots are filled with strong turfy loam, and when the fruit is set, liberal supplies of liquid manure are given, and plenty of tepid water when required, to help it to swell. The plants are run up with clean single stems, some 3 or 4 feet, and are then trained on temporary trellises made of laths of wood, and the fruit is supported by pieces of square board slung up, or Raffia-grass run round and tied. As the roots of the Melons can get through into the leaf-bed, the half-bushel or so of soil the plants have suffices for them to carry three fruits on each, and these being so fully exposed to light and air, are always well finished and of good flavour. In pits and frames Melons follow the Strawberries and Potatoes with no other preparation than soil from the kitchen garden quarters being put in; and the thick leathery foliage the plants have, and the number of Melons fast swelling, show plainly what may be done without spending time and labour in making up hotbeds. J. S.

**CHELSEA GEM PEA.**—This variety, which was sent out by Messrs. James Veitch & Sons, is a valuable acquisition as an early Pea, and is one of the earliest, if not the earliest, of all. It was ready for gathering out-of-doors here ten days before any other early Pea. It is an amateur's Pea, and suitable for small gardens, as it is not only very productive and of good quality, but is only 12 inches in height, of branching habit and requires no sticks. The pods are well filled with large, well flavoured Peas, and it only wants to be known to be appreciated. W. Gallop, Bradford Peverell.

**GREAT PROMISE OF STRAWBERRIES.**—I hear many complaints of Strawberries being a non-success this year. I planted 1500 last autumn, and every plant is in good condition as regards foliage and fruit. I picked for the first time on June 24, King of the Earlies. It was fit to gather, and has been followed by Laxton's Noble; and the new Strawberry Waterloo, and several other leading varieties are setting their flowers well. The plants had a good mulching of manure after being planted, and the beds were well watered throughout the dry time afterwards. The fruits are thinned to six on a plant. G. Humphreys, Streatham.

**WHITE PINKS.**—These are among the most valuable of white flowers for cutting, as, besides their purity and adaptability for bouquet work, and the dressing of vases or glasses, their perfume is very agreeable, and for a long time they have been general favourites in gardens. A few years ago a new one, under the name of Mrs. Sinkins, made its appearance, and a fine thing it is, and when it was first introduced it bid fair to drive the old-fashioned one out of cultivation; but as this is at least a fortnight earlier in bloom it still holds its own, and is likely to do so for some time yet to come. The best example of this last-named Pink I have ever seen are at Orwell Park, where Mr. Wallis has large beds of it, in such vigour and colour of foliage that one could hardly believe the plants to be those of the old double white without his assurance that they were that variety, as, besides the great strength and rich metallic hue of the "grass," they have stout sturdy stems a foot or so high, and big pink flowers to match. The soil these plants are growing in is a very stiff loam, which not only suits them but Carnations also, as large numbers of these are in the same gardens, and look equally healthy and vigorous.

As to Mrs. Sinkins Pink, it is invaluable to form a succession of the borders; for besides coming on just after the other and blooming in a mass with almost equal freedom, it produces a few flowers nearly the whole summer through. For pot culture none other equals it, but to have plants strong and fit for forcing they should be propagated early, and as soon as struck hardened off, and then planted out in the open. By the end of September they will have made good growth, and may then be lifted and potted in 32-sized pots, after which they should be plunged in cold frames, with their heads well up to the glass, and have air whenever the weather is favourable. J. S.

**LETUCES.**—Every one who has to keep up a supply of Lettuces during the summer and autumn months knows how difficult it is to grow them without having them bolt if they are transplanted, and especially is this so if the weather at the time of their removal happens to be dry and unfavourable, but this tendency to run may easily be checked, and in most cases prevented, by sowing the seed where the plants are to stand, which is a far better plan than raising them in beds, for, however carefully they may be lifted the tap-roots must of necessity be broken, and this check causes the evil referred to. A good way of treating Lettuce at this season of the year is to make provision for them between rows of Celery, which should be done by spreading a thin layer of quite rotten manure on the surface of the ground, between the trenches, before they are dug out, and the soil that comes from them then laid on the top. As soon as the Celery is planted the next thing is to flatten and make level the land between, by raking, and as soon as this is done a shallow drill down the centre should be drawn and the seed dotted in thinly, in patches a foot apart, or sown in the ordinary way and then covered, but previous to the sowing, it is sometimes advisable to sprinkle or water the drill row, which, in dry, hot weather assists greatly in the germination of the seed. Another good situation for summer Lettuce is a north or other partially shaded border, where they can be kept cool, but others that come on later cannot well be too much exposed. What they do like is a deep rich piece of soil, and with the tap-roots intact, if they can get that they will take care of themselves. One of the best to grow at this season of the year is the old Paris White Cos, and for the autumn, winter, and spring none equal the Bath Brown and Hicks', both of which are crisp and of excellent flavour. These two will stand any ordinary amount of frost, if they have a favourable position—the best for those to remain through the winter and yield the first supply being under the foot of a south wall, or on a sloping border having the same aspect, where they may be planted a foot or so apart, in rows of a like distance asunder. J. S.

**THE STORM IN SOUTH LINCOLNSHIRE.**—A terrible thunderstorm passed over this neighbourhood on Thursday, the 5th inst.; the rain and hail poured down in torrents, and it is some years since we witnessed such a storm. The lightning was very vivid, and was followed almost immediately by heavy peals of thunder. A man who was drilling Turnips in a field was killed on the spot with the horse he was driving; a lad who was with the drill was injured, and several sheep in the field were killed. In the pleasure grounds of Bloxholm Hall several trees were struck, one a very fine *Pinus austriaca*, about 52 feet high, was struck, the lightning passing from top to bottom, taking off a strip of bark the whole length of the stem. One Oak, one Ash, and some Elms were struck in the same way. Sad havoc has been made by the hail in the flower garden, and in the kitchen garden Peas, Marrows, Spinach, Onions, French and Runner Beans were very much injured by the hailstones, which were large, and fell to the depth of an inch. Rain and hail fell, as measured by the rain-gauge, to the depth of 1½ inch in forty minutes from 12 noon to twenty minutes to 1 o'clock. The storm was confined to two parishes—Bloxholm and Ashby. David Lumsden.

**BROCCOLI, GILBERT'S VICTORIA.**—I have been expecting to see some further remarks respecting this Broccoli from your correspondent Mr. H. Markham, who, writing in the *Gardeners' Chronicle*, June 9, p. 729, refers to this variety as looking very promising. If I may judge from the way in which it has behaved with me, I feel sure that it has fully borne out that promise, and that Mr. Markham is well pleased with it. I have grown every variety of Broccoli which has been sent out within these last ten years (as well

as older ones), but the variety in question is by far the best of them all. The flavour is remarkably mild. It is also very hardy, thoroughly protecting, and very late. I cut the last heads on June 21. It also has another excellent property, viz., the leaves do not spread out like other kinds, but grow close together and nearly upright, consequently it can be planted much closer together than other varieties. I might mention that our soil is very light and near the rock, this perhaps suits the above variety better than the others. J. H.

**NARCISSUS POETICUS GOING BLIND.**—I am of opinion that the blindness of flowers of *Narcissus poeticus* is brought about through cold and late frost, as we had many here this season so affected, and I know a grower who has plants on an exposed piece of heavy land where they seldom open a bloom, and he has others on warm light soil where they expand fully and freely, and give him a good supply for the market. What this *Narcissus* appears to require is a sheltered position, backed up by shrubs, in a border, and in place of this kind near here I saw a row this spring with hundreds of blooms, which shows what a little protection will do for the plants. The earthing up around the leaves, or burying deeper, may be the means of retarding growth and flowering, and thus save the bloom, but the same thing may, I think, be done by sticking a few pieces of Laurel or other evergreen closely around or among the beds and rows, just before the flower-heads emerge from the foliage. J. S.

## SOCIETIES.

### NATIONAL ROSE.

**JULY 7.**—The National Rose Society held this season's exhibition at its former home—the Crystal Palace. A large attendance of visitors made it very difficult to see the fine beauty of the display, which was of a uniformly high character—dark coloured Roses being best shown, the lighter sorts having apparently suffered from the recent heavy rains.

**Nurserymen's Division.**—In the leading class for seventy-two distinct, single trusses, Mr. F. Cant, Colchester, took the 1st prize and trophy with an excellent collection of large, bright, clean flowers, in a close competition. The most conspicuous blooms were *Pride of Waltham*, *Alphonse Soupet*, *Madame Bravy*, *Maréchal Niel*, *Annie Laxton*, *Ulrich Brunner*, *Madame de Watteville*, *T. Mills*, *Victor Hugo*, *La France*, *Crown Prince*, *Captain Christy*, *Her Majesty*, *General Jacqueminot*, *Merveille de Lyon*, *Baroness Rothschild*, and *Madame Gabrielle Luizet*. Messrs. Paul & Son, Cheshunt, were accorded 2nd, and followed very closely with *General Jacqueminot*, *Madame C. Wood*, *Her Majesty*, *Mrs. J. Laing*, *Ulrich Brunner*, *Paul Nelson*, *François Michelon*, *Duke of Teck*, *La France*, *Navy Officer*, *Oliver*, *Niphetos*, as the finest; Mr. B. R. Cant, Colchester, came 3rd; and M. J. Cranston & Co., Hereford, were 4th, each having first-class blooms. The Silver Medal for the best I.P. in the show (nurserymen's division) was awarded to the last-named firm for a specimen of *Etienne Levett* shown in this class.

In the competition for forty-eight triplets, Mr. B. R. Cant led with a varied collection, finely grown, in which were *General Jacqueminot*, *Baroness Rothschild*, *Sultan of Zanzibar*, *Catherine Mermet*, *Prince Camille de Rohan*, *Marie Van Houtte*, *Ulrich Brunner*, *A. K. Williams*, *Souvenir d'un Ami*, *Thomas Mills*, *Mrs. Baumann*, *Madame Ducher*, and *Marie Verdier*. Messrs. Paul & Son, Cheshunt, were again 2nd, with slightly smaller blooms, *General Jacqueminot*, *François Levett*, *A. K. Williams*, *Duke of Edinburgh*, *Merveille de Lyon*, *Camille Bernardin*, and *Mrs. J. Laing* being well represented. And of almost the same varieties was the lot from Mr. F. Cant, which took the 3rd prize. Mr. C. Turner, with capital *Merveille de Lyon* and *Viscountess Folkestone*, taking 4th.

In the forty-eight singles, Mr. F. W. Rumsey, Waltham Cross, N., showed one of the finest stands in the show, carrying off 1st honours against Messrs. J. Jefferies & Son, of Cirencester. In the 1st prize lot a number of specially good blooms—*Etienne Levett*, *Heinrich Schultheis*, *Madame Verdier*, *A. K. Williams*, *Alfred Colomb*, *Lord F. Cavendish*, *General Jacqueminot*, *Le Havre*, and *Ulrich Brunner*, being worthy of particular note. Messrs. Jefferies' blooms were not quite so bright, *Louis Van Houtte*, *Duke*

of Albany, *Merveille de Lyon*, *Etoile de Lyon*, being good. The 3rd prize went to Messrs. G. Cooling & Sons, Bath, for a neat and clean stand, comprising *Merveille de Lyon*, *Madame Lambert*, *Annie Olivier*, *Madame Clemence Joigneux*, *Madame Charles Wood*, and *Marie Finger*.

Messrs. G. & W. H. Birch, Peterborough, showed the best thirty-four distinct, of fair quality and size, *Heinrich Schultheis*, *Niphetos*, *Ulrich Brunner*, and *Countess of Oxford*, being their best. Mr. Mount, Canterbury, came a close 2nd with *Maréchal Niel*, *Ulrich Brunner*, *Catherine Mermet*, and *Marie Raby*; the 3rd place being accorded to Mr. J. House, Peterborough, showing popular varieties.

For twenty-four varieties, in triplets, the place of honour was assigned to Mr. G. Prince, Oxford, whose blooms were very satisfactory in all respects, *Comtesse de Nadailac*, *Madame G. Luizet*, *Anna Olivier*, *Marie Van Houtte*, *Duke of Edinburgh*, and *Merveille de Lyon* being represented by finely formed examples.

Messrs. Jefferies and Messrs. Cooling were respectively 3rd and 4th, each showing well; in the former stand *François Michelon*, *Rubens* and *Madame Lambert* were best, and in the latter *Magna Charta* and *Madame G. Luizet*.

In the Tea and Noisette division the nurserymen were showing well, and competition again ran close. For twenty-four distinct singles Mr. Prince showed a very high-class lot of blooms, finely coloured and bright, and was awarded 1st, *Jules Finger*, *Comtesse de Nadailac*, *Souvenir de S. A. Prince*, a white sport from *Souvenir d'un Ami*, and *Madame Lambert* being the most conspicuous; Mr. B. R. Cant, 2nd, with *Mrs. Welch*, *The Bride*, and *Anna Olivier* in fine form; 3rd, Mr. F. Cant (all Teas), *Madame Cusin* being well represented.

Mr. J. Mattock, Oxford, was 1st in the minor class for eighteen distinct, showing splendid blooms of *Madame Lambert*, *Edith Gifford*, and *Jean Ducher*, to which last the Silver Medal for the best Tea or Noisette (nurserymen's section) was awarded.

Mr. Prince showed the best twelve of any Tea or Noisette with *Hon. Edmond*, *Edmund* in fine condition; 2nd, Mr. C. Turner with richly coloured *Catherine Mermet*. The competition here was large.

Mr. Prince had the best eighteen Teas or Noisettes, staging a grand lot, in which *Comtesse de Nadailac*, *Anna Olivier*, *Alba rosea*, *Madame Cusin*, *Madame Lambert*, and *Jules Finger* were prominent flowers. Mr. F. Cant was 2nd, showing *Rubens*, *Madame Cusin*, *Madame Lambert*, and *Souvenir d'un Ami*.

**Amateurs.**—The amateurs made a first-class display in all classes, especially in the larger ones. The leading prize-winner here was Mr. R. N. G. Baker, Heavitree, Devon, who led with the best forty-eight singles, and again for twenty-four triplets, having blooms of great brightness and very clean in both instances. The following were the best:—*Prince Camille de Rohan* (very fine colour), *La France*, *Ulrich Brunner*, *Duke of Edinburgh*, *Alfred Colomb*, *François Michelon*, *Auguste Rigotard*, *Dupuy Jamin*, *Eugene Levett*, *Duke of Teck*, *Marie Baumann*, *Marquis de Castellane*, the old *Centifolia rosea*, *Merveille de Lyon*, *Madame G. Luizet*, and *General Jacqueminot*. Mr. Grant, Ledbury, Hereford, was 2nd in the forty-eight's, running very closely, and showing the usual popular varieties—*A. K. Williams*, *Dupuy Jamin*, and *Eugene Verdier* being fine. The 3rd place fell to Mr. R. Slaughter, Steyning, whose *Duke of Edinburgh* and *François Michelon* were excellent blooms; Mr. T. B. Hall, Rock Ferry, 4th. Mr. Grant was again 2nd in the class for triplets, but here his blooms were certainly smaller than Mr. Baker's, but were none the less of high quality—*Madame Eugene Verdier*, *General Jacqueminot*, *Marie Verdier*, and *Ulrich Brunner* being the best. 3rd, Mr. S. P. Budd, Bath, with *Merveille de Lyon*, *Comtesse d'Oxford*, and *François Michelon*, in fine form.

Mr. J. Ridout, gr. to T. B. Haywood, Esq., Reigate, was also a very successful exhibitor, leading for thirty-six distinct singles, and for eighteen distinct triplets; the blooms were not over-sized, uniform throughout, and in colour and form were first-rate. Mr. E. B. Lindsell, Hitchin, and Mr. J. Brown, gr. to Mrs. Waterlow, Great Doods, Reigate, were respectively 2nd and 3rd in both classes, but the best flowers were in the single class. Mr. Ridout's finest were *Ch. Lefebvre*, *Mrs. J. Laing*, *Marie Baumann*, *Etienne Levett*, *Captain Christy*, *General Jacqueminot*, *Marie Finger*, and *François Michelon*; of Mr. Lindsell's, *Ulrich Brunner*, *A. K. Williams*, *Alfred Colomb*, and *Comtesse d'Oxford*.

Mr. R. E. West, Reigate, led for twenty-four singles, and also for twelve triplets, having a pretty, clean lot, in which *Etienne Levett*, *Innocente Pirola*,

François Michelon, Gabriel Luizet, and Duke of Edinburgh were the finest. The Rev. H. A. Berners, Ipswich, was 2nd for singles, with Ulrich Brunner, Gloire Lyonnaise, and Baroness Rothschild—very close.

For triplets the 2nd prize fell to Rev. A. Foster-Melliar, Ipswich, also close—Mrs. Baker, Etienne Levet, and Duchesse de Morny being the best examples.

Mr. H. Foster, Ashford, Kent, sent the best six in three with Ulrich Brunner, Dupuy Jamin, and Duke of Edinburgh as his best blooms; and with a very bright lot took 1st for eighteen singles with Dupuy Jamin, A. K. Williams, Pride of Ashford, and Duke of Wellington; 2nd to Miss F. Baker, Reigate, showing well Duke of Edinburgh, Madame G. Luizet, and Ch. Lefebvre.

For the best twelve distinct singles, Rev. A. Cheales, Brockham Vicarage, Surrey, led with a very fine lot, taking the Silver Medal for the best (amateurs) H.P. with Camille Bernardin, shown in this lot with Dupuy Jamin, Duke of Edinburgh, and Beauty of Waltham.

In Teas and Noisettes the Rev. F. R. Burnside, Gloucester, led for eighteen with a handsome lot, neat and even, and finely coloured—Madame Lambert, Souvenir d'un Ami, Jules Finger, Marie Van Houtte, Madame Pravy, and Maréchal Niel were fine blooms. Rev. F. Roberts, Scole, 2nd, with a close lot—Madame Cusin, Catherine Mermet, and Madame de Watteville, being well shown.

Mr. R. L. Knight, Sittingbourne, had the best twelve, Mr. O. G. Orpen, Colchester, being 2nd—both having good stands; and to a bloom of Madame Cusin from Mr. Knight the Silver Medal for the best Tea or Noisette (amateurs) was awarded; Marquise de Sanina, Souvenir de Paul Néron, and Comtesse Riza du Parc, were also well shown.

The best nine singles came from the Rev. L. Garnett, Chester, a good even lot—Jules Finger and Madame Cusin being fine. The Rev. F. R. Burnside had the best twelve in triplets, neat and average size; Madame Cusin, Souvenir de G. Druet, Madame Lambert, Jules Finger, and Rubens, were fine. 2nd, the Rev. H. A. Berners, with good Madame de Watteville and Comtesse de Nadaillac. The Rev. A. Foster-Melliar had the best six of any sort, showing large and well coloured specimens of Marie Van Houtte.

**Open Classes.**—For the best twelve single trusses of any yellow variety except Maréchal Niel there were four competitors. 1st, Mr. G. Prince, Oxford, with superb blooms, Comtesse de Nadaillac, all, with one exception, being of that partially open, all, with this Rose looks best; 2nd, Mr. F. Cant, Colchester, with Marie Van Houtte—fine half-expanded blooms.

Twelve single trusses of any white Rose except Niphetos.—Here eight competed, and the 1st fell to Mr. S. P. Budd, 8, Pay Street, Bath, who had very fine full fresh blooms of Merveille de Lyon; 2nd, Messrs. Paul & Son, Old Nurseries, Cheshunt, with The Bride, a white Rose, with a greenish tinge and not large blooms; 3rd, Mr. B. R. Cant, Colchester, with Merveille de Lyon, good specimens, but slightly injured by rain. In the unsuccessful stands blooms of Captain Christy and Merveille de Lyon came out well from all others.

Twelve single trusses of any crimson Rose, except Marie Baumann or A. K. Williams.—In this class the competition was severer than in any other—eleven competitors entering, and the Colchester Roses of Mr. B. R. Cant won the 1st place, his Duke of Edinburgh being of perfect form, fine substance, and had been out at the right moment. Mr. F. Cant was 2nd, with the same variety; and Mr. C. Turner, Slough, was 3rd, with perfect but rather small flowers of Camille Bernardin. Ulrich Brunner, Etienne Levet, were very good in other stands.

Twelve single trusses of any dark velvety Rose.—In this class five competitors entered, and here Mr. C. Turner came in 1st with Prince Arthur, fine in colour, and thick in petal, and of large size; Mr. B. R. Cant was placed 2nd with Prince Camille de Rohan, a good stand, and even; Messrs. Paul & Son, Old Nurseries, Cheshunt, were 3rd, showing also Prince Camille de Rohan, pretty blooms, but unequal in size. Elclair was shown by others, but its petals are too much folded in, and the flowers too small for an exhibition Rose; Louis Van Houtte, as seen in one stand, was rough—perhaps the effect of bad weather.

The class for twelve trusses of Maréchal Niel brought only one competitor—Mr. B. R. Cant—who was awarded the 3rd prize.

Twelve single trusses of Marie Baumann.—In this class four competed, and the 1st prize fell to Mr. C. Turner, for a stand of blooms perfect in all points;

Mr. G. Mount, Rose Nurseries, St. Dunstons, Canterbury, was 2nd, his flowers being fresh, and good in shape, but irregular as to size.

Twelve single trusses of Lady Mary Fitzwilliam.—Mr. G. Prince, always strong in Teas and Hybrid Teas, came in 1st with massive blooms, grown to their fullest size; 2nd, Messrs. Harkness & Son, Bedale, with fine blooms, but which had suffered from the rain.

In the class for twelve single trusses of A. K. Williams—1st, Mr. B. R. Cant, with fine quality, but under-sized blooms; 2nd, Mr. F. Cant, whose blooms dwindled from medium-sized to quite small ones: eight competed.

For twelve single trusses of Her Majesty, the 1st prize was taken by Messrs. Paul & Son, Cheshunt. As shown the flower was not coarse, was very symmetrical, and in the half-opened bud state most pleasing. No other competitors.

For twelve single trusses of Niphetos, Mr. B. R. Cant took the 1st and only prize awarded.

Twelve single trusses of any new Rose, except Her Majesty.—1st, Messrs. Paul & Son, Cheshunt, with Mrs. John Laing, a flower of a deep rose colour, bold, and of fine substance and form—the colour is not a common one in modern varieties; 2nd, Mr. B. R. Cant, with The Bride the half-open buds of which are pretty.

New Roses, distinct, twelve single trusses.—In this class only two growers competed—Messrs. Paul & Son, Cheshunt, who took 1st prize with Her Majesty, Madame Hy. Perrière, Mrs. J. Laing, Madame Norman Neruda, Lady Alice, Madame Baulot—a flower the colour of Comte de Paris, Victor Hugo, The Bride, Grand Mogul, and Madame Massiacut, a Rose with the colour of Her Majesty, and pretty as a half-opened flower. Mr. B. R. Cant 2nd, with some handsome varieties of which may be specified Lady Helen Stewart, Earl Dufferin, Gloire de Margottin, bright crimson, a pleasing flower; Madame Joseph Desbois, delicate flesh colour, approaching white, and a compact flower; Mr. F. Bennett, purplish-crimson, which, when half opened, is pretty, but the petals are too few to make a good exhibition flower. The 3rd prize was withheld.

In the class for three single trusses of any new seedling Rose, or distinct sport, not yet in commerce, no award was made, although Mr. G. Prince showed Souvenir de S. A. Prince, a semi-transparent petalled, white Rose.

Collection of garden Roses, excluding all H.P.'s, T's, and N's mentioned in the N.R.S.'s catalogue of exhibition Roses.—In this class nurserymen only have a chance of receiving 1st honours, and so it happened that the 1st and 2nd fell to Messrs. Paul & Son, Cheshunt, and Messrs. G. Bunyard & Co., Maidstone; and the 3rd to the Rev. J. H. Pemberton, Havering-atte-Bower, Romford, who showed a fine collection, but unnamed.

For twelve bunches of Moss and Provins Roses Messrs. G. Bunyard & Co. were 1st—a very good collection in full flower; 2nd, Mr. J. House, Peterborough.

Four lots of button-hole Roses were shown, Mr. J. Mattock, Headington, Oxford, taking the 1st prize; Messrs. Paul & Son, Cheshunt, the 2nd.

**Flowers, Fruits, and Vegetables.**—Messrs. J. Veitch & Sons, Chelsea, exhibited eight boxes of superior blooms of H.P.'s; Messrs. J. Cheal & Son, Crawley, Sussex, exhibited six boxes of Roses and of hardy flowers; Mr. C. Turner, Carnarvon, and Picotees in pots; Messrs. Dobbie & Co., Rothsay, N.B., showed many stands of various breeds of Pansies—showy, fancy, spotted; also varieties of Violas. The show of these flowers appeared to afford much pleasure to those who do not know how much Pansies and Violas have been improved by Northern growers, and how much better they are able to grow them than we in the South.

Mr. Stacey, Dunmow, exhibited a choice lot of Verbena blooms, and Mr. Taylor, Hampton, Roses.

Mr. J. House, Peterborough, had one, two, and three-year plants, grown in the open ground, of his Strawberry Victory, and stated by him to be raised by crossing President and British Queen. The plants were very robust in growth, and carried, some of them, about a hundred fruits. The fruit-stalk is stout, like President, and carries its fruit well off the soil; colour of fruit like British Queen when well ripened, the flavour also is distinctly that of that variety, and the shape is either cockscomb or wedge. The plant is said to bear well on one-year-old runners. The variety must be regarded as an acquisition of no mean merit, and in a good season the flavour would be still more decided than is the case now.

Messrs. Sutton & Sons, Reading, offered prizes for Peas and Melons. Mr. Palmer, gr. to W. H. Hume-Dick, Esq., Thames Ditton, took 1st for Melons with a good Hero of Lockinge, and Mr. C. J. Waite, Glenhurst Gardens, Esher, 2nd, with Imperial Green flesh; and 1st for Peas with a good dish of well developed pods.

Messrs. Carter & Co. also offered prizes for Melons. Mr. G. Collins, gr. to J. A. Rose, Wandsworth Common, and Mr. Waite were respectively 1st and 2nd, both sending fine fruits.

From Messrs. Cannell & Sons, Swanley, Kent, was a large group of tuberous Begonias; and from Messrs. T. Rivers & Sons, Sawbridgeworth, was sent a fine collection of dishes of fruit trees in pots, Cherries, Peaches, and Nectarines being largely shown, and also Citrus vulgaris (the Myrtle-leaved Orange) in fruit, the trees being about 3 feet high, and bearing numerous fruits.

## ROYAL HORTICULTURAL.

**TUESDAY, JULY 10.**—A small collection of exhibits were observed on the above occasion at the Drill Hall, Westminster, the best of them perhaps being the plants and flowers from Kew; flowering shrubs, and Peas from Messrs. J. Veitch & Son's nursery, and a new Campanulaceous plant, *Ostrowskya magnifica*, noticed in our last issue. Some tuberous Begonias were shown in competition in response to an offer of prizes by Messrs. J. Laing & Sons, Forest Hill; and hardy flowers were shown by Mr. T. S. Ware, Messrs. Kelway & Sons, and others.

### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. S. Hibberd, W. Holmes, R. Dean, H. Herbst, J. Walker, J. Laing, Rev. W. Wilks, T. Baines, C. Noble, B. Wynne, J. Dominay, H. M. Pollett, J. O'Brien, A. F. Lendy, W. Goldring, E. Hill, and J. Nicholson.

From Messrs. J. Veitch & Sons were the very dwarf rock plant, *Pratia angulata*, covered with its small white blossoms; *Gymnogramma Pearcei robusta*, a variety with finely-cut fronds of a triangular shape, which are from 12 to 18 inches long, the colour a tender shade of green, but without farina; *Clethra alnifolia*, many plants well-flowered; the dwarf foliaceous *Philadelphus microphyllus*, with white flowers, three-quarters of an inch in diameter; *Ostrowskya magnifica*, hardy perennial of 5–6 feet in height, the stems being crowned with campanulate flowers of pale lilac colour, veined with a darker shade of colour, and 4 inches across the mouth; it was received from M. Max Lechtlin, Baden, and is now flowering for the first time in this country. A novelty in flowering shrubs was *Ceanothus Marie Simon*, the flowers numerous, in corymbs, of a reddish-pink; also *Hydrangea* species, from Japan, with cerulean blue flowers. Other exhibits were *Escallonia Philippiana*, *Andromeda speciosa* var. *pulverulenta*, *Carpenteria californica*, *Clematis coccinea*, *Spiraea palmata* purpurea, and some flowers of new warm-house *Rhododendrons*, of which *Souvenir de J. H. Mangles*, an orange-red, and large truss, was considered by the committee to be the best. Several bunches of showy varieties of *Gladiolus racemosus* came from the Veitchian nurseries.

Mr. Thorpe, Esq., Manningham, Chorley, Bedford, showed *Grandæopisella Ellisi*, a charming Orchid with two massive spikes of white and rich brown coloured flowers, to which a Cultural Commendation was awarded.

Mr. Eckford, gr. to Dr. Sankey, Boreatton Park, Shrewsbury, exhibited, as usual, many varieties of Sweet Peas, some which were new shades of colour, and all were highly Commended. The handsome North American shrub, *Carpenteria californica*, was shown in flower by Miss Jekyll, Muntead, Surrey. Sweet Williams and Sweet Peas, Dutch Honeysuckle and garden Roses came from Mr. J. Walker, Thame.

Flowering stems of *Lilium Hansoni*, L. Szovitziana, and cut blooms of *Erigeron multiradiatum*, a Himalayan species, with blue-purple ray florets and orange disc, came from the garden of G. F. Wilson, Esq., at Wisley. The Lily stems were from 6 to 7 feet in height.

Messrs. Kelway & Sons' exhibit contained many cut blooms of *Gaillardia*, *Amaryllis*, and *Delphinium*; of the latter, *Ustane*, a light blue, and *Prince of Naples*, a handsome metallic-purple coloured variety, were considered to be the best.

Mr. T. Ware, Hale Farm, Tottenham, contributed his usual large show of cut flowers of hardy plants, and *Allium pedemontanum*, a plant with umbels of

tubular flowers, short, and of a rosy-purple colour, the flower-stalk 18 inches in height. The plant is destitute of odour.

The valuable exhibit from the Royal Gardens, Kew, was composed of such a number of rare plants, that we herewith append a complete list:—

*Plants*.—*Begonia Haageana*, n. sp.; *Schubertia grandiflora*, *Isoloma hirsuta*, *Eugenia myriophylla*, *Pritchardia Thurstoni*, *Medinilla erythrophylla*, *Hemantthus Katherina*, *Olearia insignis*, n. sp.; *Ornithochilus fuscus*, *Astelia montana*, *Albica Nelsoni*, *Chironia linearis*, *Salvia scapiformis*, *Sarracenia Courtii*, *Sempervivum holochrysum*, *Statice Bourgei*, and *Schœnia Cassianina*.

*Ferns*.—*Chilanthus radiata*, *Davallia pulchra* var., *Dicaple aspidioides*, *Aspidium* sp., *Asplenium formosum*, *Davallia feniculacea*.

*Flowers*.—*Tweedia corulea*, *Streptocarpus Rexii* vars., *S. Dunnii*, *S. Watsonii*, *X. Kewensis*, *Gasteria Oronchera*, *Fassiflora corulea* racemosa, *P. c. x. Kermesina*, *Nympha stellata purpurea*, *N. zambarensis*, *Hedychium longifolium*, *Milletia mesasperma*, *Aristolochia braziliensis*, *Lissoclichus Krebsii*, *Watsonia plantaginea*, *Aristolochia elegans*, *Gongora quiquevulnera*, *Nympha kewensis*, *N. Lotus*, *N. Ortiesiana*, *Anemopygma racemosa*, *Begonia Chamberlaini*.

*Herbaceous Plants*.—*Campanula Rainieri*, *Eriopetalum reniforme*, *Erythraea diffusa*, *Linaria triornithophora*, *Penstemon rotundifolius*, *Phyteuma lichenifolium*, *Primula mollis*, *P. erosa*, *P. imperialis*, *Wahlenbergia saxicola*, and *Pratia littoralis*.

*Flowers of Herbaceous Plants*.—*Alstroemeria aurantiaca*, *A. aurea*, *Campanula Hendersoni*, *Allium coruleum*, *Dianthus Grevei*, *Galax aphylla*, *Mimulus cardinalis* var., *Podophyllum Emodi*, *Statice leptostachya*, *Senecio macrophylla*, *S. japonica*, and *Veronica Traversii*.

*Flowers of Shrubs*.—*Carpenteria californica*, *Periplota gracilis*, *Rosa indica monstrosa* (Rose Verte), and *Vaccinium madagascariense*.

*Senecio japonica* makes a pretty object with its flower-heads 2 inches across, and all bright yellow; but is beaten for effect by the flower-spike of *Senecio macrophylla* densely packed with small yellow flowers. *Primula mollis* has pretty rosy-lilac flowers, and would be very attractive if the flowers were only produced in greater profusion. The numerous produced flowers of *Linaria triornithophora*, deep lilac with yellow crests, render it a favourite, and the green Rose is noticeable more on account of its strangeness than its beauty. *Viola* (Eriopetalum) reniforme, a pretty little plant attaining about 4 inches in height with flowers of violet tipped with white, was shown in a pan and looked well. *Isoloma hirsuta* is a striking plant, flowers bright scarlet, leaves deep dull green, marked sparingly with red-brown, and densely covered with hairs. The various *Streptocarpus* made a pretty display in a cut state, but the plants are not graceful in growth. One of the most conspicuous of the plants in this exhibit was a fine specimen of *Begonia Haageana*, a new Brazilian species in the way of *B. echinosepala*, but much larger. The flowers are produced in large clusters, each flower measuring about 1 inch in diameter, pale pink in colour. *Olearia insignis* is a pretty shrub, and is almost, if not quite, hardy in this country; it was shown in flower. *Medinilla erythrophylla* was represented by a flowering plant; this is a remarkable species, producing its small flowers on the stem from the base upwards almost to the top. Of the *Begonia Chamberlaini* a strange one, greatly resembling in appearance *Adiantum hispidulum*; it is a new species. Mention should also be made of *Pritchardia Thurstoni*, a new Palm, the plant shown being about 3 feet high.

From Messrs. Paul & Son, Cheshunt, was sent a group consisting chiefly of ornamental foliaged hardy trees, which were very numerous, and among which was *Prunus domestica variegata*, with bright yellow variations towards the margin of the leaf, to which a certificate was awarded. Others were a silver-leaved Elder, white, with green spots; golden forms of *Ulmus plumosus*, and of *Philadelphus Ligustrum*, *Corylus*, *Laburnum*, and of *Spiræa*. Of purple-leaved trees the best examples were *Prunus Pissardi*, which is also a good flowerer; the purple Peach, and the purple Elm. The bright red fruits of *Acer tartaricum* render it a striking object. A variegated form of the Turkey Oak, the variegations being almost white, is very pretty. Plants of *Veronica Traversii* procer, flowering at about 1½ foot in height, were also shown. *Acer Negundo aureo variegata*, and a cut-leaved *Sambucus racemosa*. The same firm also sent a collection of garden Roses, containing

such varieties as *W. A. Richardson*, white Provence, *Rosa rugosa*, *Mercedes*, *Simplex*, *Bennett's Seedling*, &c.; and they also sent a few alpine and rock plants, showing several *Campanulas* and *Belliums*, and also *Hydrangea japonica rosea*, very pretty.

Mr. B. Noakes, Brockley, and Messrs. Hooper & Co., Covent Garden, sent *Carnations*, all pale yellow; to Germany, from the latter, a Certificate was given, it is sulphur-yellow, good form, and slightly scented, and will probably be very useful for cutting purposes: it is likely to be more popular than *Pride of Penshurst*, which it closely resembles, but is a shade or two lighter in colour.

Prettily spotted *Gloxinias*, and a rich red and brown *Coleus* were sent by Messrs. H. Cannell & Sons, Swanley, Kent.

A bright show was made by the boxes of cut blooms of *Begonias* staged by Messrs. J. Laing & Sons, Forest Hill, S.E. the flowers being large and of varied colouring, both double and single varieties being represented, one bloom of a double yellow measuring quite 3 inches in diameter.

Orchids were not numerous shown. Mr. Ridout, gr. to T. B. Haywood, Esq., Reigate, showing two boxes of cut spikes of *Odontoglossums*, the large majority of which were forms of *O. crispum*; it made a gay exhibit. He also sent *Odontoglossum Harryanum*, *Cypripedium bellatulum*, and a good white form of *Miltouia vexillaria*.

A flowering plant of *Cœlogyne Sanderiana* was shown by Mr. Jaques, gr. to Baron F. de Rothschild, Waddesdon Manor, Aylesbury; the flowers are fairly large, dull white, with a yellow crest, the throat being lined with brown.

G. F. Tautz, Esq. (gr., Mr. Cowley), Studley House, Shepherd's Bush, sent *Dendrobium hircoglossum*, pale rose-lilac, well-flowered; *Cattleya Gaskelliana superba*, finely coloured, with a broad expanded lip, very deep in colour, and regular narrow margin of the ground colour; also *C. G. alba*, pure white, with a yellow throat; and *Cypripedium Wallisii*, which has long tails, like caudatum, with a marble-like white intoned edge to the lip.

*Lœlia majalis*, *L. Crawshayana* and *L. autumnalis*, were sent by Messrs. F. Sander & Co., St. Albans, the first named only being in flower.

A few exhibits of cut roses were attractive. T. B. Haywood (gr. Mr. Ridout) sending a lot of clean and bright blooms of Duke of Wellington, Captain Christy, Xavier Olibo, A. K. Williams, Marquise de Castellane, Etienne Levet, and Mdlle. M. Verdier were good blooms. Messrs. Keynes, Williams & Co., Salisbury, sent six boxes of cut bloom, which were rather past their best. Messrs. W. Paul & Son, Waltham Cross, N., also sent Roses. Mr. C. J. Graham, Croydon, S.W., sent a few very bright blooms. A good specimen of *Lilium Thompsoni* Kramer also came from him.

An extensive collection of Ferns from Mr. May, Dyson's nursery, Upper Edmonton, N., was a feature, the numerous species and varieties being tastefully arranged. *Pteris hybrida* is compact and erect, *P. tremula elegans* is one with a graceful spreading and drooping habit, also very pretty. Other *Pterises*, with *Chelanthus* and *Adiantums*, including *A. Weigandii*, were the chief constituents. *Prizes* offered by Messrs. J. Laing & Sons, Stanstead Park Nursery, Forest Hill, for six and three specimens of tuberous *Begonias*. Six plants.—1st, Mr. Newell, gr. to Sir E. Sanders, Fairlawn, Park side, Wimbledon, massive well-bloomed old varieties; 2nd, Mr. Wright, gr., Devonhurst, Chiswick; 3rd, Matthew Hodgson, Esq., Shirley Cottage, Shirley, Surrey, small plants, freely bloomed. Mr. Hodgson also took the 1st prize in the smaller competition, and Mr. Wright was awarded a 3rd prize for his exhibit of three plants.

#### FIRST-CLASS CERTIFICATES.

To *Prunus domestica variegata*, from Messrs. Paul & Son.

To *Delphinium Ustane*, from Messrs. Kelway & Son.

To *Delphinium Prince of Naples*, from Messrs. Kelway & Son.

To *Allium pedemontanum*, from Mr. T. S. Ware.

To *Pteris tremula elegans*, from Mr. H. B. May.

To *Ostrovskya magnifica*, from Messrs. J. Veitch & Sons.

To *Gymnogramma Pearcei robusta*, from Messrs. J. Veitch & Sons.

To *Rhododendron Souvenir de J. H. Mangles*, from Messrs. J. Veitch & Sons.

To *Escallonia Phillipiana*, from Messrs. J. Veitch & Son.

To *Carnation Germania*, from Messrs. Hooper & Co.

To *Cœlogyne Sanderiana*, from Baron F. de Rothschild.

To *Carpenteria californica*, from Miss Jekyll.

#### MEDALS.

*Silver Banksian*.—To Messrs. Kelway & Son, for *Delphiniums* and *Gaillardias*; to T. B. Haywood, Esq., for *Roses* and *Orchids*; to Mr. T. S. Ware, for cut flowers; to Messrs. Paul & Son, for group.

*Bronze Banksian*.—To Messrs. Keynes, Williams & Co., for cut roses; to Mr. May, for Ferns; to Messrs. J. Laing & Sons, for cut flowers of *Begonias*.

#### Fruit Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. R. D. Blackmore, J. Wright, P. Crowley, J. Willard, and J. Roberts.

Of the exhibits of interest in this section were the Peas, haulm and all, from Messrs. J. Veitch & Sons, Chelsea. These were hung up by the heels on a pole, and thereby afforded a good idea of their relative height when fully grown and in bearing, and being, moreover, arranged according to the dates at which each came into use, afforded an excellent idea of their earliness and bearing character. Beginning with the earliest, at the left-hand, we found Veitch's Extra Early, a short-podded Pea, abundant cropper, apparently nearly all ready to pick at one time. Fit to gather June 27. Height 2 feet. Earliest of all, is of the same height, a good bearer, and ready at the same date as the first named.

*Emerald Gem* is a free variety, with a short thick pod; and *William I.* (Chelsea Gem), 1½ foot in height, free bearer, small pods and seeds. Ready on June 28. American Wonder, a poor bearer, also Little Gem, but little better, were ready June 29. *William Hurst* has a thin scimitar-shaped pod.

Of the taller varieties we may mention the Auvergne, an old Pea; Telephone, Telegraph, and Duke of Albany, as being good bearers. The first named being one of the earliest (July 7), and certainly the best cropper.

Messrs. W. Lovel & Sons, Driffield, Yorks, sent *Strawberries* *La Grosse Sucrée* and *Vicomtesse H. de Thury*. A Melon, and Tomato Favourite came from Mr. Palmer, gr. to W. F. Hume-Dick, Esq., Thames Ditton, the Tomato being sent as an early variety. Early Hereford Cauliflower—the heads being about 4 inches across, and the plant dwarf, was shown from the Society's gardens at Chiswick; it is a capital sort, delicately flavoured.

#### BRAINTREE AND BOOKING HORTICULTURAL.

In stormy weather the annual *fête* of this persevering and well-managed Society came off on Thursday, July 5, and in the several large marquees a display was arranged which, if a little less in quantity than in some previous years, was better than of quality. The table decorations, and especially those with wild flowers, in which class Mrs. Soder took 1st prize, being remarkably good.

The Silver Cup given by Mrs. J. N. Harrison was taken by Mr. W. Dance, gr. to Colonel Lowe, Gosfield Hall; Mr. Burrell, gr. to W. W. Duffield, Esq., Chelmsford, being close up to him. Mr. Burrell, however, easily carried off the 1st of the prizes for stove and greenhouse plants in flower, given by Sydney Courtland, Esq.; Miss Cawston, of High Garrett, was 2nd.

The prizes given by Miss Cawston for eight distinct plants in 8-inch pots went to Mr. W. Dance, Mr. J. Rolfe, gr. to Captain Harrison, being 2nd.

For the most tastefully arranged group of pot plants in a space 6 feet by 4 feet, Miss Cawston was well 1st, as also in the class for six *Caladiums*, with magnificent specimens, and for a specimen stove or greenhouse plant, with a grand *Bougainvillea glabra*.

One of the best and most interesting exhibits was the collection of Ferns of Sydney Courtland, Esq., which secured the 1st prize, the same gentleman easily taking 1st also in the class for a basket of pot plants, not exceeding 30 inches in diameter, with a well arranged lot of *Orchids*, chiefly fine varieties of *Odontoglossum crispum* and *Epidendrum vitellium majus*.

The 1st prize lot of six tuberous *Begonias* of Mr. Thos. Taylor were very fine, and among them was a

grand pure white. Mr. F. Smoothy had the best Coleus. Mr. G. Clements was 1st, for six Gloxinias. Mr. Rolfe, Mr. Dance, and Mr. Brazier, and others, exhibited well in several classes, and the cut Roses of Mr. W. Brown were very fine.

Vegetables, fruit, honey, wild flowers, &c., were well represented, and altogether a good show provided. Mr. Gibbs, the Secretary, and the committee having worked well and intelligently in keeping up the character of the Society.

### TWICKENHAM HORTICULTURAL.

JULY 9.—Specially favoured with lovely weather the annual exhibition of this Society was held in the Orleans House grounds, and presented by far the best display yet made by this Society, the exhibits being not only abundant but first-class. The decorative groups were remarkably good, one from Messrs. Hooper & Co., Twickenham, coming 1st; whilst a new exhibitor, Mr. H. W. Fordham, with a very gay arrangement, came 2nd; and Mr. Filsell was 3rd. With smaller groups Mr. Buckland, gr. to J. Patkins, Esq., was 1st; and Mr. Parsons, gr. to T. Twining, Esq., 2nd.

Mr. Hill, gr. to H. Little, Esq., had the best six Orchids, all good plants; Mr. H. James, Lower Norwood, being 2nd. Mr. Hill also staged a fine group of Cattleyas, Dendrobiums, Aërides, &c., which evoked much admiration.

Mr. H. James had the best six flowering plants, Mr. Parsons being 2nd, the former having some neat Heaths, and the latter a fine *Gloriosa superba*. With foliage plants—a strong class—Mr. Parsons was a good 1st, Mr. Munro coming very close with even clean specimens. Mr. Hill was the only exhibitor of six zonal Pelargoniums, grandly flowered plants; and he also had the best twelve Begonias, medium sized plants, capitally flowered; Mr. Garrod, gr. to J. R. Tindall, Esq., having excellent plants also. Mr. Parsons had the best six Gloxinias; Mr. Garrod being 2nd, the plants being remarkably well flowered, whilst there were a few non-competitive plant groups.

The display of Roses from Messrs. W. Paul & Sons, Waltham Cross, and Messrs. Veitch & Sons formed a beautiful feature. Mr. Taylor, Hampton, also had some pretty Roses, including many of the small buttonhole varieties. Mr. Warwick, gr. to J. T. Kitchen, Esq., Hampton, was a good 1st, with twenty-four and twelve singles, also having some beautiful cut Gloxinias. Mr. W. Poupart, Twickenham, made a fine collection of hardy cut flowers.

Fruit was very good and plentiful. Mr. W. Allan, gr. to Sir G. Russell, M.P., Reading, had the best six dishes, having capital Black Hamburgs and Foster's Seedling Grapes, Royal George Peaches, Violet Hâtive Nectarines, Blenheim Orange Melon, and President Strawberries; he was also 1st with three bunches of good Black Hamburg Grapes; Mr. Thompson, gr. to Messrs. A. & E. Wells, Hounslow, coming 2nd with very fine Madresfield Court.

In the class for white Grapes, Mr. Fitzwalter, gr. to H. Labouchere, Esq., M.P., came 1st with capital Muscat of Alexandria, Mr. Allan coming 2nd with Foster's Seedling. Mr. Allan had the best six Peaches in Violet Hâtive, and Mr. O. Hickle, gr. to A. Cunard, Esq., Orleans House, had the best Nectarines. Mr. Goody showed a handsome scarlet Strawberry—a seedling, and was the 1st in a large competition. The best collection of ten kinds of vegetables came from Mr. Waite, gr. to the Hon. Colonel Talbot, Esher. Mr. Poupart showed fine Cauliflowers, and Mr. Wallace, Twickenham, had a very big show of Tobacco plants, cut flowers, and vegetables.

### FINCHLEY HORTICULTURAL.

JULY 10.—The twenty-ninth annual exhibition of this Society was held, by permission of Henry Charles Stephens, Esq., M.P., in the picturesque grounds of Avenue House, Church End, Finchley, and in response to a liberal schedule of prizes the competition was keen in most classes. The most noteworthy exhibits were the groups of plants arranged for effect, in a space of 50 feet. The 1st prize was taken by Mr. H. Eason, gr. to B. Noakes, Esq., North Hill, Highgate, for a very tastefully arranged lot of Palms, Caladiums, Pancratiums, &c.; Mr. S. Brown, gr. to J. E. B. Cox, Esq., Moat Mount, Mill Hill, being 2nd.

For six stove and greenhouse specimens, Mr. Eason took 1st with grandly flowered plants of *Allamanda grandiflora*, *Gloriosa superba*, *Ixora Williamsii*, *Erica*

*tricolor impressa*, *E. Cavendishiana*, and *Maxillaria tenifolia*. Mr. S. Barnett, gr. to R. Littler, Esq., Palmer's Green, followed with good examples of *Allamanda Hendersonii*, *Clerodendron Balfouriana*, *Statice profusa*, and *Brassia verucosa*.

Mr. Eason also had the best six fine-foliaged plants, showing *Areca Baueri*, *Croton undulatum*, *Pandanus Veitchii*, *Acalypha muscica*, *Asparagus plumosus*; and was again followed by Mr. Barnett with good plants of *Pandanus*, *Dracenas*, and *Alcacia metallica*.

The 1st place for six exotic Ferns was easily won by Mr. Brown, with *Davallia Mooreana*, *Adiantum amabile*, *Microlepia hirta cristata*, *Adiantum concinnum* in fine examples; Mr. Barnett coming 2nd with *Gymnogramma*, *Laucheana*, *Thamopteris Nidus*, *Adiantum cardiophyllum*, *Lygodium scandens*.

Orchids were not keenly contested, the best six coming from Mr. Eason, who contributed good plants of *Oncidium flexuosum*, *O. Wentworthianum*, *Cypripedium niveum*, *C. barbatum*, *giganteum*, *Cattleya Gaskelliana*, and *Aërides odoratum*.

Zonal Pelargoniums were good from Mr. H. Eason, who had Fanny Catlin, Metis, Zelia, and Edith Pearson; and the same exhibitor had the best single specimen, showing a fine plant of *Plutarch*.

The best six Fuchsias came from Mr. Brown, who had well flowered plants.

Fruit and Roses were not up to the usual quality. From Mr. B. S. Williams came a choice collection of miscellaneous plants, and Messrs. Cutbush & Son showed Roses and Palms, &c.

### WOODERIDGE HORTICULTURAL.

THIS SOCIETY held its thirty-sixth annual meeting on the 4th inst., in the Abbey grounds, which are immediately contiguous to the town, and though the day was anything but agreeable, the several attractions the committee offered drew a large number of visitors, who, now and then, as the showers fell, had to make a hasty stampede into the tents. These, on the whole, were very well filled with creditable productions, the fruit and Orchids from Lord Rendlesham being specially noticeable, and the groups of plants arranged in a space 12 by 4 feet, made a capital show. These exhibits are deserving of encouragement, as the plants grown for them are far more useful, from a general point of view, than the elephantine specimens more usually seen, although they may not perhaps call forth the same amount of skill in their culture. In the class referred to, Mr. King, gr. to J. A. Burness, Esq., of Melton, was a good 1st, both for plants and arrangement, the 2nd, 3rd, and 4th prizes going to collections which were highly creditable to the growers.

For Orchids, Mr. Rogers, gr. to Lord Rendlesham, was 1st, the *Thulias* in his lot being remarkable for high finish and health.

For six stove and greenhouse plants, Messrs. Gilbert, of Ipswich, were to the fore; the 2nd prize falling to the lot of Mr. N. Gunn, gr. to Miss Jones; and the 3rd to Mr. Spink, gr. to Mrs. T. W. Grimwood.

In the class for the same number in 12-inch pots the honours again fell to the Messrs. Gilbert, the 2nd prize going to Mr. Gunn, and the 3rd to Mr. Spink.

For the best stove or greenhouse plant in bloom, Mr. Spink was 1st, Mr. Gunn 2nd, and the Messrs. Gilbert 3rd.

The plants for table decorations, a fine lot, were arranged up the centre of the tent containing the cut flowers and Roses, which they helped to tone down and set off; Mr. King, gr. to J. A. Burness, was 1st; Messrs. Gilbert 2nd; and Mr. Best, gr. to the Duke of Hamilton, 3rd.

The Fuchsias, both in 12 and 24-sized pots, were very well grown and bloomed, the 1st prize for the larger specimens going to Mr. Spink, and the premier award for the smaller, to Mr. King.

There were numerous other classes for such plants as Cockscombs, Hydrangeas, Petunias, Achimenes, Selaginellas, Verbenas, Gloxinias, Begonias, Caladiums, Carnations, Balsams, &c., all fairly represented, but the list of prizetakers would be too long to enumerate here.

In the cut flower division the chief features were the Roses, and the epergnes containing wild flowers; in the latter of which there was strong competition, and good taste was displayed in the arrangement. The 1st prize was most deservedly awarded to Miss Susie Walker, of Melton; 2nd, Miss Canter. For the best stand for table decoration Miss Clara Walker was 1st, Mrs. Gilbert 2nd; and for the basket of cut flowers Miss Wrench was a good 1st, and Miss Susie

Walker 2nd. For a hand bouquet, made and competed for by ladies, Mrs. Chettleburgh was 1st; and for a bridal bouquet, Mr. Andrews, gr. to the Hon. W. Lowther, was 1st.

Roses.—In the amateurs' class for Roses, the Rev. H. A. Berners, of Warstead Rectory, carried all before him, he being 1st in every class, his blooms were very fine, especially those of the Teas, which were remarkably stout and firm in the petals, and perfect in colour. The Rev. Foster-Melliar also had good flowers, which won 2nd honours in the same classes.

For thirty-six, competed for by growers for sale, Mr. B. R. Cant, of Colchester, was 1st, and Mr. Wood, of Woodbridge, 2nd.

Fruit.—In the fruit department, the collection of eight dishes, exhibited by Mr. Rogers, gr. to Lord Rendlesham, was very meritorious, the Black Hamburg Grapes and Peaches and Nectarines particularly so. Excepting the Hamburgs from the same exhibitor, who took 1st, Grapes were not well ripened or coloured, and most of them wanted quite a month longer to finish.

Peaches and Nectarines were very good, the 1st prize dish of the last-named, from Mr. Chettleburgh, being remarkable for size and colour; and those from the Duke of Hamilton were very well finished.

Although the season is considered a bad one for Strawberries, these fruits were abundant and good at Woodbridge; and Cherries were particularly fine, the late rains having served to swell them up to a large size.

In the vegetable department there was a strong competition for the prize offered by Messrs. Sutton, of Reading, for ten varieties, the 1st prize going to Mr. Andrews, gr. to the Hon. W. Lowther, M.P.; the 2nd to Mr. King, gr. to J. A. Burness, Esq.; and the 3rd to Mr. Crisp.

Peas, as usual, were in great quantities, but the better kinds were not in season, and the varieties shown were chiefly William I., Duke of Albany, and Market Favourite.

## Obituary.

CALEB COPE.—American horticulture is again in mourning for one of its great patrons, Caleb Cope, one of the early founders and for many years President of the Pennsylvania Horticultural Society, in the days when this famous Society was running a race with the no less famous Massachusetts Society for the leadership of horticulture in America. Undoubtedly to these two great societies, with Wilder in one and Cope in the other, is due much of the great progress in the love of gardening which, during the last half century, has been so rapid in the New World.

Caleb Cope belonged to a family eminent among the merchants and famous men of America. Two of them—Cope Brothers—founded the famous line of packet ships between Philadelphia and Liverpool, and Professor Edward D. Cope is known for his eminent scientific attainments all over the world. Caleb Cope was born in Greensburg, Pa., in 1797, soon after America became independent, and was, therefore in his ninety-first year at the time of his death, on May 12. He became the leading dry goods merchant in Philadelphia, and after amassing considerable wealth, bought an estate called Spring Brook, in the suburbs of the city, solely to gratify his love of gardening. The grounds were beautifully laid out, and extensive ranges of glass established for the growth of fruit and flowers. When the Victoria regia first flowered, and made such a sensation in England, Mr. Cope put himself into communication with Sir Wm. Hooker, and through his assistance plants were grown, and a magnificent house built for it. Here it flowered, and was the centre of as much attraction as it received in the Old World.

The remarkable sympathy with humanity which he possessed was especially shown in his horticultural pursuits. A childless widower, but a small part of the products of the establishment was required for his own use, the rest went to friends or public institutions, the public hospitals getting the chief portion of the forced fruit and vegetables. Under his presidency the Pennsylvania Horticultural Society became the most popular institution in the city, and a large

surplus was made over and above its expenses and invested as a contingent fund. His own collections of course contributed largely to the interest of the exhibitions. All the public institutions of Philadelphia owed a large measure of success to his active and generous aid and patronage.

Suddenly, about the year 1855, by the abuse of confidence by a partner, the whole of his wealth was swept away, and the firm went into bankruptcy. The collections of plants went to the auction mart, and the estate was sold to persons with no love for horticulture. The horticultural glories of Spring Brook closed. The estate is now used as a public charity, under the will of the great tragedian, Edwin Forrest—the Forrest Home for Unfortunate Actors. Mr. Cope's friends came to his rescue. He again entered business, was successful, paid every dollar of the old indebtedness of his firm, and accumulated enough to buy another beautiful home in the suburbs of Philadelphia, turning his attention, however, to outdoor gardening only. With the same generosity that marked his earlier career, these grounds were also free to the public.

When the Southern States rebelled in 1861 there were large numbers in the South true to the old Government, who, soon after losing their wealth, escaped through the lines to the North. Among these were the widow and daughter of one of the leading families of Nashville, who came to Philadelphia. These refugees always excited the sympathy of the Northern Unionists. These two fell to Mr. Cope's charge, and he subsequently married the daughter, who, with two sons, now survive him.

On account of advanced age at the time of their decease living horticulturists have but a faint idea of the great debt due to Wilder and Cope for their work, but those who study the history of the past will fully understand the noble lesson of their lives. *Thomas Meahan.*

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending July 9, is furnished from the Meteorological Office:—

"The weather has continued in an unsettled and most unseasonable condition in all parts of the kingdom. Thunder and lightning have been of frequent occurrence in most parts of England, and at some of the Irish stations, and the falls of rain at times very heavy. In the south of London on the 6th an inch of rain fell in the short space of half an hour."

"The temperature has again been below the mean, the deficit in most districts varying from 4° to 6°. The highest of the maxima, which were recorded on somewhat irregular dates, ranged from 63° in 'Scotland, W.' to 71° in the 'Midland Counties' and England, S.W.' The lowest of the minima were generally registered towards the close of the week, when the thermometer fell to 32° in 'Scotland, N.', 34° in 'Ireland, N.' and to between 37° and 42° in most other districts. At Newton Reigny (in 'England, N.W.') the minimum on the 9th is reported to have been as low as 30°."

"Rainfall has been rather less than the mean in Scotland, as well as in the north-west of England and north of Ireland, but in most other parts of the kingdom an excess is shown, especially in the east and south of England."

"Bright sunshine has continued very deficient generally, the percentage of the possible amount of duration in most districts varying from 15 to 28. In 'Scotland, N.' the percentage was 35, and in the 'Channel Islands,' 36."

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JULY 21. (AVERAGE OF FORTY-FOUR YEARS.)

July 15 ... ..	63°·4	July 19 ... ..	63°·4

## NOTICES TO CORRESPONDENTS.

REPORTS OF SHOWS.—Several show reports have been received by us, viz., Ipswich and East of England, Glasgow and West of Scotland, Chertsey and District, which we hope to be enabled to insert in our next issue.

ANTS IN TURF: *Constant Reader*. There are many ways of getting rid of these intruders; two that are effectual, and not injurious to vegetation, are carbolic acid and Osier-bark steep. The former should be diluted with twelve times its weight of water, and poured or squirted into their haunts; the latter—which is the water in which Willow bark and Osiers for basket-making are steeped before peeling—can be used undiluted.

HERBACEOUS PLANTS: *W. C. S.* See our numbers for January 21, and February 4, of this year. *Hardy Flowers*, by W. Robinson (Macmillan & Co., London); Thomson's *Handy Book of the*

*Flower Garden* (W. Blackwood & Sons, London and Edinburgh).

LATHYRUS CERCULEUS: *S. & N. S. Co.* Very pretty and worth extended culture, but, of course, no novelty.

LETTUCE: *A Constant Reader*. We have no acquaintance with the variety you mention.

MAGNOLIA: *W. A. G.* Cut it back in September, early, the plant will then have time to develop incipient wood-buds by the springtime, when it should bristle with young growths, which may then be thinned out, leaving the strongest and best placed.

NAMES OF PLANTS: *A. C.* 1, probably *Citronaster nepalensis*; 2, *Tussilago farfara* (Coltsfoot); 3, *Agrostema Githago*; 4, *Agrostis vulgaris*—*C. A.* 1, *Phyllanthus nivosus*; 2, *Primula obconica*; 3, *Lychnis flos jovis*; 4, *Tradescantia virginica*.—*Lynnington*. The seed vessels of one of the Poplars, you do not send leaf, so we cannot tell you which—probably the Canadian. *Tyro.* 1, *Mackaya bella*; 2, *Selaginella selaginoides*; 3, *Selaginella selaginoides*; 4, *Euphorbia cyathophora*; 5, *Sedum spectabile*; 6, *Papaver nudicaule*.—*D. J. W.* *Trachelium coraeum*, white variety. *W. S. I.* *Rhus cotinus*; 2, *Escallonia rubra*, white variety. *H. J. R.* *Arum dracunculifolium*, *Ornithogalum arabicum*.—*Constant Reader*. 1, *Euphorbia cyathophora*; the Saxifrage next week. *C. A. L.* 1, *Caccinia glauca*; 2, *Lichschrolea*; 3, *Allium*, not recognisable; 4, *Sempervivum montanum*; 5, *Veronica*; 6, *Scutellaria* (see next week).—*Cajufilla*. *Habenaria chlorantha* (Butterfly Orchis).—*J. L.* 1, *Spergularia arvensis*; 2, *Polygonum aviculare* (Knot-grass, so called because it is not a grass).—*J. C. Ross*. *Cymbidium aloefolium*.—*Hy. Corder*. *Cirrhæa fuscoluteum*.—*T. Horsman*. *Odontoglossum luteo-purpureum*, which has been fertilised. *J. McL.* *Crataegus*, probably *C. tanacetifolia*, but it is impossible to say for certain from the specimen. Send when in fruit. *G. S.* Probably *Iris spuria*. The *Lupin* is a pretty form. *Aquilegia* specimens insufficient. *J. B.* *Hieracium aurantiacum*.

ONION: *O. M.* The bulb resembles *Early Nocer*; at any rate it is early, and therefore deserving of notice. Should make a pickling Onion if taken at the proper time.

ROSE: *J. K.* The union of two Roses on one stalk is not uncommon. Many thanks.

ROYAL HORTICULTURAL SOCIETY: *Grey-Beard*.—There is happily now no reason whatever to despair. Things have not been so favourable for many years. The Council has worked hard, and done wonders in the time, and, as there is still much to be done, we have no doubt they will take note of the circumstances you mention.

SHELLS: *Constant Reader*. The little conical shells found in a pot in which *Eucharis amazonica* was growing, are either *Rissoa ulva* or *Odostomia conoidea*. *I. O. W.*

MOTH: *A. M.* *Sphinx ligustri*, not uncommon.

TOMATOS: *J. F. G. B.*, and *Others*. Yes. Try the effect of sulphate of copper, as recommended last week (p. 15), and let us know the result.

## Borough of Guildford.

### CASTLE PLEASURE GROUNDS.

**THE URBAN SANITARY AUTHORITY** are desirous of ENGAGING a person as GARDENER and CARETAKER at the Castle Pleasure Grounds.

The wages will be 25s. per week, with a residence in the grounds. Applicants must not be under 30 or over 45 years of age.

Applications, with testimonials, endorsed "GARDENER," must be sent to me at my Office on or before the 16th July inst.

FERDINAND SMALLPRICE, Town Clerk.

Guildford.—July 5, 1888.

**WANTED, HEAD WORKING GARDENER**, where three others are kept. An active, steady, married man, with thorough knowledge of his duties. Good personal character.—R. H. OTTER, Esq., Queenwood, Chertsey, Surrey.

**WANTED, A SINGLE-HANDED GARDENER**, in a Small Place, an active, intelligent man, thoroughly experienced, willing to be useful indoors.—Address, stating wages and full particulars, Miss ALICE LUSHINGTON, Kingsley, Alton, Hants. Unsuitable applications cannot be acknowledged.

**WANTED, A SINGLE-HANDED GARDENER**, in Middlesex, for good Flower and Kitchen Garden with small Conservatory. Must be willing to make himself generally useful. Will undertake Laundry Cottage, gas, and 22s. per week. Washing, by contract, at 20s. more.—Particulars of age, family, experience, and character to E. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## Nursery Foreman.

**WANTED, a thoroughly experienced and energetic MAN**, as above; must be well up in Roses, Fruit Trees, &c., and general Nursery Management. None need apply whose character will not bear the strictest investigation. Apply, in own handwriting, stating age, experience, salary expected, &c., NURSERYMAN, Messrs. Street & Co., 30, Cornhill, London, E.C.

## Forest Tree Foreman.

**WANTED, IMMEDIATELY, a thoroughly practical and efficient steady, reliable, and obliging MAN.**—Apply, stating age, and where gained, age, salary expected, &c., to Messrs. DICKSONS, Chester.

**WANTED, for a first-class Florist and Nursery business, a practical FOREMAN**, married, without family preferred. One who thoroughly understands Growing Grapes, Vegetables, Bouvardias, Eucharis, Roses, &c., and Forcing Early Flowering Bulbs for Market. Must be a first-class Propagator, and able to keep Books at Nursery House and vegetables found.—Apply, stating age, wages, experience, and references, to H., 221, High Street, Lewes.

**WANTED, A PROPAGATOR and SALES-MAN.** Must be well up in the Propagation of Rhododendrons, Camellias, &c. Must be experienced in the Growing of Cucumbers, Tomatoes, and general Market Stuff in quantities. State lowest wages.—RIDER BROS., Heath Nurseries, Moor-town, Leeds.

**WANTED, a first-class GROWER of Plants and Cut Flowers, Cucumbers and Tomatoes for Market.**—Apply, stating wages required, age, experience, and where gained, to J. ILLMAN, The Nursery, Lincoln.

**WANTED, an active MAN**, age 26, accustomed to grow for Covent Garden Market, Cut Flowers, Grapes, Tomatoes, &c. Used to packing. Wages 22s. weekly.—GROWER, 41, Wellington Street, Strand, W.C.

**WANTED, a steady, pushing MAN**, with good address, as SALESMAN; also PROPAGATOR and GROWER of Plants and Cut Flowers in quantity, for a Private Trade. Must have fair knowledge of Outdoor Nursery Stock for Villa Gardens, &c. Character must bear strictest inquiry.—Apply, stating age, wages required, with references, to JAS. SMITH, Nurseries, Richmond, Surrey.

## Head Shopman or Manager.

**WANTED, a thoroughly competent MAN**, to take the Superintendence of a large Retail Seed Business. Must thoroughly understand the Trade in all its branches.—State what experience had, age, &c., to THOMSON'S Seed Warehouse, Birmingham.

## Head Shopman.

**WANTED, a thoroughly qualified MAN**, to take the Superintendence of a large Retail Seed Business. Must thoroughly understand Vegetable, Flower, and Bulb Departments. May have to Travel occasionally. Unexceptional references required.—State salary required, where last employed, age, &c., S. S., Messrs. Hurst & Son, 152, Houndsditch, London, E.

**WANTED, for Branch Business**, in London Suburbs, a SHOPMAN, under 25 years of age, with experience in Plants, Bouquets, &c., also in Seeds and Bulbs.—State antecedents and wages previously received, to B. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## To the Seed Trade.

**TRAVELLER.**—A large Retail Firm in the Provinces, REQUIRES a REPRESENTATIVE, who thoroughly knows the Seed Trade in all its branches, and has been accustomed to Travel and attend Markets. To a thoroughly competent man a liberal salary will be given.—Address, with full particulars of experience, where last employed and how long, age, &c., SEEDS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## Wholesale Seed Trade.

**WANTED, a TRAVELLER.**—Apply, stating age and experience, and salary required, to MARINER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a smart LAD**, accustomed to Packing Flowers. Must have a good reference. Wages about 15s. to 12s. per week.—MARSHALL BROS. & CO., Barnham Junction, Bognor.

**WANTED, Gardeners and Others**, to accept AGENCY for our CHOICE CEYLON TEAS, to accept among Private Families. We give 6d. per pound on the 2s. (wonderful value) and pay carriage. Weekly earnings 40s. (Apply for sample) to THE GROWERS ASSOCIATION, Union Court, E.C. (Est. 1871.) Name paper.

## GARDENING APPOINTMENTS.

MR. G. FLETCHER, late Foreman in the gardens, Eastwick Park, Leatherhead, has been appointed Head Gardener in the place of Mr. S. AGER.

MR. R. MCINTOSH, late Head Gardener at the Abbey, Great Grimby, has been appointed Head Gardener to FELIX CORBOLD, Esq., Cobbold Lodge, Felixstow.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be made to Mr. A. DEURY, 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person from receiving the money. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman acting a trustworthy and competent Gardener.

**SCOTCH GARDENERS.**—JOHN DOWIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting recommendations. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman acting a trustworthy and competent Gardener.

**WANTED, A GARDENER!!!**—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BALIFFS, or GARDENERS.**  
**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 257 and 258, High Holborn, W.C.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**GARDENER (HEAD), or ORCHID GROWER**, where two or more are kept.—Age 33, married, no family; well up in the Cultivation of Orchids, Fruit, Store, and Greenhouse Plants; also Flower and Kitchen Garden. Has been six or seven years with Captain Vere Hooper, &c. Can be well recommended as to ability and moral character.—W. SORLEY, Gardener, Craigieburn House, Moffat.

**GARDENER (HEAD);** age 35, married.—Mr. A. BECH, Head Gardener to Edgar Hibbert, Esq., Ashby St. Ledger's Lodge, Rugby, will be pleased to recommend a thorough practical man as above. Highest references.

**GARDENER (HEAD).**—MR. MOORHOUSE, Leywood Gardens, Groombridge, Tunbridge Wells, can highly recommend his Foreman, who has been with him seven years.—Address as above.

**GARDENER (HEAD).**—Earl Cowper wishes to recommend his Head Gardener at Brock Hall. Leaving because the place is left. Well up in every branch of his business.—CHARLES KINNS, Brock Hall, Welwyn.

**GARDENER (HEAD),** where three or four men are kept.—Unmarried; moderate wage. Good all-round practical man. Place preferred in the neighbourhood of London.—J. B., 28, High Street, Kensington, S.W.

**GARDENER (HEAD),** where two or more are kept.—Age 35, married, no family; experienced. Good character. 45 will be paid to any person enabling him to get a comfortable situation.—W. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**GARDENER (HEAD),** where two are kept; age 27; married when suited.—C. BLICK, an excellent reference recommend to any Lady or Gentleman requiring a steady, trustworthy man as above, to T. Lupton, Gardens, Summerfield House, Elstree, Herts.

**GARDENER (HEAD).**—Age 40; thoroughly practical in all branches. Early and Late Forcing, Stove Plants, and Orchids. Eleven years in present situation. Highly recommended.—T. L. BAILEY, Holt House, Mill-houses, Sheffield.

**GARDENER (HEAD).**—Age 30, married when suited.—Mr. COOTMAN, 10, Spens Road, Wandsworth, Surrey, S.W., wishes to recommend T. Keene as above. Fifteen years' experience in Early and Late Forcing of Fruits, Flowers, and Vegetables; also Flower and Kitchen Garden.—Please apply as above.

**GARDENER (HEAD);** age 37.—Miss SHERIDAN wishes to recommend S. Pullman. Thoroughly experienced in all branches. High wages, as exhibitor at Crystal Palace and other shows; had charge of Plantations. Fourteen years' personal character; left through death of Miss SHERIDAN, 77, Eaton Square, S.W., or S. PULLMAN, Evershot, Dorset.

**GARDENER (first-class HEAD WORKING).**—Age 35; understands his profession in every branch. His mother, being an excellent Laundress, could undertake the Laundry in a large establishment, also good Dairy Woman. Highest characters.—A. B., 58, Tynley Road, Bromley, Kent.

**GARDENER (HEAD WORKING);** age 23.—Mr. HOPE, Gardener to the Earl of Jersey, Middleton Park, Bicester, Oxon, can recommend his Foreman, Thos. Trollope, as above. Nearly fourteen years' experience.—Address as above.

**GARDENER (HEAD WORKING).**—Age 39, married, one daughter (age 12). Twenty-four years' thorough experience in all branches. Good character and testimonials.—C. C., Hillfarrance, Taunton.

**GARDENER (HEAD WORKING).**—Middle-aged, married; has a thorough practical knowledge of the profession in all its branches. Three and a half years in last situation; eight years previous. Excellent references.—A. B., 15, Welles Street, Grantham.

**GARDENER (HEAD WORKING).**—Age 46, married, no family; well experienced in growing Grapes, Peaches, Melons, Cucumbers, Tomatoes, Flower and Kitchen Garden, &c. Four years' good character.—D. B., The Gardens, Oak Lodge, Southgate, N.

**GARDENER (HEAD WORKING),** where three or four are kept.—Age 39, married; good practical knowledge in all branches of Gardening. Excellent references from past employers.—J. B., Murrell's Cottages, Crawley Road, Horsham, Sussex.

**GARDENER (HEAD WORKING);** age 30, single as present; four years' good character.—Mr. ALDERMAN, The Gardens, Eppingham Hill, Dorking, highly recommends his Foreman, S. Bigwood, as above. Thoroughly trustworthy and competent.

**GARDENER (HEAD WORKING).**—Single; experienced in Flowers, Fruit and Vegetables. Good recommendations. Country preferred.—TOMIS, 2, Station Cottages, Broxbourne, or Paul & Sons' Herbaraceous Nursery, Broxbourne.

**GARDENER (HEAD WORKING).**—Age 32, married.—Advertiser begs to offer his services to a Nobleman or Gentleman requiring a thoroughly practical and energetic man in all departments. Seventeen years' experience in first-class establishments. Highly recommended.—W. COOK, Turford, Huddersfield, Herts.

**GARDENER (HEAD WORKING).**—Age 36, two children.—Advertiser has twenty years' practical experience. Highly recommended as a thoroughly competent and trustworthy Gardener. First-rate Fruit, Plant, and Vegetable Grower.—W. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**GARDENER (HEAD WORKING);** age 30.—Mr. AGGERS, Gardener to the Right Hon. the Earl of Eppingham, will be pleased to recommend his Foreman as a thoroughly practical man, well up in Plant and Fruit Culture, and General Gardening. Good references. Three years here as General Foreman.—W. PROSSER, Tusmore Park Gardens, Bicester, Oxon.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 38, married; twenty years' experience in all branches; seven years in present situation; twelve years previous.—H. M., 3, South Terrace, Franklin Road, Norbiton.

**GARDENER, good.**—Can be recommended by Mr. T. WOOD, Eastville, Bristol.

**GARDENER (WORKING);** age 33, married, two children.—LORD DRYVER wishes to recommend his Foreman, who has been with him ten years.—Dryver Castle, Llandilo, South Wales.

**GARDENER (good SINGLE-HANDED).**—Age 25; has obtained thorough practical knowledge of Fruit, Plant, and Vegetable Growing in well-kept gardens. Highest references. Please state full particulars.—P. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**GARDENER (SINGLE-HANDED).**—Age 32; married when suited. Thoroughly practical; willing to be useful. Good references.—State wages to J. F., Abbey Mount, Belvidere, Kent.

**GARDENER (SINGLE-HANDED).**—Age 32, married, no children; three years' good character in five years previous. Well up in Flowers, Fruit, and Vegetables.—J. P., 7, Barnwell Road, Brixton, S.W.

**GARDENER (SINGLE-HANDED, or good SECOND).**—Understands Flower and Kitchen Garden. Good references. Total abstinence.—W., 12, Ross Villas, Richmond, S.W.

**HOLLOWAY'S PILLS.**—Depression of Spirits, Debility.—Some defect in digestion is generally the cause of mental depression.—On rectifying disordered stomach, the long list of gloomy thoughts retires, and is succeeded by more hopeful and happy feelings. Holloway's Pills have been renowned far and wide for effecting desirable change without inconveniencing the morbidly sensitive or delicate organism. They remove all obstructions, regulate all secretions, and correct depraved humours by purifying the blood and invigorating the stomach. Their medicinal virtues reach, relieve, and stimulate every organ and gland in the body, whereby the entire system is renewed by the medicine ever before discovered acts so beneficially upon the blood and circulation as Holloway's celebrated Pills.

Carriage paid in United Kingdom on Orders of £1 nett. Sold by all Seedsmen and Florists.

THE HORTICULTURAL & AGRICULTURAL CHEMICAL CO., 103, Holm Street Glasgow.  
Please note our Trade Mark, without which none is genuine.

CONTRACTORS TO HER MAJESTY'S WAR DEPARTMENT.

## THE THAMES BANK IRON COMPANY

(Telegraphic Address—"HOT-WATER, LONDON." Telephone—No. 4763).

ORIGINAL MANUFACTURERS OF THIS CLASS OF BOILER.

Supplied in several sizes for the last Thirty-five Years to the Leading Horticulturists.

Several improvements have  
from time to time been in-  
troduced, including Water  
Bars, Furnace Door hung  
upon the front of Boiler,  
&c., as shown in illustration,

thus making it complete in  
itself.

There has been a great  
demand for this Boiler, and  
the success attending it has  
been general.

THE LARGEST AND MOST COMPLETE STOCK OF

## HOT-WATER BOILERS OF EVERY DESCRIPTION,

PIPES, CONNECTIONS, VALVES, VENTILATING GEAR, &c.;

and invite Inspection of same.

Price List on application, free.

Illustrated Catalogue, 1s.

UPPER GROUND STREET, BLACKFRIARS, S.E.

New Edition, Corrected up to Date.

## PAXTON'S CALENDAR.

THE COTTAGER'S CALENDAR  
OF GARDEN OPERATIONS.

(TWO HUNDRED AND FIFTY-SIXTH THOUSAND.)

By the late SIR JOSEPH PAXTON, M.P., Reprinted from the *Gardeners' Chronicle*.

Price 3d., Post-free 3½d.;

Twenty-five Copies, 5s.; fifty, 10s.; and one hundred, 20s.  
Parcels of not less than fifty delivered, Carriage Free, in London only.  
Not less than one hundred Carriage Paid to any part of Great Britain.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

## SEEDLING PLANTS OF CHOICE FLORISTS' FLOWERS.

WE HAVE MUCH PLEASURE in offering the following in strong, healthy, transplanted young stuff, from our superb strains of Choice Florists' Flowers. Free and Safe by Post at Prices quoted.

	Per dozen.—s. d.
AURICULAS, Alpine, very choice, strong young plants, for blooming next season	2 6
CALCEOLARIAS, herbaceous, splendid strain of beautifully spotted and tinged flowers	2 6
CARNATIONS and PICOTÉES, from choice named flowers	per 100, 10s. 6d.
CARNATIONS, yellow ground varieties	3 6
CINERARIA hybrida, from a grand strain, per 100, 10s. 6d.	3 6
large flowered, dwarf, very fine, per 100, 17s. 6d.	2 6
HOLLYHOCKS, Chater's superb double, per 100, 16s. 2 6	
Chater's superb double, extra strong plants	3 6
PRIMULA sinensis, choicest red or white, per 100, 10s. 6d.	1 6
sinensis, splendid mixed, including nearly 20 superb varieties	per 100, 10s. 6d.
sinensis, splendid mixed, extra strong plants,	3 6
sinensis, alba magnifica, splendid pure white	per 100, 16s. 2 6
sinensis, Crimson King, magnificent colour	3 6
sinensis, Fern-leaved, choice mixed, per 100, 10s. 6d.	1 6
sinensis, double-flowered, mixed, limited quantity,	4 for 2s. 3 6
FRIMULAS, double, pure white, splendid for furnishing an abundance of cut bloom throughout the autumn and winter. Well rooted strong young plants from 3-inch pots, per 100, 45s.; per dozen, 6s.; 3 for 1s. 9d.	

**DANIELS BROS.,**  
TOWN CLOSE NURSERIES,  
NORWICH.

**ROSES IN POTS;**  
all the best New and Old English and Foreign sorts, from 18s. to 36s. per dozen.

Descriptive List free on application.

**RICHARD SMITH & CO.,**  
Nurserymen and Seed Merchants,  
WORCESTER.

**VANDA LOWI (RENANTHERA).**

A couple of beautiful specimens, best variety, to be sold on account of want of accommodation.

No. 1.—Height of main stem from top of basket, 1 metre 90 cm., from which are five breaks, making in all a total of 103 leaves.

No. 2.—Height of main stem from top of basket, 2 metres, from which are five breaks, making in all a total of seventy-six leaves. Height of baskets 55 centimetres.

Price for the couple on application.

APPLY TO  
"SERRES EXCELSIOR," HAVRE, FRANCE.

**TEA ROSES.**  
GARWAY CO. offer 12 of the above, best named sorts, including MARECHAL NIEL and NIPHETOS, in 5-inch pots, for 10s. cash.  
**GARWAY CO.,**  
Durdham Down, Clifton, Bristol.

**GYPRIPEDIUM BELLATULUM,**  
Rchb. f.

This grand novelty has, on flowering, at once taken the foremost place in the genus, and can be seen in flower at the Clapton Nursery. Fine Plants are offered at

10s. 6d. each; Larger, 21s. to 105s. each.

Also a few extra-sized specimens are for sale.

**HUGH LOW & CO.,**  
CLAPTON NURSERY, LONDON, E.

**FERNS A SPECIALTY.**

The largest, most complete, and profusely illustrated CATALOGUE OF FERNS ever published, containing over 120 illustrations, and much valuable practical information on the cultivation of Ferns, &c. 1s. 6d. post-free. Small Catalogue of over 1300 species and varieties free on application.

**W. & J. BIRKENHEAD,**  
FERN NURSERY, SALE, MANCHESTER.

## WEBB'S SEEDS

From Mr. F. HARRISON, Gardener to the Right Hon. the Earl of Derby:—"Webb's Emperor Cabbage was grown side by side with four other kinds, and was considered to be the best of the lot. It is a grand Cabbage."

**WEBB'S EMPEROR CABBAGE,**  
6d. and 1s. per packet; 1s. 6d. per ounce.  
EARLY NONPAREIL CABBAGE ... 8d. per ounce.  
ENFIELD MARKET CABBAGE ... 6d. " "  
EARLY RAINHAM CABBAGE ... 8d. " "  
RED DUTCH or PICKLING CABBAGE ... 8d. " "

**ONION.** Per pck. Per oz.  
WEBB'S RED GLOBE TRIPOLI ... 6d. 1 0  
LARGE FLAT RED TRIPOLI ... 6d. 0 9  
GIANT ROCK ... 6d. 1 1  
WHITE LISBON ... 6d. 0 6

Free by Post or Rail.

Seedsmen by Royal Warrant to H.M. the Queen and H.R.H. the Prince of Wales.

**WORDSLEY, STOURBRIDGE.**

## ORCHIDS A SPECIALTY.

Quantity immense—Quality fine—Price Moderate.

Inspection invited. 297,300 feet of glass in the Nurseries.

**HUGH LOW & CO.,**  
CLAPTON NURSERY, LONDON, N.

**80,000 CLEMATIS, in Pots, of all the** finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—**RICHARD SMITH & CO.,** Nurserymen and Seed Merchants, Worcester.

## SEASONABLE GOODS.

See the best Catalogue out.

**STEPHANOTS, the freest variety in cultivation, 1s., 1s. 6d., 2s. 6d., and five specimens to 63s. each.**

**ALLAMANDAS, Clerodendrons, Bougainvilleas, Crotons, Gardenias, Ixoras, Passifloras—these and many others, 6d., 1s., and 1s. 6d. each; larger plants if wanted.**

**EUPHORBIA JACQUINLEFLORA and POINSETTIAS, 1s. each, 6s. per dozen.**

**CALADIUMS in great variety, very cheap, 6s., 9s., and 1s. per dozen. GLOXINIAS, 6s. per dozen.**

**GREENHOUSE PLANTS in great variety, 6s., 9s., and 12s. doz.**

**TUBEROUS REGELIAS, coming in bloom, good plants, 1s. each, 10s. 6d. per dozen.**

**GERANIUMS, single, double, and Ivy-leaf, extra fine large plants, of lovely varieties, 12s. and 18s. per dozen; smaller plants, equally good sorts, for winter bloom, 4s. per dozen.**

**FUCHSIAS, Coleus, Heliotropes, Salvia, Abutilons, and other soft-wooded plants, in small pots, 2s. 6d. per dozen; in large pots, 6s. per dozen.**

**FERNS, best kinds for planting in Ferneries or for decoration, in small pots, 4s. doz.; in larger pots, 6s. and 9s. per doz.**

**ADIANTUM CUNEATUM, best for cutting, in small plants, 3s. per doz.; 21s. per 100; in good plants, 6s. and 9s. per doz.**

**TEA-SCENTED and other choice ROSES, in pots, grand plants and finest sorts, either for house decoration or planting in beds, 15s. per dozen.**

**PRIMULAS, CINERARIAS, CALCEOLARIAS, finest strains, young plants for growing on, from stores, 1s. 6d. per dozen, 9s. per 100.**

**CYCLAMEN, young plants, 2s. 6d. per dozen.**

**ORCHIDS in variety, for either cool or warm house, 70s. and 42s. per dozen.**

**TABLE PLANTS in variety, 18s., 24s., 30s. per dozen.**

**BOUYARDIAS, young plants to grow for winter, 4s. 1 s. dozen.**

**PRIMULA ALBA PLENA, the finest for cutting, 9s. per doz.**

**HERBACEOUS PLANTS, planted now in corner of garden, and moved in autumn, seldom die, 3s. per doz., 25s. per 100.**

**ROMAN HYACINTHS, will soon arrive, many thousands already sold, 14s. per 100.**

**PAPER-WHITE NARCISSUS, 9s. per 100.**

**CLEMATIS, 10s. 6d. per doz.; HONEY-SUCKLES, JASMINES, 9s. per doz.; IVIES, 6s. per doz. The best of all time s now to plant these.**

**SEEDS FOR PRESENT SOWING.**

See SEED CATALOGUE.

Wallflower, Silene, MYOSOTIS, Canterbury Bells, Sweet Williams, Arabis, Aubrietia, 5d. and 6d. per packet. Lettuce, Onion, Cabbage, Cauliflower, &c., 6d. to 1s. per ounce.

**PLANT LIST Post-free. BULB LIST ready shortly.**

## THE GARDENERS' CHRONICLE

FOR

Next Week, July 28,

WILL CONTAIN A

REPORT ON THE CONDITION

OF THE

FRUIT CROPS

FOR 1888.

THE

**Gardeners' Chronicle.**

SATURDAY, JULY 21, 1888.

AN AGRI-HORTICULTURAL  
COUNCIL.

**HOME RULE** for England, in a somewhat mild form, is now being discussed, and gradually acquiring shape, in the House of Commons and when the Local Government Bill has been finally "dressed" for third reading and passed into law, there will be Local Councils and councillors enough, it is to be hoped, to satisfy all sorts and conditions of men—and women. What all this legislative power, when thoroughly organised and concentrated, can do, in matters horticultural and agricultural, is not as yet very evident, but that much may reasonably be expected goes almost without saying. Given a well-selected Minister of Rural Affairs, he and a well-organised department may do much in the way of suggestion and otherwise, in conjunction with Local Councils. That such an organisation is sadly in request, not a day passes in which evidence is not forthcoming. Concentration of effort is required in every county, town, and city in the land; and scores of weighty "recommendations," by as many Commissions and Committees of Inquiry, are ready to hand, waiting to be realised. In these Local Councils all the land in the country—arable, pasture, orchard, market garden, woods and forests—will be represented, together with every commercial interest (railways and canals included), if not at the first outpouring of local wisdom, then later on.

But a great central organisation is required to keep all sections "in touch;" to see that there is no lagging behind anywhere; an organisation eminently characterised by widely extending views and unflinching patriotism, whose everyday religion is their everyday work, and who will be amply satisfied, as their reward, with the greatest good bestowed on the greatest number.

Such a mighty organisation, we think, is to be found in an Agri-Horticultural Council—a body made up from the Councils or delegates of the Royal Agricultural and the Royal Horticultural Societies and their committees. On this great

Council every rural element should be represented and commercial. Jibbing on the part of the leading horses attached to the various local "coaches" may surely thus be corrected, and fair work got from every bearer of a collar.

It is admitted on all hands that agriculture must be made more and more of a mixed industry—that much of the food (grain, fruit, and meat) now imported could be as well grown at home as it is in foreign countries—that the millions of money now placed year by year by us to the credit of the foreign producer could, or at least a very large proportion of it could, be retained in our local banks and homely thrifty "stockings"—that much of the over-population of our cities might be prevented by taking back the labourer and his family to the land—from demoralising, filthy city "slums" to health-giving, body-satisfying, rural occupation—possibly much of the flood of emigration stayed, and that the education of children at home (at the expense of the ratepayers) for the special benefit of dwellers in other lands might cease.

Work for such a Grand Council? There are years full of hard work before it, under the guidance of a far-seeing secretary. One subject for consideration would be the action of the existing Land Laws on rural industries in general. A recently issued Parliamentary Return furnishes us with some interesting figures relative to unoccupied arable land and land capable of cultivation. The return is made up to June 4, 1887, and, summarised, the figures show a total of 212 unoccupied arable farms in England, of 20,980 acres; in Wales, twelve farms, of 1326 acres; unoccupied detached plots of land (exceeding 5 acres) capable of cultivation, foot up at 133 in number, of 2969 acres collectively; or a grand total of 25,284 acres!

In contrast with this brief note of "vacant plots" and "farms to let," it may be of interest to summarise the return of "acreage of small fruit (such as Gooseberries, Currants, &c.) growing between trees in orchards, as returned upon June 4, 1887, in each county of Great Britain, in the Isle of Man, and the Channel Islands." The total acreage for England is given as 17,153, for Wales at 71, for Scotland at 1252; or, for Great Britain, of 18,476 acres. To this is added 71 for the Isle of Man, 56 for Jersey, and 9 for Guernsey, &c.

Reverting to the "unoccupied land" return, some of the remarks made by the Editor of the valuable document quoted from, may be cited with advantage. He says:—

"The broad fact shown in the return for 1887 of a diminution of 48,533 acres, as compared with that obtained in 1881 in uncultivated land in England and Wales, appears at first glance irreconcilable with the undoubtedly intensified depression in agriculture which is generally believed to exist at present in a more acute form than has been known within recent years. There is, perhaps, a slight tendency to exaggerate the extent of land out of cultivation; but, assuming that the principle of including only such land as was actually uncultivated was closely adhered to in 1881, and as carefully considered by the returning officers of that date as it has been this year, the facts remain, and the solution must be looked for in the circumstances attending each of the two periods in question. The replies to a memorandum addressed to collectors, calling their attention to the results shown, and requesting that the accuracy of their returns of 1887 might be further investigated, appear to leave no doubt on this point, for in those counties where the acreage of unoccupied land now shown is less than in 1881 the figures given in 1887 have, so far as it was possible to test them, been found correct, while there appears to be no reason to suppose that those of

1881 were otherwise. It is suggested in the explanations of some of the officers that in 1881 the existing depression in the farming industry was less felt, and that landlords had not then resolved upon reducing rents or taking farms into their own hands for cultivation, notwithstanding the number of holdings which had become vacant immediately prior to the date of the return in 1881; and that many such farms were for a time allowed to run waste owing to owners being reluctant, probably from regarding the depression as temporary merely, to re-let them at reduced rentals, and unwilling themselves to occupy and cultivate them. Owners of land are now, it is mentioned, either partially or completely cultivating land which is at present untenanted, or they have felt compelled to make very material reductions in rents, and, as a consequence of these altered conditions, the quantity of unoccupied land, which in very many cases has been re-let at a merely nominal rental, or sometimes on payment of the tithes only, has actually decreased."

We extract the following "averages of a certain series of years," from an extended return of the "proportional value per head of the population of the several principal kinds of agricultural food products, comprising corn, flour, meal, fruit, vegetables, sugar, live and dead meat and other provisions imported into the United Kingdom from foreign countries and British possessions in each year from 1866 to 1886 (inclusive)." Total No. 1, represents "farinaceous substances;" No. 2, "other vegetable produce;" No. 3, "live and dead meat;" and No. 4, "other animal produce":—

Yearly Averages.

Years.	Total No. 1.	Total No. 2.	Total No. 3.	Total No. 4.	Grand Total.
	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>£ s. d.</i>
1866-70	25 8	11 9	5 1	7 8	2 10 2
1871-75	33 5	16 1	8 0	9 11	3 7 5
1876-80	37 8	18 1	12 3	12 4	4 0 4
1881-85	33 3	17 1	13 11	13 4	3 19 7

A very pretty sum would be the result of multiplying the value per head by the total of the population.

Scores of subjects will readily suggest themselves to the reader as well suited for the consideration of the suggested Council. A far-seeing, quick-witted, energetic Secretary would soon find work enough and to spare; and he would soon prove to the nation at large that all possessed of the franchise are also entitled to subscribe towards clearing the expenses of the work done in the nation's interest, either as members of the great societies whence it is proposed to draw the Council, or as simply interested in the benefits to be derived from perpetual agitation. Surely also the societies representing the greatest of national interests are entitled to a free "home," such as other societies have—at the nation's expense. In other lands which we are sometimes pleased to consider infinitely less important than our own, such societies as those here concerned are most honourably treated and esteemed—a wonderful contrast to the treatment afforded to the Royal Horticultural Society by the Commissioners of the 1881 Exhibition. The time must come—its distance may even now be measured—when Agriculture and Horticulture, working amicably because interestedly together, will receive fitting recognition at the hands of Government. The new Minister—when appointed—will find this "home" question a "burning" one—he might even see his way to have the "home" located, after all, at South Kensington!—a fitting sequel to the story told in the last report of the Royal Horticultural Society.

We confidently leave this subject of an Agricultural Council to the consideration of the millions so very deeply interested in it.

## NEW OR NOTEWORTHY PLANTS.

### THUNIA MARSHALLIANA TRILOBA, *n. var.*

MR. B. S. WILLIAMS has kindly sent me this excellent variety, which has a very broad, really abruptly trilobed lip, with dark reddish-brown veins, and twelve darker rows of processes of crests. I have to add, that I was aware of the description of Thunia nivalis when describing Thunia candidissima. Impossible to judge it, when there is not a word said as to the spur or the crests. Such descriptions become an intolerable nuisance. Thus I cannot name a beautiful variety of *Aërides odoratum* which may be *Aërides odoratum purpurascens* poorly described, but which may be quite distinct from it. *H. G. Rehb. f.*

### THUNIA MARSHALLIANA PURPURATA, *n. var.*

This is a fine variety coming rather near to triloba, but not so much trilobed, though the lip is very broad. The superior half of the lip is pure white with five yellow keels running across the disc. The anterior part having numerous bright purple nervations outside, viz., on the sides covered with yellow filiform processes. The middle is nearly white with very numerous yellow filiform processes. The fringed and wavy border is of the purest white, which affords an admirable contrast to the large purple spots, the numerous purple nervations giving the effect of spots at a distance.

It was kindly sent me by Mr. B. S. Williams, my assiduous correspondent for nearly a quarter of a century. It was obtained from W. E. Brymer, Esq., Ilington House, near Dorchester. *H. G. Rehb. f.*

### HELICHRYSUM DEVIMUM, *n. sp.\**

A bush between 2 and 3 feet high, with scented flowers that appear in April and May. The leaves, which are not in the least viscid, are usually crowded towards the ends of the stout branches. They are from 40 to 70 mm. long, and from  $\frac{1}{2}$  to  $\frac{3}{4}$  times longer than broad. As in the case of *H. melanophthalmum*, the black discs form a strong contrast with the white scales and peduncles. The cymes rise well above the leaves. From *H. melanophthalmum* (Lowe) this plant differs, *inter alia*, by having the leaves sessile, semi-amplexicaul, three-nerved, with greyish-green surfaces, and white irregularly sinuate borders, in place of stalked, oftenerved white, very entire leaves; also by having the tips of the outer scales broad and semicircular, and the receptacle without a central papilla. When specimens of the two plants are placed side by side, the difference in their appearance is at once seized by the eye.

*H. Monizii*, Lowe, has scentless flowers, with brown discs, and the scales, at first green, become chestnut-brown, edged with purple, the tips being scarious and colourless. Moreover, *H. Monizii* has stalked leaves and smaller heads.

The plant now described was discovered by Senhor J. M. Moniz, the well known botanist of Funchal, growing in tolerable abundance upon the barren islet at the eastern extremity of Madeira which bears the name of Ilheo Vermelho or Ilheo dos Embarecadores, and I am indebted to him for the specimens from which this account of it has been drawn up. *J. Y. Johnson, Funchal.*

\* Shrubby, branching, bushy; branches densely tomentose, snowy-white; leaves sessile, semi-amplexicaul, lanceolate, narrowed downwards, with greyish-green surfaces and white somewhat sinuate borders; distinctly 3-nerved. Heads hemispherical, broader than high, peduncles distinct, stout, snowy-white, in few (10-30) flowered, terminal, often compound cymes; scales lax in few rows, outer ones opaque, white, often pale brown below, not shining, without scarious tips or borders, ovate, broadly rounded above, sometimes toothed or laciniate; inner scales oblong, brown or purplish along the middle. Disc black; receptacle slightly convex, without a conical papilla at the middle, rough, with umbilicated discs. Pappus shorter than flower, closely echinate, not clavellate. Achenes dark brown, four angular truncate, sprinkled all over with white resinous particles. *J. Y. Johnson.*

## THE SEED TRADE.

WHICH IS THE EARLIEST PEA? ROUND-SEEDED VARIETIES.—At their new trial grounds, Springfield, Chelmsford, Messrs. Hurst & Son, of 152, Honnditch, have endeavoured to answer this question. The lease of their Croydon ground having run out, this enterprising firm thought it wise to go farther afield, and they have secured some good land for the purpose at Chelmsford, by the side of the Great Eastern Railway. It is a stronger and more holding land than the lighter soil at Croydon, and in course of time, when it, becomes better tilled, it will grow vegetables to perfection. Already the crops of Peas, Lettuces, Onions, Cabbages, Beans, &c., together with innumerable samples of flower-seeds, can be seen to the best advantage.

But which is the Earliest Pea? I think that a thoroughly good stock of Dillestone's Early Prolific, which is but a selection from the old Sangster's No. 1, still holds its own in the race for earliest, though it may be met with here under several different names. A good selection of this type possesses two advantages—it is both early and hardy—and if the cooked Peas lack the finer quality of some of the second early types, yet it is something to have Peas early, and we are not so particular as to quality early in the season: the fact that they are young fresh Peas, and can be had early, leads us to overlook failings in quality; when we get on to the second earlies we can afford to be more exacting on this point.

What is known as the Extra Early of the Americans, and the Improved Sangster's No. 1 of Hurst & Son (a very fine and true stock, indeed), appear to be one of our very best early Peas. Of the round-seeded type there were eighteen rows of the latter—as level, uniform, and true as a set of ninepins. Sangster's No. 1 is a Pea that requires constant and persistent selection to keep it thoroughly uniform and good. What was growing here as Carter's Lightning is represented by a tall stock of Sangster's No. 1—much taller than the improved type, and decidedly later.

Emerald Gem is a good selected stock of the old Danecroft Rival, a good hardy variety, and, when growing, identical in appearance with Sangster's No. 1, only that the foliage, pods, and Peas are green. But there are some who think it distinct from Sangster's in all respects. After all, I suppose that Laxton's William I. remains the most useful of all that Mr. Laxton has raised: its long curved, well-filled green pods, with a pleasing bloom upon them, are decidedly attractive, and while of acceptable table quality, it is also useful for early exhibitions. But it is a variety that seems to show a tendency to run back to the old Prizetaker, which was probably one of its parents, and so a rigid selection is necessary. But of several samples seen here, Hurst's stock of Improved William I. stood out from all the rest for high-class quality. It is the practice of the firm to grow an acre of a very fine selected stock for seed purposes every year, and the produce is sown for a business supply. It is in this way that a good stock is kept pure and true. Laxton's Early William appears to be identical with Improved William I., both in the character of the growth and dried seeds. Veitch's First Early, blue seeds, Harrison's Eclipse, Laxton's Earliest of All, Carter's Blue Express, and Alaska, may, in the general character and similarity, be set down as blue forms of Sangster's No. 1—but good stocks of it; there were seventeen rows of them, and they were all of one type. Kentish Invicta appears to be the same in all respects, only that it is a little darker in the foliage.

I think that the old Berks Gem, or in its more modern form, the Improved Tom Thumb—the latter being both earlier and better than the old type—to be a Pea well deserving of culture for early work, and especially for growing in pots, or sowing in early warm borders; it produces good sized pods for so dwarf a plant, and is a good cropper also. Blue Peter is of the same character, but has darker pod and foliage and larger Peas; the dry seed being blue in colour. First Crop Blue is a large blue round-seeded Pea, a little taller than Tom Thumb, bears

fine pods, and comes in with the first earlies; it is a capital Pea, well deserving of a much more extended culture.

In Pride of the Market we get a very robust growing and free-branching dwarf Pea, about 18 inches in height, and one that will grow very strong in good ground. It does not come in quite with the first earlies, but it is an excellent Pea for small gardens. It has round seed, while its twin brother Stragham has wrinkled seed. Early Kenilworth is a kind of pale-podded William I., taller growing, and not quite so early; Scimitar, a desirable variety, and showing a tendency to run out to a tall type. As seen here it is decidedly inferior to William I.

So far I have dealt with the early round-seeded varieties. The early wrinkled types shall be dealt with next. R. D. [It is interesting to note that these results do not agree with those obtained by Messrs. J. Veitch & Sons, in the case of the same Peas grown on other soil, and noted in our report of the meeting of the Royal Horticultural Society on the 10th inst. Ed.]

## ANNUAL LIFTING OF DAFFODILS.

In your issue of the 7th inst., p. 11, I see Mr. Jenkins refers to some remarks made by me some time ago at the Horticultural Club on the above subject. Politicians claim allowance for after-dinner remarks; I do not know if florists are allowed the same privilege: if not I think they ought to be. Further, it would be impossible for any one leading off the debate on any subject at these meetings to verify all the statements he makes. He ought to be brief, so that the other members present may have an opportunity of airing their opinion on the remarks made. I must own the statement with regard to annual lifting caused a good deal of discussion after the paper was read. Now for the part that Mr. Jenkins seems to think is not very explicit, namely, "It will be found that some varieties require to be lifted every year," that is, they do not succeed with me if they remain more than one year in the ground. The second remark, "while others will remain in the same spot for a number of years and do well." The words which follow this remark, "If it were not for the labour and expense I would lift all my varieties every year," meaning that the latter would even do better if lifted annually than if they were allowed to remain more than one year in the ground; in other words, all varieties are benefited by annual lifting, although some more than others. I am well aware that it has not been the custom with English growers to lift their Daffodils annually—but who succeeds by allowing himself to be entirely guided by custom? Experience has taught me that neither the flower nor the bulb of those that remain more than one year in the ground are equal to those replanted yearly; and if any grower will try the experiment of replanting part of his stock for a number of successive years, he will then see the advantage. Take for example a bulb lifted, say in the beginning of July, dried, carefully cleaned, planted by the beginning of August, if examined by the month of October, when it will be found that the fibre will be much deeper in the ground, and much stronger than in the case of those that have not been lifted; hence follows a larger flower and a better bulb at lifting time. This was clearly visible again this spring with *N. ornatus*: the flowers of those planted last year early in August were much superior to those planted in August the year previous. Mr. Burbidge, in your issue of the 14th inst., p. 35, gives very sound advice when he says, "The best plan in practice is to find out the best course to pursue in one's own soil, and in one's own locality," and this is clearly demonstrated when he says, *N. maximus* is the only one which seems to become stronger with him if left undisturbed for three or four years. Now, this is one of the varieties that I always failed with till I commenced lifting it annually. Now I must differ from Mr. Burbidge when he says the real amateur cultivator of bulbs has nothing to do with the storing of bulbs in any shape or form; here I

must again say, that the bulb that has been dried and cleaned will fibre quicker and stronger than a bulb that has not been taken up and replanted. What I strongly object to is, to divide and clean, and then lay up in heaps to get perhaps heated, or expose them in any form; it is then they will deteriorate—there is no fear of any deterioration when they are drying. What I recommend is, to dry them in trays, and plant the bulbs at once after having been cleaned; and if this custom were practised, I have no doubt whatever that the English grower who forces for market would find home-grown bulbs suit his purpose equally as well as those grown in Holland. James Walker, Whittou.

## PLANT NOTES.

## DELPHINIUM ZALIS.

This extremely interesting and valuable acquisition to our hardy perennial plants is now in flower in the Alpine-house at Kew. It was found by Dr. Aitchison while travelling with the Afghan Boundary Commission, and seeds were freely distributed under the name, we believe, of *D. hybridum*. The leaves somewhat resemble those of our common *D. ajacis*, but the plant is most nearly allied to *D. ochroleucum*. It produces a fine spike of 1 to 2 feet in height, sulphury yellow, with a greenish line down the centre of each petal, rather small for a Larkspur, to be in great profusion. The dried flowers known under the name of "Isparak" are treated with boiling water and yield a yellow dye, said to be an important commercial product. In his notes in the *Transactions* of the Linnean Society, Dr. Aitchison says, "This plant forms a great portion of the herbage of the rolling downs of the Badghis. In the vicinity of Guaran it was in great abundance, and when in blossom gave a wondrous golden hue to these pastures. In many localities in Khorassan—about 3000 feet altitude—it is equally common. The flowers are collected largely for exportation, chiefly to Persia for dyeing silk with. They are also exported from Herat through Afghanistan to Northern India, where it is used both as a dye and for medicinal purposes. D.

## CYTISUS RACEMOSUS.

At p. 523 of the last volume I had some notes on this plant and its allies, which I should now like to supplement with the following remarks:—I there pointed out that the plant known in gardens as *Cytisus racemosus* was distinct in certain respects from any wild specimen I had been able to discover, but that it seemed identical with *Genista bracteolata* of Link. There are two figures published of the latter plant which I then overlooked, namely, *Botanical Register*, vol. xxvi. (1840), t. 23, and *Maudslayi*, *Botanic Garden*, vol. v., t. 235. The former figure is unquestionably identical with the Canary Island species called *Genista stenopetala* by Webb. Lindley remarks:—"The accompanying drawing of this rare plant was made in June, 1832, from a specimen communicated by Mr. Young, nurseryman, of Milford, which was unfortunately lost. It had been received by him from Mr. Webb, who had gathered it in Teneriffe, and sent it home under the name of *Cytisus racemosus*. Some years afterwards, upon showing the figure to Mr. Webb, he recognised it as the *Genista bracteolata* of Link, an obscure plant unknown to De Candolle." The latter figure, though with acute leaflets, probably represents the same species, though it more nearly resembles the *Cytisus racemosus* of gardens. Its origin is thus stated:—"The plant was raised from seed by R. Bevan, Esq., near Bury St. Edmunds, under the name of *Cytisus chrysobotrys*, but he is not aware from whence the seed was obtained." The synonym there cited, "*Genista racemosa*, Lindley, *Botanical Register*, 1840, pl. 23," is an error, that plate, as already shown, being *Genista bracteolata*, Link. From the above facts I am now inclined to believe that *Genista stenopetala*, Webb, and *G. bracteolata*, Link, are identical; and that *Cytisus racemosus*, Marnock,

is from the same source as the *Botanical Register* figure above cited is clear from the remarks made under each. So that *Cytisus racemosus* of gardens appears to be derived from the wild Canary Island plant, its present altered appearance being due to continued selection of the most compact forms for cultivation. If this view be the correct one it would add yet another instance of plants long cultivated in gardens becoming, by a process of selection, so different from their wild originals as to be almost unrecognisable, unless some record of their history be preserved. *R. A. Rolfe.*

## ORCHID COLLECTING.

EARLY in 1887 I was up the Irrawaddy on a collecting tour, but more particularly in search of a certain *Dendrobium* which a short time previously had caused a great sensation at home, plants in flower having sold for upwards of sixty guineas each—a wonderful price for an Indian Orchid, though small compared with what some South American species have since realized.

I was staying at a place many miles beyond our frontier, and had determined to remain a few days, as the place was teeming with Orchids. My interpreter succeeded in inducing the head man of the village to come and see me. When he was informed what my business was he seemed considerably astonished; he could not understand what the white man (the first he had ever seen) could want with what he termed "jungle plants." I endeavoured to explain that they were to be sent across the *Kali pani* (ocean), but this was too much for him to take in. I was either humbugging him, or—what was far worse in his eyes—a fool. It took us not only an hour's continuous palavering, but also two or three brass utensils as presents, before I could propitiate his highness. At last I produced my book of drawings, and was careful to first show him the most common kinds, which I knew were to be had in abundance, and then gradually led him on to what I more particularly required, reserving my plate of *Dendrobium* till the last. He recognised many of the others I had shown him, and gave me their vernacular names, and it was an anxious moment for me when I turned up my trump card. Did he know it, or was I again to be disappointed?—for that unfortunate plate had been through the hands of perhaps fifty men of his class without being recognised. My anxiety may be imagined when I state that we had got as far up the river as was safe to venture in these days. The old man looked at it carefully first, shook his head, then a brilliant idea seemed to strike him—had I ever seen the plant in flower myself? Yes. Was the plate exactly the right colour? I looked at it carefully, and at first replied in the affirmative, but, on second thought, I recollected that one of the colours had been rather overdone—a purplish-crimson had been given where a deep pink or rosy-crimson would have been nearer the mark. This was explained to my old friend, showing him from another plate the proper tint. There was no longer any hesitation, he knew it well, and it was plentiful enough, and so it had been for the last thirty or forty miles of my journey. Then why had none of the other men recognised it? Simply because the plate I carried was wrongly coloured. I had wandered through miles of forest myself, and lived in a miserable country boat for upwards of three weeks without any return simply for this reason; and so it is with many of the plates published.

Well, the following morning my old friend returned, bringing upwards of a hundred plants of the true *Simon Pure*. And now to strike a bargain—often not a very easy matter with natives. Money was of no use, for at that time these men did not know its value. I produced a lot of brass utensils, cloths, and other articles that I brought for the purpose of barter, and he set to making his selection from them. In the midst of this laborious task his eye happened to fall on an empty beer bottle. Here was a prize indeed! I noticed the old man's action, and knew at once that he really meant business: he

examined it carefully, and seemed satisfied with the result. Would I give him this in exchange for the plant? Oh no, it was far too valuable. Well, what did I want, then? Simply another hundred plants as good as he had already brought. After a slight demur he consented, starting off at once to bring them in. During his absence several other men came in from his village; as soon as they saw the kind I was most anxious for, and the price for which their head man had bargained, every man started at once to collect them. Here was a good thing certainly; but where were all the bottles to pay for them? The first thing to do was to overhaul my stores. I found I had only thirty-three bottles of beer left. There was nothing to be done but draw the corks and empty their contents into the river. By the following evening every bottle had been battered away, and still more plants were coming in. I showed every article that I had brought for the purpose of trade, but it was of no use—bottles, and nothing but bottles, would they have. Well, I had still seven bottles of whiskey left; there was nothing to be done but sacrifice the precious fluid, and make the best bargaining I could. Here was something new for them, being of white glass, and of course I dilated on their superiority, and they evidently thought so. One enterprising spirit commenced by offering 300 plants for a bottle; this was quickly followed by 350 and at last came a plucky offer of 400. Had I stuck out, I might have got even a better figure, but I knocked the lot down at the price, and the rest were taken up at the same rate. This was probably the first public auction ever held in the kingdom of Ava, now a dependency of the British Crown.

With the assistance of the natives it did not take us long to pack all my purchases into the boat, and being a beautiful moonlight night we started down the river at once. I cannot say that the voyage was a very pleasant one. Being a forced adherent to the Temperance League is anything but agreeable, especially on a river teeming with floating animal and vegetable matter. In due course we arrived in Rangoon without any mishap, and with probably the cheapest cargo ever landed. This is how one of the first shipments of *Dendrobium* were collected and paid for. I have often been up the same river since, and landed at the same spot, where my old friends are glad to greet me—but bottles will not go down with them now. They know the value of our silver currency well enough, and can drive as hard a bargain as any nation I know. *Cook's Universal Tourist Budget, ex Indian Agriculturist.*

## OSTROWSKYA MAGNIFICA.

Dr. Regel did well when he spoke of this as a wonderful Campanulaceous plant. It was collected by Dr. Regel's adventurous son on the high mountains of Chanat Darwas, in Eastern Bokhara, and was described by Dr. Regel himself in a publication not likely to be very accessible to the majority of our readers.\* The plant was exhibited by Messrs. James Veitch & Sons from their nursery at Combe Wood on Tuesday last week, and constituted the most striking feature of the remarkable exhibition of the Royal Horticultural Society on that day. It obtained a First-class Certificate from the Floral Committee, but in the case of an entirely new plant of this excellence a Botanical Certificate would surely have been the more appropriate award. This, however, is a matter of relatively little consequence. The plant amply deserved any award.

It is a hardy perennial with tuberous roots. As shown the stem is about 3 feet in height, green, sprinkled with small red spots, with four-leaved whorls at intervals. The leaves are glabrous, rather fleshy, shortly stalked, oblong acute, coarsely toothed. The inflorescence is cymose, the flowers

on long stalks, at first pendulous, afterwards nearly erect; when fully expanded they measure  $5\frac{1}{2}$  inches in diameter. The sepals are linear-lanceolate, without appendages at the base, shorter than the bell-shaped, pale lilac, eight-lobed corolla, the veins being of a darker bluish-lilac colour. The eight filaments are dilated at the base, the style beset with collecting hairs, and the inferior ovary deeply furrowed.

The plant, despite a paleness of colour in the flower, is certainly one of the finest herbaceous plants ever introduced, and as there can be no doubt as to its hardiness, and little if any as to its adapting itself readily to cultivation, it is sure to become a popular favorite.

## NAMED GLOXINIAS.

At Messrs. J. Veitch & Sons' nursery recently I noted the following new hybrids, which are certainly improvements on older ones:—*Ivanhoe*, purple, white centre, purple spotted—the flowers have a margin of bluish-white; *The Moor*, deep rich purple; *Rajah*, bluish-purple—large, well formed; *Celia*, purple-white, throat, spotted purple; *Jubilee*, whitish ground, spotted purple, with a margin free from spots; *Cygnets*, white, lilac margin, large open mouth; *Virginalis*, the best pure white flowers—very large and of handsome form; *Delicata*, peculiarly feathered red, margin white, flowers of fine form; *Irma*, scarlet, white throat; *Orestes*, well formed flowers, of a crimson colour, the margin paler; *Cordelia*, large flowers, white, very densely spotted; *Comet*, bright crimson-scarlet; *Sunbeam*, light scarlet, whitish throat. The above gives an excellent variety of colour, and as *Gloxinias* can be easily propagated a stock of them is soon got up. The entire leaves or portions of the leaves inserted in sandy soil will form roots. The cutting pots should be placed in a warm house, and to prevent the leaves flagging too much they are better for being covered with bell-glasses, to be kept close at first, and when it is seen that the leaves are established, a small amount of air may be admitted, gradually increasing the quantity until the glasses may be removed altogether. The sandy soil dries rapidly, and care must be taken to keep it of a uniform degree of moisture, especially first. Small tubers will form at the base of the leaves, and as the leaves, or portions of them, decay, water should be withheld gradually, until they are quite decayed, when it becomes no longer necessary. The tubers will keep well in the dried sandy soil, until it is time to shake them out early or late the following season, according to the time they are required to flower; or a succession may be obtained by their being potted early or late. They are to be seen in their best condition during the months of May and June.

Many persons have an idea that the stronger these and allied plants can be grown the better it is for them, and to that end they set the tubers in very rich soil, whose richness is afterwards supplemented by doses of manure-water frequently applied; but this is certainly an error in culture, and may promote a disease which causes black streaks to appear in the leaves that checks growth. They will make a clean healthy growth in a compost of three-parts fibrous loam, one of light fibrous peat, one of leaf-mould, and one of dried cow-manure, adding sufficient clean, sharp sand to keep the compost open. Each tuber may be potted separately in a small pot; to be repotted again when the plant has grown sufficiently to fill the space with roots. It must be well borne in mind that the plants are not only checked but severely injured if they are allowed to become too dry at the roots. The leaves suffer from the attacks of thrips more than those of any other plant, and generally make their appearance after the plants have suffered a check. I never syringe the leaves, and they seldom suffer from insect pests when grown in the genial atmosphere of a medium hothouse. When the plants are well in flower they may be put into a greenhouse or cool conservatory, where they will stand for a long time in good condition. Those who do not care to grow

\* *Ostrowskya magnifica*, Regel, nov. genus et nov. spec., in *Descript. Plant. Nov. et Minus Cognitarum*, fasc. ix., St. Petersburg, 1884; *Gartenflora*, 1885, p. 125 and 1887, p. 639; *Haage & Schmidt, Catalogue*, 1887, ic. parod. et pessima.

FIG. 6.—OSTROWSKYA MAGNIFICA: A GIANT HARDY BELL-FLOWER: COLOUR LILAC-GREY. (SEE P. 64.)

named varieties, can obtain seeds and raise their own plants; and if the seeds are sown early in the year, pretty flowering plants can be obtained by the usual time of flowering in summer. They merely require to be pricked out from the seed-pots or pans and shifted as they increase in size. *J. Douglas.*

## THE ALPINE GARDEN.

### PRIMULA AURICULATA.

A CHARMING Primrose for the open air, where we have found it perfectly hardy, forming pretty healthy tufts, and giving no trouble beyond the necessary occasional watering during hot weather. It was received from the Continent over a century ago under the name of *P. longifolia*, and figured as such in the *Bot. Mag.*, t. 392. In habit as well as appearance it bears a great affinity to *P. farinosa*; the leaves are, however, broader, devoid of farina, the flowers, if anything, larger, and rosy-purple. While *P. farinosa* is found rather difficult to keep in the open air, especially in foggy districts, unless pot culture be resorted to, *P. auriculata* will be found a true perennial, steadily increasing, and never failing with abundance of its charming flower-heads, collected in ball-like clusters. It ripens seed freely, but they do not keep long and should be sown as soon as they are gathered. Native of the Caucasus, flowering April and May. *D.*

### HOUSTONIA CERULEA ALBA.

Few plants, amongst the dwarfer of the alpine at least, afford so much pleasure to the cultivator as the one named above. Where a little shade can be given, either on an east or north exposure, we find the *Houstonia* perfectly at home, flowering so profusely as to injure itself. Indeed, although a native of the warmer parts of North America, it goes through our winters uninjured, unless too much weakened by the cause given above. The type with bluish flowers is, I believe, in cultivation, but in the possession of very few growers, so far as I know—it seems, indeed, to be as scarce as the variety *alba* is plentiful. It is just possible that the typical form changes colour with cultivation in our gardens, and if this be so it will easily explain its scarcity. According to the *Hortus Kewensis* it was introduced to this country over a century ago by Archibald Menzies, and figured in the *Bot. Mag.* of 1797, in the second volume, t. 370. It may be propagated either by cuttings or division, the latter being the quickest, as the divisions form tufty little plants the following spring, flowering all the summer. *D.*

## TOMATOS AT CHISWICK.

The old-Rose house in the Royal Horticultural Society's Garden is this season given up to the cultivation of Tomatos, and will be one of the attractions of the garden during the latter part of the season, when the plants will be in full fruiting state.

We learn that, on the average, the yearly consumption of Tomatos by the Londoner is about 57 lb. 4 oz., that of the Parisian being only 17 lb. 2 oz.; so that we may justly call this a popular vegetable in London.

As the collection under notice contains a large number of varieties, it should be a very interesting one, and a few notes upon them may prove of service to our readers. The Rose-house is a light, airy structure, of about 100 feet in length by 30 feet in width, and contains some 450 plants, planted out in four borders—two on each side of the central walk. The plants are grown with single stems, and trained to stakes about 6 feet in height. The seed was sown early in March, the planting-out taking place about the middle of April. Ordinary garden soil is that used. A capital set of fruit has been obtained, and the plants are in vigorous health.

Amongst all the sorts bearing the name of

Perfection there is a great family resemblance, and of this most useful kind, producing smooth, solid, scarlet-coloured fruits, there are some 250 plants in the collection—a sufficient evidence of the popularity of this particular type. Haw Green Favourite, certificated last year, is a variety worthy of note, being much esteemed at Chiswick.

Horsford's Prelude, another good thing, is an American introduction, and will be appreciated by those who like a somewhat small Tomato. It produces its beautiful deep scarlet fruits in clusters, sometimes numbering as many as eighteen fruits, and bearing to within 6 inches of the ground. The plants are characterised by a stocky and compact habit. Early Scarlet Tennis Ball is a round Plum-shaped fruit, which is produced in clusters—a very free setter; a good sort to cultivate where quantity is a desideratum. Laxton's Open-air, a good early variety and a free setter: and that good-all-round variety, Hathaway's Excelior, also find a place in the collection. Golden Queen is a very fine yellow-skinned variety, certificated by the Royal Horticultural Committee two years ago.

In a lean-to house adjoining is a collection of about fifty varieties, grown in 12-inch and 16-inch pots, and containing some of the newer sorts, which promise well. In this house we noted some capital examples of the Currant Tomato. What a beautiful decorative subject, when ripe, with its racemes of diminutive fruits! *X.*

## SCOTLAND.

### CATHCART NURSERIES.

ABOUT ten minutes' walk in an easterly direction from Cathcart Station, on a considerable elevation, lie the new nurseries of Messrs. Austin & McAslan, nurseryman and seedsman, 16, Buchanan Street, Glasgow. These nurseries, in extent about 40 acres, have been only three years broken in from farm land, and are already fully stocked with forest and ornamental trees and shrubs and fruit trees in variety: Rhododendrons are a speciality. The stocks of every sort outdoors are in capital health, the soil being good, and the atmosphere pure. A very commodious and handsome suite of offices, with dwelling-houses for the leading servants, and a fine block of plant-houses and frames, have been erected within the past twelve months. The houses are well stocked with stove and greenhouse plants, florists' flowers and Orchids, the latter chiefly Odontogloss, all in excellent health and condition. The houses themselves are thoroughly substantial, yet light and elegant in style, models of what plant-houses should be. A very complete collection of hybrid greenhouse Rhododendrons occupies a considerable space in one of the houses, and appears to be making ground rapidly in public favour in the West of Scotland. Altogether there is a pleasing air of substance and thrift about the whole establishment that is cheering to note in an old firm in these days of general change and collapse in the trade. The career of the firm dates from 1717.

### AIKENHEAD.

This, the seat of John Gordon, Esq., is situate about a quarter of an hour's walk from Cathcart Station, which is distant about four miles from Central Station, Glasgow. Lying to the south of the city, in a rural district, the park, which is of moderate extent, is furnished with well-grown plantations and handsome specimens of ornamental deciduous trees in fine health. Rhododendrons are a special feature in the kept grounds. They are not only objects of interest to Mr. Gordon, but are found to be the best hardy shrubs that can be planted in the neighbourhood. The collection, always a good one, has been much increased within the last seven or eight years. The winters of 1879 and 1880 revealed conclusively in this district that the whole Laurel tribe, and most other evergreens, were not proof against such arctic frosts as occurred

in those seasons. Masses of Laurels of great size and density were killed at that time, and have been replaced by masses of Rhododendrons of the best hybrid sorts. Our visit was made at the time they were in flower, and amongst the hundreds of plants blooming abundantly were such brilliant and familiar sorts as Michael, John, and Mrs. John Waterer, Lady Eleanor Cathcart, Everestianum, and many others.

The flower-gardening features include pretty nearly every style, from the ordinary types of bedding to carpet-bedding and picturesque beds, the latter being done with hardy shrubs of contrasting colours and habit, which have an excellent effect in combination with the surrounding flower-beds. Hardy plants of the herbaceous kinds receive a considerable share of the attention of Mr. Hogg, the intelligent and capable gardener.

In the kitchen garden borders were to be seen masses of *Orchis foliosa* and *O. maculata superba*, 2 feet or more in diameter, composed of dozens of plants throwing up their flowers most vigorously. In a snug corner by the door of one of the houses was a group composed of *Cypripedium pubescens* and *C. spectabile*, along with *Tropeolum polyphyllum* and the rare *Lychnis chalcedonica alba*. These already mentioned, along with beds of purple and old Double White Rockets—both the Scotch and French forms of the latter being equally well attended to—will suffice to indicate the opinion of Mr. Hogg as to what really good hardy herbaceous plants are.

The walls of the kitchen garden are well clothed with fruit trees. Plums are plentiful, so also are Cherries, but Apples are scarce, and Pears almost *nil*, owing to late frosts. Peaches on the open south wall are well set, and the trees healthy.

The kitchen-garden contains a long range of rather old-fashioned lean-to fruit-houses, well stocked with Vines and Peach trees bearing good crops. From the centre of this range there extend two roomy span-roofed modern plant-houses, one of which is devoted to *Ericas* of the hard-wooded class, to *Azalea indica*, and to New Holland plants now-a-days so rarely seen, even in large establishments. Here they are done well, and Mr. Hogg, it may be remarked, has won many laurels at the shows in the West of Scotland with this class of plants.

To Orchids there are four or five houses devoted. The collection is young, but in capital health, and contains choice species and varieties of all the popular genera. Some fine forms of *Cattleya Mossiae*, a remarkable variety of *Miltonia Roezlii*, with an enormously broad and long lip, almost pure white; several well-flowered specimens of *Vanda suavis*; *Odontoglossum citrosomum*, and several *Cypripedes*, were the chief of those in flower at the time of our visit. *W. S.*

### CABBAGE COMPETITION.

We learn from the *Kelso* Mail of July 11 that Messrs. Stuart & Mein, seedsmen, Kelso, encouraged by the great success attending the Cabbage Competition which they inaugurated last year, determined to hold a similar competition this season, and accordingly Friday, July 6, was the date fixed for the exhibition. Last year, with a view to demonstrating the superiority of Mein's No. 1 Cabbage as an early variety, the firm offered a premium of £5 for the best pair of hearts grown from seed directly supplied by them, the date of exhibition being in May. On that occasion the prize was won by Mr. D. Inglis, Howick Hall, Northumberland, with two fine Cabbages weighing 8½ lb. This year a premium of £5 was again held out, Messrs. Stuart & Mein being desirous of now showing that their Cabbage was also the best late variety, standing longest without bursting; and hence the reason for the show being held much later than last year. As indicating the widespread interest manifested in the competition, it may be mentioned that no fewer than ninety-one pairs of hearts were sent in from all parts of Great Britain and Ireland. There was a large consignment from the Southern and Western Counties of England;

Lincolnshire and Nottinghamshire in the Midlands also made a good appearance, while Scotch exhibits were received from as far north as Forres. Three lots were also forwarded from Parson's Town, Longford, and Ballymeana in the North of Ireland. The bulk of the lots sent were well matured and generally in good condition, and a number of them were remarkably heavy. The judges were Mr. Waite, nurseryman, Berwick-on-Tweed, and Mr. Elphick, of Messrs. Hurst & Son, seed merchants, London. After going carefully through all the exhibits, they selected a number of the best specimens, and eventually three pairs were set apart, consigned by Mr. W. H. Divers, Ketton Hall, Stamford, Lincolnshire; Mr. James Lockie, Heatherslaw, Cornhill-on-Tweed; and Mr. Peddon, gardener, Scotby, Carlisle. After considering the respective merits of the lot, the judges awarded the premium to Mr. Divers for a pair of hearts of fine form and quality. Originally they weighed 8½ lb. and 6½ lb. each, but when divested of their outer leaves, in which manner they were judged, they together scaled 9 lb. Mr. Divers, who enjoys a high reputation as a grower of Cabbages (having gained great experience in vegetable culture while for many years foreman to Mr. Gilbert, of Burghley), when forwarding his exhibits, wrote as follows to Messrs. Smart & Mein:—"I can honestly say your Cabbage is the best early one I ever met with, and I am acquainted with all the leading varieties." The hearts shown by Mr. Lockie and Mr. Peddon were also of a meritorious description, but neither in form, compactness, nor quality, were they equal to the first pair. Among the heavier of the Cabbages shown were two sent by Mr. E. Rilestone, Truro, Cornwall, which weighed 28 lb., and other two pairs scaled 22 lb. and 20 lb. respectively. Such a competition as the one under notice is singularly fitted to bring forward valuable data as to the adaptability of the particular variety of Cabbage represented to the varying climate and soil of these islands.

## FLORISTS' FLOWERS.

### THE CARNATION AND PICOTEE.

THE Carnation usually comes into bloom out-of-doors about the third week in July, but if we may judge by the appearance of the plants now, it will be August before we shall have much bloom. Those who grow plants in pots can place them in a glass-house, and if well exposed to the light they will be earlier in bloom. When warm dry weather sets in, and the colour of the flower begins to show at the mouth of the calyx, the flowers are likely to be attacked by thrips—at any rate, those which are in pots—and that will sometimes spoil them by robbing the colour of the flower, the flakes and bizzarres suffering most. When the plants are standing in a house fumigation with tobacco-smoke will destroy the insects, and there need be no hesitation in adopting this measure, even when the flowers are fully expanded. It is needless to say that propagation by layering is preferable, but any scarce variety may also be propagated by cuttings—"pipings" as they are termed by the fanciers. The smaller growths are the best for this purpose, and those a little distance up the stems, that cannot be brought down sufficiently low to be layered. These pipings should be planted firmly in pots of light sandy soil, and they must also be covered with bell-glasses, or very close handlights, to exclude air from them, else they will dry up instead of rooting. The glasses should be taken off daily, or at least on alternate days, and the condensed moisture removed with a cloth, replacing them at once.

Seedlings may also be planted out, if the ground be ready for them, and they are large enough. As the beds of last year's seedlings come into bloom, the plants should be examined carefully, and those flowers which are likely to be valuable marked to be grown again. It is one of the most interesting incidents in the life of the florist to watch the

expanding of the blooms on the seedling plants. There are always plenty of blanks, even in the best of seasons, and prizes few; but if care has been taken in the saving of the seeds, some good and distinct varieties will certainly be found amongst them.

### THE AURICULA, &c.

The seeds have mostly been gathered from the plants that were set aside to save seeds from, and this week the whole of the plants will be repotted. Some of the large plants were not repotted last year until the end of August, and this period we found was too late. They did not form roots freely, and as a consequence, the trusses produced the following spring were not so strong, nor were the flowers so well developed. It is during the period between the time of flowering and that of ripening the seeds that the Auricula aphid makes most havoc amongst roots; not that it does any appreciable harm, but one cannot think it is good management to leave it alone. I like to clear it off the roots entirely, and for that purpose all the soil is shaken off, by working it off with one hand, while the plant is held in the other, and its roots in a pail of water. The roots are then dipped in soft-soapy water, and the plant laid out to dry for an hour, and then dipped in clean rain-water to remove the soap. If greenfly be found on the leaves, the whole plant is dipped into the soapy water. We are careful not to over-pot the plants at this late period. A plant that we would unhesitatingly place in a 48 in the spring would now be more likely to do well in a large 60.

Offsets of last year repotted in May should now have a shift into larger-sized pots, the last shift of the season. Those who have saved seeds should sow them at once in pots or pans, placing them in hand-lights in a partially shaded place. Seedling plants should also be potted, so that they may produce flowering plants for next year.

The plants succeed best at this time of the year in frames placed in a northern aspect behind a fence, hedge, or walk. The lights are always removed night and day, except during heavy rains, or when such are expected at night. Alpine Auriculas and the whole of the hardy perennial family require much the same treatment at this season, except that they do well with more exposure. The whole of our collection of these plants is fully exposed to the north and east winds, and they do much better in that way than when sheltered by trees, hedges, or walls. They are not repotted yet, but will be seen to as soon as we can find time to attend to them. I may remark that the Auricula aphid is very partial to the smaller species of alpine Primulas, and when it once gets into a tuft of, say, *P. minima* it becomes almost an impossibility to get it out from among fibrous roots. The alpine Primulas and Auriculas on elevated parts of the rock garden have succeeded admirably this year, and have been greatly improved by a rich surface-dressing where the roots were exposed. *J. Douglas.*

### ALEURITES MOLUCCANA.

In a report on the trade of Tonga, Vice-Consul Symonds says I have called the attention of merchants to the very large quantity of Candle-nut trees that flourish on these islands (*Aleurites moluccana*), the fruit of which is allowed to rot on the ground. Many years ago the German firm of Godefroi exported over 1000 tons of Candle-nuts in the shell, but on the arrival of the cargoes in Europe they were found to be useless, from the fact that the natives had collected all the nuts under the trees, and thus the majority were several years old and contained no kernel.

An analysis of this nut that I have received is as follows:—Oil, 62.180 per cent.; water, 5.000 do.; nitrogenous substances, 22.653 do.; mineral matter, &c., 10.167 do.

With proper management over 200 tons of this nut could be bought annually from the natives. A few local traders have interested themselves in this

industry, and, at their request, I have asked for information relative thereto from the Consul-General at the Sandwich Islands, whence, I believe, Candle-nut oil is exported in large quantities.

The Candle-nut is very largely grown in the Moluccas and most of the islands of the Indian Archipelago, Malay Islands, Cochinchina, as well as in Lower Bengal and other parts of India, West Indies, Mauritius, &c. In countries where the tree is common the oily kernels are eaten after being roasted, the flavour, it is said, being similar to that of the Walnut or Almond. It has been suggested that the seeds would form a valuable ingredient in cattle food if they could be deprived of their purgative properties. Candle-nuts of the value of £700 were exported from Tahiti, in 1875, while in 1876 and 1877 the value of the nuts sent to London from Levuka, Fiji, amounted to £1502 and £3040 respectively.

## BOOK NOTICE.

REPORT OF OBSERVATIONS ON INJURIOUS INSECTS. By Eleanor A. Ormerod, F.R. Met. Soc. &c. London: Simpkin, Marshall & Co., 1888.

The issue of Miss E. A. Ormerod's *Report of Observations on Injurious Insects and Common Farm Pests* for the year 1887 has appeared, and forms a bulky pamphlet of 130 pages. In her preface Miss Ormerod says that the season of 1887 was marked by prolonged heat and drought which was accompanied "by an unusual amount of presence of various kinds of crop-insects, and also by unusual amount of damage from them." A considerable advance was made during the year in lessening the amount of insect attack and in increasing the knowledge of the habits of the insects and of the methods of treatment available. These reports have become so important to market-gardeners and farmers that their advent each year is looked forward to with interest by the most intelligent of our growers of vegetable crops. The subjects treated of in the present report, by Miss Ormerod, comprise Clover sickness, caused by eel-worms, frit-fly (*Oscinia frit*, L.), on Corn, the Hessian-fly (*Cecidomyia destructor*). To this subject, as might be supposed, a great deal of consideration is given. Several other Corn pests are fully discussed. The black Currant gall-mite (*Phytoptus ribis*) is stated to have been very troublesome in many localities. As an experiment in preventing the spread of this pest Miss Ormerod says:—"It does not appear that this *Phytoptus* or gall-mite attacks red or white Currants; therefore (so far as we know) replacing the destroyed black Currant bushes with the other kinds would be of service. Likewise, as this attack spreads to such a serious extent where black Currant bushes are grown together in large areas, as in fruit farming, it might be worth consideration whether growing the different kinds in alternate rows or plots would not be desirable." The concluding articles in the report treat of the slug-worm, of Pear and Cherry sawfly, small Pine sawfly, and Turnip grub.

## VEGETABLES.

### CAULIFLOWER CARTER'S DEFIANCE EXTRA EARLY.

THANKS are due to your correspondent "J. H." for referring to late Broccolis (p. 47). If "J. H." possesses the above-named Cauliflower there will be no gap between the season of Broccolis and that of Cauliflowers—"J. H." having cut his last heads of Broccoli on June 21, and I cut my first Cauliflower on June 28. The Cauliflower seed was sown on February 8, 1888, in boxes placed on the hot-water pipes of a viney where the heat was mild, and when the plants were sufficiently strong they were pricked out in other boxes 2 to 3 inches apart, and left on the pipes for two days longer, so that rooting into

## THE FLOWER GARDEN.

**VIOLETS.**—The Neapolitans and the Russian varieties that were planted out in prepared borders a few weeks ago for flowering in frames in the winter, should be examined, cutting off all runners as fast as they appear, so as to get strong plants for lifting early in October. This point is one of much importance where quality as well as quantity of blooms is required. Stir frequently the surface soil between the plants, keep them free from weeds, and in all cases where the foliage is not of a satisfactory colour apply a light dressing of some artificial manure.

**Antirrhinums and Pentstemons.**—Put in cuttings of all named and any choice unnamed varieties that it is desired to perpetuate. For this purpose use a compost consisting of finely sifted loam, leaf-mould and silver-sand, and choose shoots about 3 inches long, and in a half-ripened state. Remove the bottom leaves and cut just below a joint. The pots, 4 to 5 inches, should be well drained, and after watering the cuttings they should be placed in a frame and kept shaded from bright sunshine till rooted, syringing overhead, occasionally. Pentstemons may also be propagated under handlights on a north border. Florists' varieties of *Phlox acuminata* may also be treated in the same manner. After the cuttings are rooted put the pots in a position where they will get plenty of sun, so as to obtain sturdy plants for standing through the winter.

**Subtropical Plants.**—Soft-wooded subjects raised from seed the current season must have the leading stems tied to stout stakes, *Ricinus*, *Nicotiana*, many of the *Solanums*, and *Cannabis gigantea* being amongst those that will bear no neglect in this respect. Do not make the ties too tight, and see that the lower ones are not cutting into the stems. The last-named species, if planted in groups, will need a certain amount of thinning out, and the strongest side shoots stopping occasionally—i.e., if growing in small beds, and the soil is covered with *Alternantheras*, *Mesembryanthemums*, or other very dwarf plants.

**Hollyhocks.**—Put in cuttings of these, choosing side shoots with a heel, and not too long. Use clean pots, with plenty of drainage and a sandy compost, containing some finely-sifted leaf-mould; press down moderately firmly, insert the cuttings round the sides of the pots, and place them in a frame where they can have the assistance of a gentle bottom-heat; the cuttings must be well shaded till rooted, after which pot off singly and harden in due course. Care must be taken to avoid too much moisture until it is seen that they have taken root, for being of a soft nature they soon damp off in the frames. *J. Horsfield, Heytesbury.*

## THE HARDY FRUIT GARDEN.

**PEACHES AND NECTARINES.**—Trees should now be looked over frequently, and the laterals kept persistently pinched-in on trees bearing full crops. Give the fruit light and air by fastening the foliage on one side, and if a few leaves are removed altogether it will do no harm, provided the trees are perfectly healthy and will not feel the loss of them. Trees carrying heavy crops should be assisted by an occasional sprinkling of guano on the borders just before rain.

**Apricots.**—The fruit is now swelling fast, and the trees should be looked over frequently to see that none of the fruit gets spoilt by being squeezed against wall-nails; at the same time be careful not to expose them fully to the sun. Apricots ripen better and the fruit is finer when it is shaded by the foliage. Syringe the trees two or three times a week to keep in check insects of all kinds, some of which, notably woodlice, harbour in the rough bark of the stems and branches. The last-named predators do a great amount of mischief to the fruit by gnawing it.

**Thinning the Fruits of Apples and Pears.**—The rain, which has fallen heavily in this district, and generally all over the country, has been of great assistance in swelling up the fruit, and in cleansing the trees of insects. Apples and Pears bearing heavy crops may now be thinned of superfluous fruits at once, and by so doing increase the size of the fruits, and also afford the trees a better chance of bearing the following year. When thinning, the depredations of birds should be taken into consideration, as likewise the character of the variety, and it may generally be said that a greater number

of a small variety may be left on a tree than would be the case were the fruits large. Push on with the summer pruning.

**Layering Strawberries.**—Opportunities have been afforded lately on wet days to get the pots filled with soil, so that they will now be in readiness. It is a recognised fact that layering of the plants in pots is the more preferable method, and if layered early, so that the plants get well established before winter sets in, they bear fairly well the first season. Of course runners lifted direct from the ground with a little soil attached to the roots and planted make good plants, but however well they may be attended to, they will not compare with plants that are layered in pots. It is a good plan to begin by partly plunging the pots in the ground between the rows, as this will help to save labour in watering. Select the strongest runners, and pinch off all growths beyond the young plants, and then either peg them to the soil or lay a stone on them to hold them in position till rooted. After the requisite number is layered, continually remove the runners which arise. The forced plants had better be planted at once, the ground being now in fine condition to receive them, and if the balls are soaked a few hours previous to planting, they will not require further watering; but with a view to save labour, should dry weather set in much between the rows with old Mushroom dung, or such-like material. The forced plants of *Vicomtesse Hericart de Thury* should be accorded a nice warm nook under a wall—one facing south would be best. They must be attended to, and well watered during dry weather, removing the runners as soon as they appear; they will then give excellent results in the autumn, when a dish of Strawberries is a luxury. *A. Ward, Stoke Edith Gardens, Hereford.*

## FRUITS UNDER GLASS.

**PEACHES.**—The early houses from which the fruit has been cut should receive all the air possible and the inside borders a good watering every ten or fourteen days. Where any of the trees have not done satisfactorily, or have shown signs of decline, the present is a suitable time to examine the seat of mischief. Choose a cloudy day and cut out a trench to the depth of the border at about 6 feet from the stem, then, with a steel fork, proceed to prick out the soil from amongst the roots, using all possible caution not to damage any of the roots, clearing all the soil away as the work progresses. It may not be necessary to disturb the tree entirely, unless the soil be in a very sour, wet state, and in this case the whole of it should be removed. The drainage should be examined and put in order, no trouble being spared in a matter of this kind, but let the job be done thoroughly. When everything is ready for the reception of the new soil place a layer of turf, grassy side downwards, over the drainage, and then proceed to fill up with fresh compost. This should not be of too rich a nature, else gross growth is apt to be the result. Add a liberal quantity of charred soil and old mortar to the compost—the first to promote the development of fibry roots, the second to aid in building up the stone of the fruit. Fill up the border to within 8 inches of the desired level, and then proceed to lay out the roots which have been disturbed in proper form. Give them a good dusting over with Vine manure and fine soil (the larger proportion charred), and when a few inches of the ordinary compost have been placed over the roots a good watering with tepid water should be given. After this has drained away fill up to the level; shade the trees until it can be seen they are making fresh roots, giving heavy syringings thrice a day.

**Succession Houses.**—Keep the atmosphere cool in houses where the fruit is ripe. See that the border does not become too dry, or the fruit will not hang so long as might be wished, but rather water if there be any danger of it being dry; maintain a dry warm atmosphere in houses where the fruit is ripening; and should the weather be dull and sunless, a little heat in the hot-water apparatus will promote high flavour and finish. See that trees in all stages of growth with crops swelling have sufficient water at the root; and if the trees should be old ones, assistance with weak guano-water should be afforded them. Attend to the tying in of the requisite amount of young shoots; pinch all laterals and strong shoots. Push aside the foliage from the fruit, so as to give the latter all the benefit of direct sunlight. *W. M. Baillie, Luton Hoe.*

## THE KITCHEN GARDEN.

**CABBAGES.**—The earliest sowing should be got in between this date and August 12, the exact time will vary in different localities, and this can only be learnt from experience; but when removing to a fresh place it is well for the gardener to ascertain the practice of those residing in the district. I find August 4 about the best time here in the average of seasons, but as a general rule in late districts the seeds should be sown earlier, and the warmer ones later. It is well to make three sowings at intervals of ten days, and to sow the earliest crop in rows, so that a number of the best plants may be left to mature without being removed. By this means they are ready to cut much earlier in the spring and are not so liable to run, they not suffering any check by removal. Stuart & Mein's No. 1 is one of the best of the early varieties; it also stands longer without cracking than some others. *Ellam's Early* is also very useful for the first sowing; and as a main crop variety *Enfield Market* is excellent. Some seeds of *Red Dutch* should be sown with the second sowing.

**French Beans.**—A few of these should be sown now on a border where they can be covered with a frame in September, thus prolonging the season considerably. *Sir Joseph Paxton* and *Ne Plus Ultra* are good varieties. A few *Chelsea Gem* Peas may also be treated in the same way, and these will prolong the supply after the other varieties are killed by the frost. Both the Peas and Beans should be sown in rows 18 inches apart.

**Chou de Burghley**, sown as previously mentioned for the latest crop, will now be ready for planting out, and although perfectly hardy it is much assisted by a little extra warmth in February, it should therefore have a sheltered position in cold districts—a south border if possible—and be planted in rows 2 feet apart and 18 inches in the rows. Thus treated it will be fit to cut in February and March. It resembles young Cabbages, with the additional recommendation of being much better in flavour.

When lifting the early Potatoes enough roots should be left to come to maturity in order to get some good tubers for forcing next year, as large sets make a great difference in this crop, and it is often impossible to purchase them. I have found *Sharpe's Victor* very quick and useful as a first early outside, but it is not to be compared with the *Ashleaf* for quality. If a few old Potatoes of the late varieties are kept for a time on dry, airy shelves without growing much they will give a supply of new Potatoes at Christmas, if placed in layers of damp sawdust in a Mushroom-house early in September.

**Herbs** of most kinds will now be ready for drying. They should be cut when in flower and dried gradually by spreading them out in a cool and shady position, in order to retain their flavour, and afterwards tied in bunches and hung up in a similar position where they will be secure from dust, &c.

More seeds of *Endive* and some *Brown Cos* Lettuce should also be sown. *W. H. Divers, Ketton Hall, Stamford.*

## TRADE NOTICE.

WE are requested to state that Mr. A. W. Crews, late manager of the Chad Valley Nurseries, has commenced business on his own account, at Gloucester, in conjunction with Mr. A. C. Cox, late of Messrs. Hugh Low & Co.'s nurseries.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.**  
NOTICE to Correspondents, Advertisers, Subscribers and others. The Registered Address for Foreign and Inland Telegrams is  
"GARDCHRON, LONDON."

NOTICE to SUBSCRIBERS and OTHERS.  
Post-office Orders and Postal Orders should be made payable at the Post Office,  
No. 42, DRURY LANE.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### MEETING.

TUESDAY, JULY 24 { Royal Horticultural Society: Scientific, Fruit, and Floral Committees.

#### SHOWS.

TUESDAY, JULY 24 { Carnation and Picotee Society (Southern Section), in connection with the Royal Horticultural Society.  
Tibshelf.

THURSDAY, JULY 26—Trentham.

#### SALES.

MONDAY, JULY 23 { Imported Orchids, at Protheroe & Morris' Rooms.

TUESDAY, JULY 24 { Second portion of the Downside Collection of Orchids, on the premises, at Leatherhead, by Messrs. Protheroe & Morris (four days).

The Gardeners' Orphan Fund.

THE heartiest congratulations are due to the gardeners of this country, and the warmest thanks of the community are due to the officers and committee of the Gardeners' Orphan Fund, on the occasion of the first annual meeting held on Friday last, July 13. Suggested by Mr. PENNY, Mr. CLAYTON, and one or two other gardeners, as an appropriate means of celebrating the Jubilee of HER MAJESTY, the idea was at once warmly taken up by the great body of gardeners, and zealously and efficiently worked out by the committee and the local secretaries.

Where every one who took part may fairly indulge in some complacency at the happy result already attained it is not necessary to specify individuals. The work has been done by the gardening community for a purpose than which nothing can be more meritorious, and the best return they can experience lies in the consciousness of real distress alleviated, real good achieved. No one, a twelvemonth ago, could have foreseen how admirably the gardeners would have pulled together, or could have dared to hope that at the very first election it was found possible to place on the list the whole of the available candidates, ten in number. What this means in the mitigation of sorrow and the relief of need may be readily imagined. What this means as an evidence of co-operation on the part of the gardeners is a subject of great and hopeful significance.

At the same time the sense of responsibility entailed must needs be deep, but if met in the same spirit with which it has been incurred, we do not think any anxiety may be felt in the

future. The gardeners and those connected with them have but to continue to put out their collective strength, and success in the future will grow in proportion to the needs of the case.

The report of the committee and the balance-sheet are probably in the hands of every reader of this journal, so that it is not necessary to reprint them here. The first annual meeting was well attended by the gardeners. The Chairman of the committee, Mr. G. DEAL—to whose business tact, unflagging industry, and genial manner, the Institution owes so much—commented on the report, and explained the several items on each side of the balance-sheet. He thanked all those who had lent a hand in the good work—and this may be said to include not only individuals but all the public bodies and institutions connected with horticulture, not forgetting the "Market Men" and the ever-popular Superintendent of the Royal Horticultural Society's Garden at Chiswick, who has acted as Honorary Secretary.

Mr. H. VEITCH commented on the fact that the accounts had been audited by a professional accountant, and expressed his satisfaction that the expenses of starting the Institution and making it widely known had been relatively very small. Needless to say, the report was received with acclamation.

Some formal business, such as the reorganisation of the Committee and the appointment of officers was then transacted, and after some discussion it was arranged, as we have already said, that not only the six selected but all ten of the candidates were placed on the list. The names of these fortunate recipients of the gardeners' bounty are as follows:—

Emily Mabel Hyde	...	...	245 votes.
Alfred Swabnborough	...	...	171 "
Albert Lacey	...	...	168 "
Emily Smith	...	...	153 "
Ralph Joseph Gardiner	...	...	131 "
Victor Spyers	...	...	88 "
Albert Edward Best	...	...	80 "
William Samuel Stannard	...	...	75 "
Ethel Staples	...	...	29 "
George Smith	...	...	21 "

We may here interpolate that we have received letters from the friends of some of the candidates expressive of their gratitude to the subscribers.

After all this work was got through—and it was by no means light—the members had fairly earned their dinner.

And here another great success was achieved. The large room at the Cannon Street Hotel was filled mainly with gardeners and representatives of all departments of horticulture, about 200 sitting down to a dinner as remarkable for its success as for the happy innovations that were introduced into it. The guests were all in full sympathy with the objects of the Institution, and on the best of terms with each other. The catering was good, and reflected credit on the Manager, Mr. J. A. BENTHER, and the proceedings were enlivened by the singing of Miss MARIE BELVAL and some of her friends, who gave their services, and whose kindness was acknowledged by the presentation to each of the lady singers of a handsome bouquet.

The speeches formed another welcome variation from the ordinary pattern. Assuredly they were of a considerably higher and better type than ordinary after-dinner speeches, and show that some gardeners can use their tongue as well as they wield the pruning knife. Far from being conventional, wordy and discursive they were earnest, significant and straight to the point.

Sir JULIAN GOLDSMID once more proved what an excellent Chairman the Institution has secured,

and the whole affair was like a family party wherein each endeavours to be agreeable to each other and in which the prominent features were sympathy and good fellowship cheered by success and hallowed by the sense of rendering present help to the helpless, and by determination to continue steadfastly in the good work so auspiciously entered upon.

**ROYAL HORTICULTURAL SOCIETY.**—The next meeting in the Drill Hall, James Street, Westminster, will be held in conjunction with that of the National Carnation and Picotee Society on the 24th inst. The exhibits will also comprise Ferns, Selaginellas, Ivy and zonal Pelargoniums, &c.—A meeting of the Fruit and Vegetable Committee was held at Chiswick, on July 9. Present:—T. F. Rivers, Esq., in the chair; Messrs. Lee, Wright, Burnett, Willard, Howe, Smith, Crowley, Cheal, Saltmarsh, and Warren. The collection of autumn sown Cabbages, numbering forty, were inspected, First-class Certificates being awarded to Express, from Vilmorin & Co., an early selected form of the Early Etampes; and to Ellam's Dwarf Early (Veitch & Sons); Myatt's Early Market (Watkin's & Simpson); Early Rainham; Heartwell and Cocoa-nut were approved as good stocks. Strawberries were next inspected, and First-class Certificates awarded to King of the Earlies (Laxton), Noble (Laxton), Countess, and Lucas. Dr. Moreau was approved as a large handsome sort, also Sir Harry, Souvenir de Kieff, and Waterloo. Early Pears were inspected, the earliest types being Carter's Lightning and Veitch's Selected Early, closely followed by Horsford's Free Trade and Canary Bird; selected forms of Kentish Invicta, William I., and Dr. Hogg, of the same earliness, were much approved; and Gradus (Laxton), certificated last year, well maintained its reputation as a large early extremely handsome variety.

**FRUIT CROPS.**—We hope to publish in our next Number the reports on the condition of the fruit crops throughout the country, to be followed shortly afterwards by a number of remarks on the same, obligingly supplied by our correspondents.

**MR. E. R. CUTLER.**—We are pleased to be able to report that the zealous Secretary to the Gardeners' Royal Benevolent Institution is progressing favourably, and that hopes are entertained that he may be able to resume his duties in the course of a week or two.

**PEOPLE'S PALACE.**—We are desired by the Chairman of the above Institute, Sir E. HAY CURRIE, Bart., to state that the show previously announced to take place on August 6 and 7, will not be held.

**NORTHERN FIELD CLUBS' CONFERENCE.**—The first Conference of representatives of the Northern Field Clubs was held at Huntly, Aberdeenshire, on Friday and Saturday, the 13th and 14th inst. There was a good attendance, delegates being present from Aberdeen, Inverness, Nairn, Elgin, Banff, Keith, &c. At the opening meeting, which was largely attended, Professor J. W. H. TRAIL (Professor of Botany, Aberdeen University) occupied the chair, advocating the claims of the various societies, and sketching the work done by them. The Conference was addressed on many other subjects on Friday, and Saturday was devoted to excursions to various places of interest in the neighbourhood. The several leaders of the excursions read papers on the districts visited.

**ALLIUM NARCISSIFLORUM.**—This seems to be the proper name for the plant certificated on Tuesday last week under the name of A. pedemontanum. In the *Botanical Magazine*, t. 6182, A. grandiflorum, pedemontanum, nigrum, and roseum, are given as synonyms of A. narcissiflorum, but the plant figured at the above tab. is said to be A. insubricum (Boiss. and REUT.), a new name given, we believe, because the name pedemontanum had been several

times confused, and to separate that plant from the true narcissiflorum. To this group of large individual flowered Alliums belong *A. macranthum* (BAKER, *Gard. Chron.*, and *Bot. Mag.*, t. 6789), a native of the Lachen Valley, in Sikkim Himalaya, at elevations of 13,000 feet above sea-level. This is a most charming species, with pretty mauve-purple flowers, perfectly hardy in our borders. *A. narcissiflorum* is a Dauphiny plant, while *A. pedemontanum* is a native of Piedmont, with larger and handsomer coloured flowers.

**HORTICULTURAL CLUB.**—The annual excursion, in which ladies are invited to take part, is fixed for Wednesday, July 25. The members and their friends will meet in the first-class waiting-room at Charing Cross (S. E. R.) Station, at 10.15 on the morning of July 25, and will then proceed in a second-class saloon carriage at 10.32, calling at Cannon Street at 10.42, to Tunbridge, where brakes will be in readiness to convey them to Redleaf and Haver Castle, returning to Tunbridge for dinner, at the "Rose and Crown" Hotel, at 6 o'clock precisely, whence they can return to London at 7.35. Further particulars may be had from H. HONYWOOD D'OMBRAIN, Secretary, Westwell, Ashford, Kent.

**ST. SWITHIN'S DAY.**—The 15th of July will long be remembered as one of the wettest of St. Swithin's Days on record about London. It rained fully twelve hours without cessation, and towards the evening it resolved itself into a perfect down-pour. The soil was literally soaked, the trees washed beyond all previous July experience, and the Apples—what there are—were cleansed by ablutions far in excess of the requirements of the case; for, to accord with the water used, the crop should have been fifty times as large. If what is standing does not become remarkably fine in the autumn it will not be for lack of moisture at the tree roots. It is worthy of note, however, that the trees so far have not made growth in excess of what was made by this time last year. If we get a fine warm autumn, not only should the fruit be fine, but there should be a wonderful swelling up of fruit spurs for another year.

**FUNERAL WREATHS.**—The last number of the *Gartenflora* gives a series of illustrations of the wreaths forwarded by various illustrious personages on the occasion of the interment of the Emperor FREDERICK. For the most part they seem to have been sufficiently ugly, lacking in taste and refinement. Oddly enough, a wreath sent by King GEORGE of Tonga seems to have been the least objectionable of the whole. It consisted of a leaf of a *Latania* as a background, on which was placed a bouquet loosely arranged and surmounted by an imperial crown. Obtrusive ribbons form a prominent feature of all the designs.

**NANODES MEDUSÆ.**—Mr. J. CARVILL writes:—"A very fine specimen, with thirty flowers, of this most peculiar Orchid, is now flowering in Mr. BREESEMAN'S collection at Paragon House, Blackheath."

**TREE GUARDS IN SHEEP-RUNS.**—Mr. Sidney Ford, of Leonardlee, made at the recent meeting of the Fruit Conference committee the interesting statement that the best form of tree-guards in orchards and fields where sheep feed, was found in loose coats of stout mesh wire, 3 or 4 feet high, fixed securely yet loosely round the stems of the trees. Against these the sheep would rub and the guards would revolve with the friction, until the animals, soon tired of the operation. The wire is cheap and enduring, and would prove a protection also against ground game.

**TABLE DECORATIONS.**—The following note, extracted from the *Queen*, may prove serviceable to some of our readers:—"Beautiful have been the flowers at the dinner parties. Mrs. Pattison showed what a great effect could be produced by foliage of rare kinds, set in silver stands. Alpine Poppies have found favour with Mrs. Newgate, at Prince's

Gate; Mrs. Rickards, in Cavendish Place; Mrs. Dimsdale, in Palace Gate; and with Countess Rosse, at the pretty dinner she gave last Saturday; the Duchess of Leinster, the previous day, chose similar flowers, which were placed in silver bowls, with the Directoire wreaths, on the table. Mrs. Gwynne Holford had them in silver bowls and stands. Mrs. Dennistoun placed hers in a notably handsome gold service, and Mrs. Johnston Foster, in Chesterfield Street, in silver baskets, with crescents and Directoire wreaths on the cloth. Mrs. Naylor Leyland carried out the original idea of a green velvet cloth, with the alpine Poppies upon them in glasses, and arranged as wreaths—a triumph of colour. The Countess of Kimberley displayed them in fine Rose du Barry vases. Mrs. Dennistoun, of Golfhill, placed the alpine Poppies in a gold service, giving a posy of Roses to each lady. The Hon. Mrs. Oliphant had trelliswork baskets of the Poppies. The Shirley Poppies are, perhaps, newer. Mrs. Van de Weyer gave a most enjoyable dinner on Tuesday, and her table decorations were particularly admired, with these Poppies placed in gold baskets. Mrs. Phelps also showed them to the best advantage in baskets, and Mrs. Akers, in Hyde Park Terrace, enhanced the beauty of a very fine service of plate with these same Shirley Poppies. Mrs. Ambrose Ralli had them arranged in innumerable devices, and Mrs. Turner in wreaths and crescents. The June Roses were especially beautiful. Mrs. Dunsterville displayed blush and yellow Roses on her table, in silver baskets and in wreaths, and no flower makes such perfect wreaths. Mrs. Siltzer, in Cromwell House, had yellow shaded Roses, which loaded the air with sweetness. Lady Constance Gore, in St. George's Place, had a table of pink and yellow Roses, the combination which Madame La Valiere loved so much. Mrs. Whish mixed red and pink, and Mrs. Henry White, black, red, yellow and pink Roses, the former being, of course, extremely rare, but adding mightily to the effect. Miss Monk, at Buckingham Gate, had red Roses. Mrs. Russell Gole, pink and yellow Roses. Mrs. Montagu again had another variety, the finest shaded Roses in silver baskets, which were interspersed with wreaths on the cloth. Mrs. Arthur Wilson celebrated her silver wedding by a large dinner party, when each guest received either a *bouquet de corsage* or a boutonhole of Devonian Roses, matching the blooms placed on the table in silver bowls. Mrs. Estcourt started a pretty generous fashion; her table was arranged with branches of Catherine Mermet and Maréchal Niel Roses, so that they might be worn afterwards by the guests. Mrs. Peebles, on Friday, displayed pale pink and yellow Roses; and Countess Cadogan, on Monday, had shaded Roses, which were laid on the cloth. Mrs. Powles intermixed fairy lights with her Roses. All white flowers are now much used for the decoration of dinner-tables. Lady Burton had quite a country rustic bouquet in her amalgamation of Forget-me-nots, white Poppies, Marguerites, and other wild flowers."

**RALEIGH.**—Attention is this week turned to the memory of a great national event, which we all, even as children, learned to look back on with pride. So familiar to us are all the incidents that history has preserved, that we hardly realise the gap in time between the 1815 Waterloo and the 1858 Armada. LUCAS' ideal picture of the "Game of Bowls on the Hoe" is as fresh to us as a sketch from "our special artist" of an illustrated paper at Burmah or the Cape, and we almost in the intervals forget what our living friends, wearing V.C.'s, did in the Crimea. We feel we have given the last honours in funeral rights to the Elizabethan heroes in our own lifetime. Happily one part of the Plymouth programme is the game of bowls; for our warriors then were not always leading troops in Flanders or running little ships against Spanish galleons in Mexican waters. They had their periods of rest from fighting, though fighting then, ashore or afloat, occupied so much time. And it is pleasant for those of us who enjoy the pleasures

of cultivating trees and flowers to remember how the peaceful times—times to be reckoned only in months and weeks—of one of the most prominent men of ELIZABETH'S Court were passed. RALEIGH, who has been so misrepresented in history—who has been called an upstart adventurer, while his family connections on both sides were of the highest in the country, who had relatives at Court long before the apocryphal cloak incident—was, though a warrior who had served abroad, a fore-thinking colonizer, a courtier, a scholar, and a statesman. He was also a naturalist, and while the bunting is still flapping in the Plymouth breezes to remind us of cannon and sword point, we may turn to this side of his life with a calm pleasure. Those who have had the good fortune to visit away a lazy holiday near Budleigh, on the South Devon coast, where his boyhood was spent, can have no difficulty in understanding his keen appreciation of natural beauties. The woods, the flower-decked banks, the hedgerows, attractive with insect-life, and the sea-shore, with its many voices, from those of gentle murmur to angry storm, all spoke to him before he went to Oxford to pass on to his duties as a man in troublous times. And all through his life we can trace this influence. Was ever man more called on to show his many-sidedness than RALEIGH? There have been his equals, but few his superiors, in this—yet, if it be that we read him rightly, in his times of repose he enjoyed natural beauties. His idea of the planting of Sherbourne is an illustration of it. Even in his account of his exploration in Guiana, where he was occupied with the care of his men, and noting the course of rivers and the position of hills, he breaks away to speak of verdant plains and "deer trooping down, as if called by a keeper," notes the trees he sees, and speaks of the plants new to him as "enough to fill ten herbaria." So keen was his eye, that on his second visit to Guiana he noted the "change in habitat" of plants. We revere writers like HERODOTUS and PATAENIUS who have told us what they saw, but RALEIGH stands as one of the first who used his pen as an artist would his brush to give us glimpses of beautiful scenery abroad. Botanists will ever be thankful to his memory for having sent so accomplished a scholar and naturalist as HERIOT to Virginia—HERIOT'S report stands as the prototype of reports by naturalists "attached to expeditions." That RALEIGH introduced Tobacco and the Potato we know is mere fable, but he will always be remembered as the first Englishman who sent a naturalist abroad to report on the flora of a country intended to be a colony. May he have a memorial not only among his comrades-in-arms, but also in our Imperial Institute as the first Englishman who with careful foresight thought of colonisation.

**THE MUMMY PEA.**—Every year we receive specimens of a Pea in which the stems are more or less flattened into a riband-like form, and twisted spirally. There is a nonsensical story of its having originally been derived from seeds found in the wrappings of a mummy. A better designation is Crown Pea, as, owing to the distortion of the stem, the flowers and buds are often collected into a sort of crown at the ends of the stalks. The case is interesting as showing that a particular monstrosity can be reproduced from seed. A figure of this Pea was given in our number for January 11, 1873, where a full history of the Pea is also to be found.

**LIQUORICE CULTURE IN RUSSIA.**—Liquorice root (*Glycyrrhiza glabra*), which is now but little cultivated in this country, the chief supplies coming to us from Spain and Italy, is said to have become of late an important article of cultivation in the neighbourhood of Batoum. A few years ago its existence was scarcely known or heeded. It is now grown in great abundance at Liakha, in the district of Elizavetopol. The quantity exported from this place in 1887 amounted to 1400 tons, and the average price on the spot of production is about £2 per ton, and at the port of Batoum, properly pressed and packed, it realises over £6 per ton.

## ROOTING OF LEAF CUTTINGS OF SANSEVIERA GUINEENSIS.

The accompanying illustration (fig. 7) was taken from some leaf cuttings which were prepared at Kew with a view to testing them as a means of quickly obtaining a stock of any of the species, all of which are now attracting attention as valuable fibre-yielding plants. The succulent nature of leaves is by no means an indication of their being capable of rooting and producing plants, as anyone who has any experience in plant-propagation well knows. Theoretically we know of no reason why all leaves should not do this, but practically only a comparative few can be made to strike root. When the minute anatomy of the leaf is sufficiently studied, these points may be made clear. The leaves of the *Sansevieria* were cut into lengths of about 2 inches, and planted with the basal end in sandy soil. In about a month they developed roots, and soon afterwards they put forth the long fleshy runner-like stems shown in the picture. Apparently this stem is an elongated bud, with scale-like leaves, which ultimately forms a bud at the apex from which the true leaves are developed. It might have been expected that the leaf-bud would have been formed on the cutting itself. It seems singular that a bit of the leaf of a plant with the habit of a *Sansevieria* would, when treated in this way, form a true stem before it proceeded to develop leaves.

## HOME CORRESPONDENCE.

*Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

*Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.*

**A LARGE LILIAM AURATUM.**—The Countess of Dartmouth had presented to her in the spring a large pot of *Lilium auratum*, which, when received, was about 3 feet high. There were thirty flowering stems in the pot. There are now 200 open blooms on the plant, not a few of them measuring 8 inches across and 1 foot from tip to tip of the petals. A good many of the stems have eight blooms, while the others have seven. There are still a few buds to open. In all there are 220 blooms and buds. How many bulbs there are in the pot we have no means of knowing as yet. *B. P.*

**BEDDING-OUT COCKSCOMBS.**—In a dry warm season the bedding out of the Cockscomb usually proves a success, but in a dull, cold, unless season such as we are having, with the thermometer down to 37° for a minimum in the middle of July, it is a miserable failure. Last year we tried for the first time the Cockscomb as a bedder, and with excellent results. We only tried one bed, in which there were over 200 plants; the bed was admired by all who saw it. Some of the combs measured 1 foot in length, and were correspondingly broad. I had the idea that a bed of Cockscombs would have a very stiff appearance, but after the experience of last year I have altered my opinion, as the fine foliage the plant took away the stiff appearance of the comb, and the comb showed itself well above the foliage. My employer was so well satisfied with the bed that it was resolved to have a bed in close proximity to the house this year. I had one planted, but the plants do not grow, and they are damping off one after the other as fast as possible, and the few leaves they have made are puny. The plants must be rooted out and the bed replanted with something else. *P. J. B.*

**CANTERBURY BELLS.**—As border flowers these are quite unrivalled for effect, as few plants are so floriferous, and as they grow some 3 feet or more in height and branch freely, producing bells of such a large size and so varied in colour, they make a very fine show. The best and most desirable to grow is the variety known as *C. calycanthema*, which has a salver-like calyx about twice as big as the flower, and this saucer-shaped base is a fine setting off to the blooms. Not only are these Canterbury Bells highly ornamental for border work, where they grow freely and are quite hardy, but they are valuable for

pot culture, as by keeping them under glass during the winter and giving them a little heat in early spring, they may be brought into flower early, when they make a grand display in the greenhouse. As these *Campanula* are biennials it is necessary to sow seed the year before the plants are required, and the sooner this is done the better so as to get them strong, the way to raise the plants being to sow under the protection of a handlight, or in a pan of finely sifted soil, and then place a piece of glass over the top. In either case the handlight or pan should be shaded and the soil kept damp till the seed germinates, when full light and air must be given in order to induce a dwarf sturdy growth. As soon as the seedlings are large enough to handle, those intended for borders should be pricked out in good ground in some nice open spot, and those for the greenhouse potted in rich soil in small pots to be shifted on after, or they too may be planted out with the others, and treated in the same way and lifted and potted up late in the autumn. *J. S.*

### PROFITABLE TOMATO CULTURE IN POTS.

A few weeks ago I noticed in a small span-roofed house at Common Hill, Ilfracombe, a fine example of Tomato culture in pots. The plants being grown in each 14-inch pot, of which there were about thirty—fifteen stood closely together in a row close to the front hot-water pipes on each side, and the plants were trained each with a single stem up to the raters, the shoots and leaves being kept pinched back so as to allow the full benefit of air and sunshine to reach the stems and the numerous clusters of fruit. Owing to Strawberries having been grown on suspended shelves until early in June the leading shoots of the Tomato plants had to be kept stopped hard back until the shelves were taken down, with the result that 60 lb. of fruit were gathered off the plants up to that time, and when I saw the plant (June 21) a like quantity of ripe and ripening fruit could have been gathered. The leading shoot of each plant is now being allowed to reach the top of the house, stopping, however, the secondary growths above each cluster of fruit. Meanwhile a young shoot is taken up from the base of each plant, the points being pinched when about 2 feet high, and afterwards above each cluster of fruit showing on the secondary growths, as indicated. The plants are kept well supplied at the roots with weak liquid manure, and an occasional surface-dressing of Beeson's manure is given before applying water at the roots. I need hardly say that when the crop of fruit on the old stems is ripe the latter are cut clean away, to allow more room for the young plants proceeding from their bases. Thus grown, provided there is a good heating apparatus at command, ripe Tomatoes may be secured from the same pot plants all the year round. The varieties cultivated so successfully by Mr. Dadds, the gardener at Common Hill, are *Chiswick Red*, *Earliest of All*, *Reading Perfection*, and *Main Crop*. *H. W. W.*

**HARDINESS OF CLIVIA MINIATA.**—My experience with *Clivia miniata* being to my mind somewhat remarkable, I am desirous of mentioning it, as it may induce some would-be cultivators of *Clivias* to take the plants in hand for window decoration. The plants noticed were Belgian ones, and came into my hands in the early part of last summer in full bloom, but destitute of all soil at the root. Not having what most gardeners would regard as "suitable" soil, it was put into a carefully-drained pot, the soil employed being that of the back-garden of a house in the suburbs which certainly, a few years ago, formed part of a meadow. The plant after a few days of retirement, spent in a shady corner of a room, was brought into full sunshine at a window facing S.E. It soon appeared to take root, and not a single flower fell from its really magnificent head, which was the envy of my less fortunate neighbours. The roots were greedy of water all that hot summer, but being fleshy they are enabled to hold a considerable store for the use of the leaves, and it was considered good practice to let the soil get tolerably dry before supplying more water. With a little artificial manure I forget whose—the plant made excellent leaves, which grew with decided bow of respect towards the sun, and therefore required a very ready adjustment by making the plant right-about-face. There was abundance of sunlight in 1887, and I looked forward with certainty to a good head of bloom this year, provided the plant did not succumb to frost, the room being unheated, and I had no other with so sunny a window. Water was gradually withheld from September, just enough being afforded from time to time to prevent the appearance of

shrivelling in the leaves. The thermometer must have fallen on many occasions during the winter to several degrees below 32°, for *Maurandias*, *Heliotropes*, *Mesembryanthemums*, &c., were killed by the frost, but the *Clivia* bore the low temperature equally well with *Orange trees*, *Cactus Jenkinson*, and *Adiantum Capillus-veneris*; and in May last it bore as fine a head of flowers as that which came on it from the Belgian nursery. After this experience I may fairly claim to place the *Clivia* amongst the best of our room plants. The foliage is now of a dark green colour, indicating perfect health, and the plant should be rewarded by a shift into a larger pot. The sun-god has been very retiring this season, and by no means brilliant, at least in London; and the crook in the back of my plant is certainly less decided than in 1887—he has "boiled," in fact, much less, so that the right-about-face movement was not so urgent as last year. *M. W.*

### BICOLORS IN SCARLET BROMPTON STOCKS.

The whitening of the flowers of scarlet Brompton Stocks to which Mr. Scaden refers, is far from being uncommon—indeed it is a frequent occurrence. Sometimes the flowers will show a flaked form of white and scarlet; sometimes portions will be white and other portions scarlet. Of course these features are not largely marked, and are most usually found in either the latest bloomers or in plants which may have become partially checked or injured. The suggestion conveyed by Mr. Scaden, that Brompton Stocks at Bournemouth are practically perennials, leads to the inference that that locality must be a paradise for Stocks. The most remarkable fact seems to be, that on the same plants some of the flowers are single and some double. Of such variation on the same plant I never heard before. *A. D.*

**BARREN STRAWBERRIES AND MILDEW.**—Much has been said and written about barren Strawberries, but after all there is nothing remarkable in it, as the barrenness was only brought about by want of strength or development in the crowns, which weakness and imperfection was caused by the great heat and drought of last summer and autumn. In soils that are deep and favourable plants have done well, and in such districts the plants have been free from lack of fruit, but in others, where the land is light and quickly dries, it is only spongy ones, fresh from runners, that had sufficient vigour in them to form flower-heads. What has been a great trouble to us is the mildew, and this we have had both on pot plants and on those outdoors, not only on the leaves, but on the fruit likewise, and it stops the swelling and almost spoils it for use. In houses we could manage to mitigate the evil by syringing with water in which sulphur and soft soap had been boiled, but outdoors little good can be done with this, as it is almost impossible to wet the whole of the leaves. Like the barrenness no doubt the season has had much to do in bringing this mildew about; but I am afraid it is not so easily got rid of, as the spores remain on the foliage or lodge about all the winter. I find that some sorts are more subject to it than others, and *Vicomtesse Hericart de Thury* and *Queens* are the worst. The first-named may often be seen with it, on the seeds, when forced, and it gives a peculiar bloom to the fruit of the *Queens*, which it hardens, and prevents swelling, unless checked at once. Perhaps some one may know of a remedy against this troublesome parasite, and if so they will confer a great benefit by making it public. *J. S.*

**STRAWBERRIES** here are quite a failure this season, whereas last season I gathered upwards of a ton; this year I shall not be able to gather more than about 1 cwt. Seeing Mr. House's advertisement in the *Gardeners' Chronicle*, inviting all interested in Strawberry growing to see his "Victory," I paid him a visit, and must confess I was astonished. He has them growing in different situations, and both in and out of pots; and, without exception, the plants are covered with fruit of all sizes, and the quality has proved to be excellent. The "berry" evidently partakes of the good qualities of both its parents, *V. Victoria*, President and *Earliest of All*. The late runners planted last year had from 8 to 10 good fruit on each, and the old plants one hundred or more. I grow Sir Joseph Paxton, President, Eleanor, and other leading varieties, but have nothing to equal *Victory* in withstanding drought, and for cropping. *J. Toogood, The Gardens, Alwalton Hall, Peterborough.*

**SMUT ("BUNT") IN WHEAT.**—This latter term is not in common parlance in Ireland. There are two kinds, both the production of a parasitic fungus.

Looking through my Wheat crop to-day, I noticed, say 1 or 2 per cent. of the heads black or smutty. This is generated by the fungus *Ustilago*, and as it will immediately be washed or blown away it is not so injurious to the quality of the grain, or, subsequently of the flour, as that produced inside the head later on, and now not easily discerned. This latter fungus is, the *Uredo*—and it is against this primarily the various preventative dips—those dips, are, I believe, a sulphide of sodium or potassium—chiefly are used. I should like, with your permission, to ask as to the life-history of the spores of these parasitic fungi, especially the first—When scattered what becomes of the spores, no Wheat being sown in the same fields for four or five years; and no seed scattered without being first dipped, and then dried out in slaked lime? *W. J. Murphy, Clonmel.* [See Mr. W. G. Smith's *Diseases of Field and Garden Crops.* (Macmillan). Ed.]

**BLIND NARCISSUS POETICUS.**—There is no doubt that the blindness of this valuable variety is this year very general, as shown by recent communications on the subject. It is not easy, however, to trace the cause of this general failure, and the various opinions advanced do not tend to smooth over the too many—serious difficulty. A market grower near by, whose stock of this has been five years planted, estimates his loss of buds at about 10 per cent. The whole of his stock is planted in lines between the Apples and Plums in his orchard; they rarely, if ever, get manure, and the soil, though trenched prior to the original planting, could hardly benefit the bulbs to any great extent, by reason of the traffic to the trees in the fruit season. The soil, too, consequent upon the thick manner in which the trees are planted, must be fairly full of root-fibre, and this upon a soil naturally light with a deep gravelly subsoil would not unaturally point to a dry and impoverished soil. My friend attributes the blindness to wind frosts. In this I cannot agree, inasmuch as we had no wind frost in this locality at the time these went blind this year, therefore, we must look elsewhere for the cause. For myself I had imagined that the excessive drought of the past year or two had not allowed the bulbs to properly mature themselves and this being a late variety strengthened my belief in this direction for the time. This theory, however, is also set aside, for, upon examination at the time, I found mine were exactly like those described at p. 807 by the Rev. G. Wolley Dod; the miniature petals forming a rosette within the scape brown and dead. The flower-stems internally bore every evidence of health so far as my experience would admit my judging. I am now under the impression that heat has something to do with this blindness during the nascent period. I am led to this conclusion by the fact of some of the common *Pseudonarcissus* going blind a year or two since, by an attempt to force them into flower very early in the year. Only a few emerged from the soil while in heat, some of which expanded, but the majority turned brown. The whole batch were eventually turned out-of-doors as worthless, and notwithstanding the weather which followed, a great many flowered at their usual time. The double yellow Daffodils, when subjected to much heat in the early part of the year will also go blind—the blindness in each case becoming apparent when the buds are in the same stage; those that go blind continue erect and never assume the horizontal turn, which is a sure indication of proper expansion. Mr. Burbidge gives preference to annual lifting and a comparatively poor soil, while the soil in Mr. Dod's garden is apparently what Mr. Burbidge would reject. Our soil and the attendant circumstances are distinct again, manure being employed when originally planted, and manure-water applied twice during the past winter; the result being a decided increase in the number of flowers compared with that of last year. Should this blindness be traceable to excessive heat, the difficulty will be overcome by planting in partial shade where possible, or of affording some protection when planted in beds. I have not noticed any sign of the disease till the stems have attained their full height, as they emerge from the ground all equally healthy-looking, while those that fail appear to do so quite suddenly and at one particular stage of their existence. If any readers of the *Gardeners' Chronicle* have well-flowered batches of this variety this year, they will confer a boon to many besides the writer by giving particulars respecting them. *E. Jenkins.*

**NON-WARRANTY CLAUSE.**—I see a notice of the Scotch meeting against the non-warranty clause, reported in the *Gardeners' Chronicle* of last week, and I strongly urge that a similar agitation among

retail-seedsmen and market gardeners be commenced without delay in England. It is contrary to the interests of the public generally that any class should be allowed to set themselves above the law, as the London wholesale trade and certain of their provincial brethren are now doing. It is all very well to say they will meet us in a fair and liberal spirit in case of error, but hitherto most of those who have had occasion to complain—myself included—have been met with the reply, "We state on our invoices we will not hold ourselves responsible in case of failure of the crop from any cause whatever." The only alternative left to us under the circumstances appears to be to buy our seeds of Scotch houses if English ones cannot and will not recommend [guarantee] their seeds. *Market Gardener, Evesham.*

**BROWNIA GRANDICEPS.**—This handsome tree, alluded to in your number for June 16, flowered in the public gardens here a year ago. The heads of flowers were bright red, measured 1 foot across, and attracted the attention of all horticulturists. *Latellier & Son, Cuen.*

FIG. 1.—LEAF CUTTING OF SANSEVIERIA GUINEENSIS.

1, Portion of leaf inserted as a cutting, showing two young plants growing out from base, natural size; 2, 3, 4, Views of same cutting, showing the manner of development of the young plants.

**THE BERMUDA LILY, LILUM LONGIFLORUM HARRISII.**—As a window plant this has often been commended in the *Gardeners' Chronicle*; but really too much cannot be urged in its favour. I have two pots full in my sitting-room windows now expanding into bloom. The height is about 2 feet, and each stem has two immense trumpet-shaped flowers of the purest white, and the scent is most delicious, something like a combination of Musk and Tea Rose. Those Lilies were wintered in 3½-inch pots in a cold frame, and must have often been frozen, and have had no forcing substance, beyond a little guano-water on a few occasions. Owing to their great substance these flowers will remain perfect, when shaded from hot sun, for a month. *W. J. Murphy, Clonmel.*

**WHAT IS A "HERBACEOUS" PLANT?**—After repeated endeavours to answer this inquiry for myself, I am led to seek assistance in the matter. Some years ago I thought that I knew what are herbaceous plants, but to-day I am compelled to confess that the matter is much too complicated for me to attempt to draw the line. In places where one would least expect to find it—as, for example, at the recent shows of the Royal Botanic Society and the Royal Horticultural Society at the Inner Temple—the confusion was heightened beyond measure by the very subjects which did service for herbaceous plants. Naturally enough visitors would imagine when viewing the collections of hardy

plants, that as the schedule provided distinct classes for alpine and herbaceous plants, they were inspecting the one or the other, and not a mixture of both, coupled with "foreigners" which had no right there at all. But while the question may, in many cases, be a somewhat thorny one to decide, there are some points which do not require a moment to decide. When we find our leading hardy plant nurserymen staging such things as bedding Tulips, Polyanthus, bedding Pansies, Myosotis dissitiflora, Harrison's Musk, Saxifraga pyramidalis, and tree Pæonies in the middle of May, as representing herbaceous plants, I think one might fairly assume, that if all these are admissible, what might not be included? Surely if tree Pæonies are allowed to figure as herbaceous, what law can disallow the introduction of a few pot Roses, for example?—or of Azalea mollis, or, in fact, of any plant which is so purely a deciduous shrub, even as are the tree Pæonies? The word "herbaceous" is defined by Dr. Cooke in his *Manual of Botanical Terminology* as "growing as an annual stem from a perennial root," in *Dou's Gardeners' Dictionary* it is given thus: "a plant, the stem of which perishes annually;" and by Chambers the botanical definition runs thus—"having a soft stem that dies to the root annually." By a comparison of these—all agreeing in the main—there would not appear much room for question, if the meaning which it is obviously intended to convey were only carried out in practice. But I very much doubt whether such a plant as Harrison's Musk or Saxifraga pyramidalis could perform the functions set forth by the authorities I have cited. The plant of Saxifraga pyramidalis which flowers this year never flowers again, therefore it cannot be regarded as "producing annual flowering-stems from a perennial root." In this case offsets are produced, which in course of time flower and perish likewise. Were I asked to define this particular plant, I would do so in the words "perennial alpine." Bedding Tulips are quite in their proper place, and fulfil the office of "herbaceous." If a nurseryman were required to supply one hundred herbaceous plants, at, say, the low price of 25s., he must assuredly would not include Harrison's Musk, common Forget-me-Nots, Polyanthus, Pansies, or bedding Tulips, much less Tree Pæonies; therefore I contend that to exhibit all these things in a group provided for herbaceous plants is likely to mislead. In large collections of hardy plants there is no dearth of good things in the month of May, and growers of hardy plants generally, who desire to extend the growing taste for these plants, cannot do better than make their exhibits of them as full as possible of really good, genuine, and useful subjects, at the same time illustrating the value of many of them in the decoration of the conservatory. One word more: very confusing are such things as the herbaceous Calceolarias and Erica herbacea, the former little more than a half-hardy annual, while in the latter we have a dwarf evergreen shrub. Is it possible to classify such as these with what we generally understand as herbaceous plants?—I think not. *E. Jenkins.*

**THE POTATO DISEASE.**—Have you seen anything of the Potato disease yet? Is the anxious query put from day to day by Potato growers. The weather with its very low temperature and daily downpour of rain—sometimes perfect floods of rain—naturally gives ample reason for this anxiety. Rarely has the soil been more thoroughly saturated than it is at the present moment of writing; and the surface is impacted beyond previous summer experience. If there is any virtue in washed air and in cleansed soil, then should both air and soil abound in virtues, and impurities be few in either. But in spite of the Potato haulm looks wonderfully healthy—perhaps never appeared better, for the past three weeks have filled the gaps in the rows caused by the cold which checked leaf growth. The moment sunshine shall rewarm the soil, root development will take place with hasty strides, and the grower will exult in the prospect of a heavy yield. In view of the probability of disease, it would be interesting to know if the earthing system of protection against disease (Jensen's) will be followed by any one this year. It is, perhaps, not too late even now, to put the plan into operation with later kinds, providing the requisite space between the rows has been allowed. As I looked at the cleanly washed ridges of soil about the plants, and the ditch-like appearance of the furrow, I thought that if ever conditions were favourable for a thorough testing of the value of protective earthing they are so at present.

Of course the ridges of soil which are formed under ordinary earthing offer some protection to the tubers from the heavy washing rains, but do not give all that Mr. Jensen requires, and, indeed, what the dangers of the case require, if the spores of the *Peronospora* are really washed into the newly forming tubers from off the foliage, as that gentleman has declared to be the case. But, after all, everything depends upon the presence of the spores, and so far these do not seem to be existent. In some previous years, and under such gloomy weather conditions as now prevail, we have had the disease rampant in the early varieties of Potatoes by this time. Its absence so far may be due to the general lateness of all vegetation, which may also influence the germination of the spores. It is poor comfort to think that. It would be pleasant to be assured that the disease has died out, and that, let the weather be what it will, our crops are safe. That, however, remembering the experience of many years out of the past forty-four, is too much to hope. I confess to having more dread of hot nights and white mists than I have of the plashing rains. The old superstition as to the assumed connection between electrical storms and the *Peronospora* arose from the fact that their during such times, and especially immediately after these storms, is full of humidity—hot steamy humidity. Then with the spores abundant and active, whole breadths have been spotted and blackened after a single night just because the foliage had been saturated in a bath of warm vapour. No protective earthing can check such a disaster as that. We have had none of these conditions so far this year, and for the obvious reason that we have had no excessively hot weather to heat the soil and promote humid exhalations. Should the clouds disappear and the sun show his face for any lengthened period without doubt the soil will get warmed. Our chief reason for hope that the worst may not come lies in the fact that the Potato disease most dreaded has been for the preceding two or three years in a great measure inoperative, and that lack of activity may have materially lessened its powers of reproduction. A. D.

#### Scientific Committee.

JULY 10.—Present: G. F. Wilson, Esq., F.R.S., in the chair; Messrs. Smee, Boulger, W. G. Smith, J. O'Brien, D. Morris, and Dr. Masters.

*Insects attacking shoots of Ash.*—Mr. Boulger mentioned, on the authority of Mr. Stanton, that the insect, alluded to at a previous meeting, was probably one of the Tineidae, *Frays Curtissellus*.

*Plague of Cattapillars.*—G. A. further discussion took place on this subject, in the course of which Mr. O'Brien alluded to the abundance of earwigs (*Forficula*) this season. Mr. Wilson drew attention to the local distribution of the cattapillars. In one garden in his neighbourhood none of the pests were found, while in others there was scarcely a leaf left on the trees. At Wisley, Mr. Wilson had found that exposure to east winds was associated with the presence of the insects; that the trees in one line of Plums, fully exposed, were stripped of their foliage, while in another line of the same variety close by, on the same description of soil, but where the trees were sheltered by a Furze fence, not a leaf was injured.

*Fungi on Cucumbers and on Poppies.*—Mr. W. G. Smith exhibited leaves of Cucumbers affected with the rare *Didymium dedaleum*; and also Poppies attacked by the *Peronospora arborescens*, in consequence of which the flower-stalks were lengthened and spirally twisted.

*Lælia Egermanniana.*—Mr. O'Brien made some remarks relating to this plant, exhibited by Messrs. Sander, which is remarkable for the presence of well-developed leafy bracts (not membranous sheaths) at the base of the flower-stems. By some the plant is considered to be a hybrid between *L. autumnalis* and *L. majalis*. As there was some doubt expressed as to whether the existence of leafy bracts might not be accidental, it was suggested that the plant be exhibited again another year.

*Odontoglossum Eugenes.*—A plant of this was shown, and was considered to be a form of *O. excellens*, and possibly of hybrid origin; *O. Pescatorei* being one of the parents.

*Anthurium Rothschildianum.*—From Messrs. James Veitch & Sons came a plant with two spathe from

the same stock. One of the two was much more densely spotted than the other.

*Epidendrum vitellinum.*—From Messrs. Sander came flowers of this species, in which, although the flowers were not fertilised, the ovary beneath the flower was enlarged, its colour glaucous-green, with six prominent orange-coloured ribs. [Subsequent examination showed that the pollen-masses had not been removed, and that, although the ovary was swollen, the ovules in the interior were imperfectly developed. M. T. M.]

*Delicious Strawberries.*—Mr. Morris forwarded a letter from Mr. Colebrook on the subject of the well-known tendency towards the separation of the sexes in Strawberries, especially in the United States.

*Tomato Disease.*—From the editor of the *Journal of Horticulture* came a letter written by a Guernsey grower detailing the course of this too well-known, or rather these too well-known diseases. The writer's plants were in a span-roofed house, 60 x 25 feet, and were affected last year when sulphur was applied without effect, the leaves were speedily affected but not the fruits. After the removal of the crop the grower took the precaution to have the walls washed with lime, to renew the soil, and adopted every known means to secure healthy growth, but this year the disease is worse than before. One grower was mentioned as having seven houses, each 350 x 45 feet, decimated with the disease and not a pound's worth of saleable fruit in before. Mr. W. G. Smith referred to the full description and illustration of the several fungi known to attack the Tomato given in the *Gardeners' Chronicle*, in 1881, November 12, and in 1887, August 6, October 1 and 29, by Mr. C. Plowright and himself. Dr. Masters suggested the trial of sulphate of copper in fine powder, mixed with precipitated lime, and dusted over the foliage, as used in the French vineyards.

*Monstrous Cypridipediums.*—Various specimens from Mr. Tautz and Mr. Pollett were shown, and referred to Dr. Masters for examination and report.

### CHERTSEY AND DISTRICT.

THE twenty-third annual exhibition of this Society was held, by kind permission of R. Gibbs, Esq., in the grounds at The Hollies, Weybridge, on Thursday, the 5th inst. Considering the inclement weather we have experienced of late, the committee are to be congratulated on the results of their labour, while it is gratifying to learn there is a balance on the right side. Favoured during the afternoon with bright sunshine, the inhabitants of the district came out to see the show and hear the excellent music played by the band belonging to the Royal Scots.

The exhibits were staged in three large tents, and the prizes offered in the various classes were keenly competed for. Amongst the most successful exhibitors were Mr. Sutton, Ashley Park, Walton-on-Thames, who was 1st in the group arranged for effect, the same exhibitor showing well in fruits. Mr. Reed, Broadlands, Oaklands Park, staged some splendid stove and greenhouse plants, his collection of *Euchsias* being very good. Mr. Osman, Otter-shav Park, was well to the fore with black and white Grapes, and green-fleshed Melons; while Mr. Sutton was 1st with the miscellaneous collections of fruit.

### IPSWICH AND EAST OF ENGLAND HORTICULTURAL.

THIS Society held its first annual meeting on Wednesday the 11th in the picturesque grounds of Christchurch Park, which the committee had wisely secured for the occasion, as the park is in close proximity to the town, and no place could be better adapted for holding a *fête* of the kind, as, besides the advantage mentioned, the particular part at which the tents were pitched is well sheltered and lies at a high elevation, and therefore soon dries after even the heaviest rains. This was at once apparent the morning of the show, the night having been rainy.

The principal tent was devoted to plants and Roses, the first-named being ranged down the sides, the Roses in the centre, and nearly filled it, and hardly ever were H.P.'s seen in a greater state of perfection, the blooms fine and massive in petal, and the colours bright and decided, especially the dark flowers. Teas were on the whole good, although, in a few instances, showing signs of injury from wet.

In specimen-plant exhibiting and growing there has been a great falling off of late years, one of the principal exhibitors having left the country, and others appear

to have given up growing for show purposes, therefore the competition in any of the classes was languid, excepting in the groups where the plants are in small pots, which were quite a feature, and here the growers for sale made a good display of useful saleable stuff.

*Open Classes.*—Four stove and greenhouse plants.—Messrs. Gilbert, of Ipswich, were 1st, with a fine specimen of *Erythrina crista-galli*, and one of *Erica Farnesii* rosea. Mr. Marshall, gr. to J. D. Cobbold, Esq., of Holywell, was 2nd.

For six ornamental foliage plants, the above-named exhibitors maintained the same order, the best plants in the winning lot being *Croton Queen Victoria* and *Phormium tenax variegata*, *Asparagus plumosus*, *Phoenix reclinata*; *Dracæna Shepherdii* and *D. Bapstii* being good specimens in the 2nd.

In the amateur class for a group of plants (50 square feet), arranged for effect, Mr. Catlin, gr. to G. Crisp, Esq., Playford, was 1st, and Mr. Marshall 2nd.

For a specimen Orchid, Mr. Rogers, gr. to Lord Rendlesham, was 1st, with an *Oncidium macranthum*, and Mr. Marshall 2nd, with a well flowered *Dendrobium densiflorum*.

For six exotic Ferns the Messrs. Gilbert were to the fore, with fine plants of *Gymnogramma Mertensii*, *Davallia pycnidata*, and *D. Mooreana*; while the 2nd fell to Mr. Marshall. Mr. Crestwell, gr. at Stoke Park, took 3rd for the single specimen. In the class for six hardy kinds Mr. Leatherdale, gr. to F. Nicholson, Esq., came in 1st, with good plants of *Athyrium Filix-femina plumosum*, *Polystichum angulare Wollastoni*, and *Lastrea Filix-mas cristata*.

Amongst the cut flowers Roses, as already mentioned, made a fine display, Mr. B. R. Cant, of Colchester, taking 1st in the open class for thirty-six single trusses, and Mr. F. Cant, 2nd. The blooms most noteworthy in the 1st stand were Countess of Oxford, Heinrich Schultheis, Marie Fingir, Maurice Bernardin, Horace Vernet, Dupuy Jamin, Ulrich Brunner, Mary Bennet, Pride of Waltham, Marie Verdier, Merville de Lyon, and Victor Hugo. Mr. F. Cant had fine flowers of Her Majesty, A. Colomb, Madame J. Perrière, Exposition de Brie, and Baroness Rothschild.

In the open class for twelve triplets the prizes fell to the same exhibitors, and in the same order, the Rev. Foster-Melliar was 1st, with a remarkably fine lot, and he was closely run by the Rev. H. A. Berners, who showed very strongly, and took 2nd. The best flowers contributed by the first-named exhibitor were Madame Verdier, Lady Mary Fitzwilliam, Ulrich Brunner, Harrison Weir, Earl of Pembroke, Horace Vernet, Duke of Edinburgh, Thomas Mills, Marie Van Houtte, and Catherine Mermet.

In the amateurs' class for thirty-six single trusses the Rev. Foster-Melliar was 1st, with a remarkably fine lot, and he was closely run by the Rev. H. A. Berners, who showed very strongly, and took 2nd. The best flowers contributed by the first-named exhibitor were Madame Verdier, Lady Mary Fitzwilliam, Ulrich Brunner, Harrison Weir, Earl of Pembroke, Horace Vernet, Duke of Edinburgh, Thomas Mills, Marie Van Houtte, and Catherine Mermet.

For twenty-four single trusses the Rev. J. Erere, of B. H. Dextery, was 1st; Mr. Palmer, gr. to J. H. Powell, Esq., of Drinkstone, 2nd; Mr. Erere, the Rev. H. A. Berners took 1st; the Rev. Foster-Melliar 2nd.

In the class for twelve Tea and Noisettes the Rev. H. A. Berners was again 1st, and the Rev. Page Roberts 2nd.

For six Roses of any variety, the Rev. H. A. Berners took 1st, with Her Majesty; Mr. Palmer 2nd, with Duke of Edinburgh.

In the class for six distinct kinds, D. G. Orpen, Esq., took 1st. For six Teas and Noisettes, the 1st prize was taken by Mr. Morris, gr. to Miss Penrice.

Herbaceous cut flowers were well represented, the Messrs. Gilbert taking 1st, with a fine stand; and Mr. Cox, gr. to B. Chevellier, Esq., 2nd.

For ballroom and bridal bouquets in the nurserymen's class, the Messrs. Gilbert were 1st; and in the amateurs' the premier prizes went to Mr. Andrews, gr. to the Hon. T. Lowther, M.P.

The stands of cut stove and greenhouse flowers were good, that from Mr. Rogers, gr. to Lord Rendlesham, who took 1st, being specially noticeable for the fine pieces of *Thunia Marshalliana*, *Odontoglossum*, *Pancratium*, and *Epidendrum vitellinum majus*; the 2nd fell to Mr. Palmer, who had the remarkable *Dendrobium Dalhousieanum* and *Sorbaria xantholeuca*.

*Fruit.*—Excepting for Strawberries, which were

good for the season, there was not much competition in the fruit classes, but the collection contributed by Mr. Rogers, gr. to Lord Rendlesham, and who took 1st, was good. The Peaches and Nectarines were very fine and well coloured.

For three bunches of black Grapes, Mr. Rogers was 1st, with nice coloured Hamburgs; and Mr. E. Lewis, gr. to John Limmer, Esq., 2nd—larger bunches, and berries, not so well finished.

For three bunches of white Grapes, Mr. Holden, gr. to A. D. Halford, Esq., was 1st, with good large-berried Buckland Sweetwater; and Mr. Tibbenham, gr. to Lady North, 2nd, with the same variety, almost equally good.

The prize for six Peaches was won by Mr. Rogers, with large highly coloured Royal George; Mr. Chettleburgh, gr. to Col. Rous, coming in 2nd; and the last-named was 1st for six Vitamont Nectarines, and Mr. Rogers 2nd with Elmgro.

Cherries were remarkable for size, Mr. Rogers taking 1st with Tartarian, and Mr. Cresswell 2nd for May Duke, in the class for blacks; and Mr. Cox 1st in the whites, for Gov. Wood, a fine sweet, early sort, and which beat the dishes of Elton.

Strawberries were mostly represented by John Powell, which took 1st for weight and flavour, but why they should have been placed before the Queens was a puzzle.

Vegetables were very fine, especially the collection shown by Mr. Cresswell, gr. to — Charters, Esq., of Stoke Park, who had fine Asparagus, Vegetable Marrows, Tomatoes, Carrots, Sutton's Seedling Potato, and Duke of Albany Peas; and Mr. Andrews, gr. to the Hon. T. Lowther, who took 2nd, had also a very nice lot.

### EALING, ACTON, AND HANWELL.

JULY 11.—A wet morning greeted this, the opening of the first of all the metropolitan suburban shows, in the grounds of the Indian Asylum, Ealing. None the less the show was, in all its departments, a very good one, the entries in excess of any previous year, and the attendance, in attendance of the weather, very large.

The cottagers' exhibits were remarkably good, and comprised 370 entries. The plant groups included a lovely arrangement of golden pyramidal *Celosias*, *Begonias*, *Gloxinias*, *Ixoras*, *Carnations*, &c., sent by Mr. Roberts from Gunnersbury Park Gardens. Messrs. C. Lee & Sons sent a fine collection of ornamental trees and shrubs; a beautiful lot of large flowered and fancy Pelargoniums came from Mr. C. Turner, Slough; a very nice lot of decorative plants from Messrs. Fromow & Sons, Chiswick; and an interesting group from Mr. B. S. Williams, Victoria Nurseries, Holloway. The best of the ordinary decorative groups were arranged by Mr. Hudson, Gunnersbury House Gardens; and Mr. A. Wright, Devonhurst, Chiswick, whose group was exceptionally pleasing and gay. Mr. A. Wright had the best four *Ruchias* in very fine pyramids; Mr. W. Wright gr. to G. P. Greenfield, Esq., Hanwell, coming 2nd, with larger but less perfect plants. Mr. Chadwick gr. to E. M. Nelson, Esq., Hanger Hill, had the best six foliage plants, and the best six flowering plants—Mr. A. Wright having the best single specimen in a good *Bougainvillea glabra*.

Zonal Pelargoniums were in good form and plentiful, the best four being staged by Mr. Davis, gr. to H. G. Lake, Esq., Chiswick, who had Oneida, Henry Jacoby, Sarah Bernhardt, and Rosa Bonheur. Mr. A. Wright had the best six *Gloxinias*, and four fine pyramidal masses. A lovely group of Orchids, sent by G. F. Tautz, Esq., Hammersmith, attracted much attention.

In the cut flower department the Rose competition for twenty-four trebles brought a lot of fine flowers from Messrs. Paul & Sons, Chesshurst; Mr. Turner, of Slough; and G. Prince, Oxford, who took the prizes in the order given; whilst, in the class for twelve Teas, Mr. Prince was a good 1st, Mr. Rumsey, Waltham Cross, being 2nd, and Mr. Turner was 3rd. The local exhibitors made up a big show of Roses also, and Messrs. Veitch & Sons, Chelsea; and Messrs. C. Lee & Sons also staged large and very telling collections. *Gloxinias* in bunches make a lovely class, and here the best came from Mr. Long, gr. to E. B. Bridges, Esq., Acton; and Mr. Eaton, gr. to J. B. Bonnier, Acton, was 2nd. With twelve bunches of stove and greenhouse flowers, including several beautiful Orchids, Mr. Cowley, gr. to G. F. Tautz, Esq., was 1st, Mr. Chadwick coming 2nd, and Mr. Hudson 3rd. Mr. Davis had the best twelve bunches of hardy flowers, whilst Mr. Sax was well 1st with six hardy kinds. Mr. Collyer, gr. to Mrs. Morrell, Ealing, had the best twelve bunches of

zonal Pelargoniums; and Mr. Sutton, gr. to Mrs. Wilkinson, Ealing, had the best twelve bunches of show Pelargoniums. Sweet Williams, Antirrhinums, &c., were also abundantly shown, and in the same tent Messrs. Cheal & Sons, Crawley, put up a very interesting collection of hardy flowers, Roses, &c.

Fruit was shown in great plenty, and was very good also. Mr. Milson, gr. to W. Lindell, Esq., Drayton Green, was placed 1st for an excellent collection of six dishes, and was also 1st in the class for two bunches of black Grapes, with excellent Black Hamburgs; whilst in the class for whites Mr. Wynne, gr. to F. Hicks, Esq., had the best in good Foster's Seedling. The latter was 2nd in the class for six dishes of fruit.

Truly wonderful Strawberries came from Mr. Garlandroy, gr. to Mrs. Field, Greenford, and who showed James Veitch, huge samples and handsome, and very fine Dr. Hogg. Mr. Eaton had the best single dish in good British Queen.

Very fine dishes of Cherries in Governor Wood and Empress Eugénie gained Mr. Chadwick the 1st place with two dishes; Mr. Hudson coming 2nd, with Black Tartarian and Bigarreau, also good. Mr. Chadwick had the best six Peaches in Noblesse.

Amateurs, single-handed gardeners, and cottagers had rare quantities of fruit, all of which it is impossible here to particularise.

Vegetables were so good as to almost give the lie to the assumption that the season is backward. Messrs. Milson, Davis, and Chadwick took the 1st three prizes in the class for a collection of six kinds. Mr. Milson had the best three dishes of Potatoes in wonderfully good Prizetaker, Beauty of Hebron, and Sunday's Seedling; Mr. W. Wright coming 2nd, with dishes of the two former and Early Rose. Mr. Milson was also 1st with six fine Perfection Tomatoes, and Mr. G. Weedon took the 1st place with Telegraph Cucumbers in that class. What exhibition Cucumbers should be was well shown by a couple of beds of seedlings from Mr. Lockie, Oakley Court, Windsor, the fruits being of moderate length, and perfect in form.

Children's collections of wild flowers made a wonderful show. No less than six pairs of judges were needed to get through the immense number of exhibits in competition.

### TUNBRIDGE WELLS.

THE thirtieth annual exhibition was held on Wednesday, July 11, in the picturesque grounds of the Spa, by kind permission of W. B. Dick, Esq. Every preparation had been made for a most successful exhibition; but the day turned out miserably cold and wet. The result, we fear, will be a considerable loss to the Society.

For the best six stove and greenhouse plants in flower, Mr. S. Pope, gr. to J. J. Barron, Esq., Holme-wood Park, took 1st honours, with *Anthurium Scherzerianum*, with over a hundred spathes; *Allamanda Hendersoni*, *Ixora javanica*, *Statice profusa*, *Stephanotis floribunda*, and *Clerodendron Balfourianum*. Mr. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, 2nd, showing good plants of *Allamanda nobilis*, *Statice Butcherii*, and *Ixora Williamsii*.

For six foliage plants, Mr. Pope was again 1st, with good plants of *Pandanus utilis*, *Croton angustifolius*, *Croton variegatus*, *Alocasia metallica*; Mr. Offer 2nd.

For a group of plants for effect—the leading feature (space 17 × 14 feet)—Mr. W. F. Smith, gr. to Mrs. Byass, Nevill Court, was 1st, with a tastefully arranged lot; Mr. Offer, 2nd.

For twenty-four stove and greenhouse plants in 12-inch pots, Mr. Offer was 1st, Mr. Smith 2nd.

For six exotic Ferns, Mr. Pope was 1st, his best plants being *Cyathea dealbata*, *Devalia Mooreana*, and *Microlepia hirta cristata*; Mr. Smith 2nd. A group of Ferns, 17 × 14 feet—Mr. Webber, Tonbridge, 1st; 2nd, Mr. L. Dupond, gr. A. Alchin, Esq., Rustall.

Roses were a grand display. For forty-eight blooms Mr. A. Slaughter staged 1st with very good blooms; Mr. Balchin, Hassocks, 2nd.

For twenty-four blooms Mr. Harris, Horsham, was 1st; Mr. Warde, West Farleigh, 2nd; Mr. R. E. West, Reigate, 3rd.

For twelve, Mr. Harris was 1st, Mr. Steyning 2nd, Mr. Warde 3rd.

For twelve Teas, Mr. Harris was 1st; Mr. J. Dadds, Reigate, 2nd; Mr. G. Bunyard, Maidstone, 3rd.

For six of any one variety, Mr. Ward was 1st; Mr. Balchin, 2nd; Mr. Gorrington, Eastbourne, 3rd.

Fruit was very fine, and for the best twelve dishes

Mr. Hopgood, gr. to Sir Julian Goldsmid, was 1st; Mr. J. Snow, South Park, Wadhurst, 2nd.

For the best three bunches of black, Mr. Duncan Christy was 1st; Mr. Hopgood, 2nd. For three bunches of white Grapes Mr. Harvey, gr. to C. L. Hughes, Esq., Warrington, was 1st; Mr. G. Denton, gr. to A. F. Beeching, Esq., Fercro Hall, Tonbridge, 2nd.

For the best dish of Nectarines Mr. Pope 1st. Peaches: Mr. Hopkins, 1st. For the best Melon Mr. Hopgood 1st.

### CHISWICK HORTICULTURAL.

JULY 12.—It was a remarkably good exhibition, held in the Royal Horticultural Society's Gardens, under the most depressing circumstances, for it rained all day. There were three tents, and the conservatory was also utilised.

Group for Effect.—The leading feature was the group arranged for effect, to occupy a space of 100-square feet, the 1st prize being a Jubilee Challenge Cup, value 26 guineas, presented by Mrs. S. A. Lee, to become the absolute property of the person winning it three times. In addition there was a prize of £4. This was won for the second time by Mr. William Brown, St. Mary's Grove Nursery, Richmond, who had a charming group in perfect taste. There was a carpet of Maidenhair Ferns, rising from which were Orchids, richly coloured *Crotoms*, small Palms, &c., with a background of elegant Palms. Messrs. Hooper & Co., Covent Garden and Twickenham, were a good 2nd, with a tastefully arranged group; and Messrs. Fromow & Son, Sutton Court Nurseries, Chiswick, 3rd. The closely cropped and level sward upon which these groups were set down gave a charming finish to them. There was also a class for a group occupying a space of 60 feet, and here Mr. J. Hudson, the Gardens, Gunnersbury Park, was a good 1st; and Mr. A. Wright, gr. to E. H. Walls, Esq., Dumbert, Chiswick, 2nd.

Plants.—Mr. Bates, the Gardens, Poulet Lodge, Twickenham, had the best six stove and greenhouse plants; Mr. E. Chadwick, gr. to E. M. Nelson, Esq., J.P., Hanger Hill House, Ealing, being 2nd. The best three plants in flower were shown by Mr. F. J. Hill, gr. to H. Little, Esq., Twickenham, who had *Cypripedium barbatum* superbum, *C. Dominianum*, and *Dendrobium thysiflorum*.

Fine-leafed plants were shown in sixes, Mr. Chadwick being a good 1st; and Mr. A. Wright had six good exotic Ferns, Mr. Chadwick taking the 2nd prize. A very good half-dozen *Caladiums* came from Mr. Harding, gr. to W. E. Tautz, Esq., Chiswick. *Coleus* were fairly good, the best plants deficient in colour, and the best-coloured plants wanting in growth. Mr. A. Wright had the best *Fuchsias*; Mr. Milson, gr. to W. Lindell, Esq., Drayton Manor, Ealing, being 2nd.

Zonal Pelargoniums and also Ivy-leaved varieties were shown in good character by Mr. Little and others. Tuberous-rooted *Begonias* were a good feature, and made some of the best exhibition plants of the day. There was a special class for nine plants, Mr. H. Little staging a very good lot indeed; Mr. A. Wright being 2nd. In the class for three plants, Mr. H. Little was again 1st.

The handsome special prizes offered by F. G. Tautz, Esq., for three Orchids brought three collections. Mr. H. Little being 1st with *Cattleya Sanderiana*, *C. intricata*, *Dendrobium densiflorum*, *Aerides Lobbii*, *A. odoratum purpurascens*, *Cypripedium Veitchii*, and another; Mr. Cowley, gr. to F. G. Tautz, Esq., Shenard's Bush, was a good 2nd, his leading plants being *Cattleya gigas*, *Miltonia vexillaria*, *Dendrobium superbiens*, and *Cypripedium*. Some very fine *Lycopods* were shown by Mr. A. Wright.

Cut Flowers made a good feature. Mr. W. Rumsey, Waltham Cross, had the best twenty-four Roses, showing some very nice fresh blooms of Annie Wood, Richard Laxton, Grace Darling, General Jacquemont, Marie Baumann, Duchesse de Morny, Victor Verrier, Star of Waltham, Senateur Vaisse, &c. 2nd, Mr. C. Turner, Royal Nursery, Slough, Mr. Chadwick had the best blooms, Mr. W. Langdon, of Ealing, being 2nd. Roses were also shown in sixes. Mr. Cowley had the best twelve bunches of cut flowers, staging a very fine lot, consisting largely of showy Orchids.

Some prizes offered by the Marquis of Bate for the best boxes of York and Lancaster Roses, brought a good competition.

Table Decorations were, as usual, a prime feature. Special prizes were offered by the Duke of Devon-

shire for three stands or vases, Mr. J. Hudson, The Gardens, Gunnersbury House, being 1st, with very tasteful arrangements.

W. E. Tautz, Esq.'s, special prizes for a stand or vase of flowers brought but one competitor in Miss S. A. Fromow, of Turnham Green; and the same lady was placed 1st, with a charmingly arranged basket of Roses. Mr. Prewett, Hammersmith, showed good bouquets, being 1st.

**Fruit.**—The special prizes offered by Mr. Leopold de Rothschild for six dishes of fruit brought a brisk competition. Mr. W. Bates being 1st, with good Foster's Seedling and Alicante Grapes, Queen Pine, Stirling Castle Peaches, Lord Napier, Nectarines, and President Strawberries. 2nd, Mr. T. Donan, gr. to L. J. Parker, Esq., Ottershaw Park, Chertsey, Mr. Donan had the best two bunches of Black Hamburgh Grapes, Mr. Milson being 2nd. Mr. Donan was also 1st with two bunches of white, having good Buckland Sweetwater; Mr. Bates being 2nd with Foster's Seedling. Strawberries were very good. Cherries, Raspberries, Currants, and Melons were fairly well represented.

**Vegetables** were, as might be expected, a leading feature. The special prizes offered by Messrs. Sutton & Sons, seed merchants, Reading, for their Reading Perfection Tomato brought some very fine fruit. Special prizes were also offered by Messrs. James Carter & Co., High Holborn, and Messrs. W. Fromow & Sons, for collections of six varieties of vegetables, which brought in each case brisk competition. One novel class was for a collection of garden produce, to consist of twelve plants, twelve bunches of flowers, six kinds of fruit, and six of vegetables, the prizes offered by Lady George Hamilton; but it was a disappointing one, nevertheless. A class for nine dishes of vegetables brought a very keen competition, and good Potatoes, Peas, and Tomatoes were shown in these several classes. There were also a number of vegetable classes for cottagers, and prizes were offered for school children for bouquets of flowers, and arrangements of flowers on a plate, for which there were numerous entries.

The show was greatly helped by contributions not for competition. Among these was a fine group of show and fancy Pelargoniums from Mr. Charles Turner, Royal Nursery, Slough; plants from Messrs. Hooper & Co., very finely arranged; groups from Mr. J. Roberts, The Gardens, Gunnersbury Park, Ealing, and Mr. May, The Gardens, Chiswick House; a fine group of variegated and ornamental hardy shrubs and trees, sent by Messrs. C. Lee & Son, Isleworth; and cut Roses from their Ealing nurseries; a choice collection of plants from Mr. B. S. Williams, Victoria Nurseries, Holloway; and cut Roses from Mr. C. Turner. All these were highly commended.

## WINCHESTER HORTICULTURAL.

July 12.—The annual summer show of this Society was held in the Guildhall, the arrangements being as usual very satisfactorily carried out by the committee and the Secretary, Mr. C. Sherton.

**Roses.**—These formed the principal feature of the show, and were of fair quality this trying season. The entries amounted to 2800 blooms, but many failed to put in an appearance owing to injury from the rain at the last moment.

Seventy-two blooms, distinct. 1st, Mr. Frank Cant, Colchester, with a finished even lot of blooms Dr. Andry, Pride of Waltham, Thomas Mills, La France, A. K. Williams, Triomphe de Rennes, Marie Van Houtte, and Marechal Niel, being only a few of the best; 2nd, Mr. B. R. Cant, with smaller blooms lacking a trifle in freshness.

Thirty-six blooms, distinct, in triplets.—Here Mr. B. R. Cant was 1st, with a fine stand of blooms; 2nd, Messrs. Keynes, Williams & Co., Salisbury, with blooms certainly fresh, but a trifle uneven in size.

Twenty-four distinct single trusses.—1st, Messrs. Keynes, Williams, & Co.; 2nd, Mr. G. Prince, Oxford.

Twelve distinct triplets of Teas or Noisettes.—1st, Mr. G. Prince, with an even stand, the best blooms being Madame Watteville, C. Mermet, Alba rosea; 2nd, Mr. F. Cant, whose blooms were smaller.

Twelve blooms of any one variety, dark.—Mr. F. Cant was 1st with Ulrich Brunner; 2nd, Mr. B. R. Cant, with the same variety, running very closely.

Twelve blooms of any light coloured variety.—Mr. G. Prince was 1st with Merveille de Lyon, fine in size, but slightly wanting in freshness; Mr. B. R. Cant was 2nd, with same variety.

Twelve blooms of any one variety.—Mr. Frank

Cant was 1st, with Madame Watteville, very fine; Mr. G. Prince 2nd, with Souvenir d'un Ami.

The following classes were not open to nurserymen, and produced a good competition:—

Thirty-six distinct blooms.—Captain Ramsay, Ivory House, Fareham, Hants, was 1st, with a good stand, showing large and fresh flowers of Captain Christy, Marie Verdier, Pride of Waltham, and Duke of Wellington; Mr. W. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was a close 2nd. The National Society's Silver Medal was awarded to Merveille de Lyon, in this stand, as the best hybrid perpetual in the amateurs' division.

Twelve distinct, Teas or Noisettes from the Rev. F. R. Burnside Campden, Gloucester, were 1st, the National Society's Silver Medal for the best Tea or Noisette being awarded to Catherine Mermet in this stand.

Mr. Neville took 1st honours for six Teas or Noisettes and six H. P.'s, in threes, and for six Teas or Noisettes in threes.

**Fruit** was of moderate quality and sparingly shown.

**Vegetables**, on the whole, were good in quality and fairly plentiful. For nine sorts (two Potatoes allowed), Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, was 1st of four exhibitors, Magnum Bonum Cauliflowers, Veitch's Scarlet Model Carrots, White Elephant Onion and Ringleader Potato were his leading dishes; 2nd, Mr. Inglesfield, gr. to Sir J. W. Kelk, Bart., Tedworth, Marlborough. Messrs. Sutton & Sons, Reading, offered prizes for six distinct varieties. Seven competed, Mr. Lye, gr. to W. H. Kingsmill, Esq., Nydmonton Court, Newbury, leading with each of the samples.

For the best dressed stand of flowers Miss A. Flight led out of five, with an elegant arrangement; Miss B. Flight 2nd, also a capital stand.

Mr. E. Hillier, nurseryman, Winchester, staged the best bouquet; Miss Flight, 2nd.

## ROYAL SOCIETY OF CANADA.

At a recent meeting the following papers were read:—

**On the Nymphaeaceae.** By George Lawson, Ph.D., LL.D.—An account was given of the general conformation, and of the arrangement of tissue systems, in the organs of these plants, and of special features in their organisation and minute anatomy. The South American Water Lily, Victoria regia, had been many years ago fully described and illustrated, as regards its general botanical characters and history, successively by Dr. Lindley, Sir William Hooker, and Mr. Thomas Moore, and by the author of the present paper; as regards its minute structure and development it was more carefully studied by Planchon, whose researches were published in the *Flore des Serres*, vol. vi., p. 249, &c.; and Trécul, who illustrated the more important facts of its structure and the development of organs in the *Annales des Sciences Naturelles Botanique*, 4 ser., i., pp. 145-172. Some facts well known a quarter of a century ago seem to be forgotten now. Lately De Bary, in the *Comparative Anatomy of Phanerogams and Ferns*, and J. H. Blake, of Cambridge, in Balfour's *Annals of Botany*, August, 1887, question the explanations given of the structure of the prickles of the Victoria, and especially the character of the ostiole or depression at its apex. The author of the present paper had shown, as long ago as 1855, the true character of these prickles, and that the ostiole had no special function as had been argued (and inferentially was not pathological as now suggested by Blake), but "a simple depression in the apex of the prickle of no physiological importance." (*Proceedings Bot. Soc. Edin.*, November, 1855.) In the same paper it was shown that the stomatodes or perforations of the leaf, were not mere holes caused by insects, as argued by Trécul, and now accepted on his statement by Blake, but special structures of uniform size formed by surrounding modified cells, and comparable with the more complete reductions of parenchymatous tissue seen in submerged plants and in *Ouvirandra fenestralis*; moreover their special function in Victoria was indicated.

A series of large coloured drawings, illustrating the microscopical structure of the Victoria regia, was shown. These drawings were made by Dr. Lawson, partly from observations on the Victoria which flowered in Knight & Perry's nursery, King's Road, Chelsea, in the autumn of 1851, and partly from a plant which flowered in the Botanic Garden of Glasgow in 1855. They show the epidermis and stomata, with their chlorophyll granules, of the upper surface of the leaf; the surface cells, hairs, and hair-bases of the lower surface; the prickles in several aspects and

sections, showing their structure, the ostiole, &c.; the air spaces of the leaves and the large stellate processes projecting into them, whose surface has a bead-like sculpture reminding one of the much more minute markings on diatoms; colouring matter of the lower surface leaf-cells; the so-called "stomatodes" or perforations of the leaf, margined by more or less oblong, flat-sided cells, filled exclusively with red colouring matter; the upper surface petal cells, with thick translucent, slightly plicate or crimped cell walls, and filled with colouring matter of a rose colour of diverse depths of shade in different parts of the petal.

A statement is given of the historical facts connected with the nomenclature of Nymphaeaceae, with regard to the proposal recently made to give up the generic name *Nymphaea* to the yellow-flowered group so long known as Nuphar, and to reinstate *Salisbury's* name *Castalia* for the true white, red, and blue, Water Lilies. Acting on Professor Greene's suggestion, Mr. Britten had given very full details in the *Journal of Botany*, and these might be quite satisfactory to botanists in London or Paris, or wherever a large University library enabled the student to refer to original sources. Unfortunately, the great majority of Canadian students had no such facilities, and the additional information is given to meet their cases.

To Professor Greene is entirely due the credit of calling attention to *Castalia* at an opportune time when priority reigns paramount, and threatens indeed to exclude every other consideration. If, on occasion, an honourable member in a public assembly calls attention to the want of a quorum, or to the presence of strangers in the gallery, it is not usual to assume that his fellows were up to that moment ignorant of the fact.

The two volumes of König and Sims' *Annals of Botany* form a publication so full of important memoirs by European, British, and American botanists, written at a time of unusual activity in changes of classification and nomenclature that for the last eighty years it has been a constant reference-book for working botanists. A synopsis of the species of Nymphaeaceae was appended to the paper.

**Observations on Early-ripening Cereals**, by William Saunders.—Giving details of the work done in connection with the experimental farms in obtaining from other northern countries early ripening cereals, results are given of the testing of these in the north-west provinces of Canada including reports of earliness, productiveness and variations in quality of the same grain grown in different localities as shown by chemical analyses.

**Contributions to the Bryology of the Dominion of Canada**, by N. Conrad Kindberg, Ph.C., K.N.L., Professor in the University of Linköping, Sweden, and Professor John Macoun, M.A., F.L.S.—This paper contained descriptions of a large number of new species.

## GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

This Society held its summer flower show in the grounds of the International and Industrial Exhibition, Kelvin Grove Park, Glasgow, on the 11th and 12th inst., £500 being offered in prizes. The main feature of the show was to have been the Rose, but the weather has been adverse to the production of good Roses or anything else, yet there was, all things considered, a fine display.

Ireland carried off the chief honours. In the class of sixty blooms, distinct varieties, Mr. Hugh Dickson, Belmont, Belfast, was an easy winner, with the following as prominent blooms in his stand.—Marie Baume, La France, Lady Sheffield, Merveille de Lyon, Duke of Edinburgh, Paul Jamain, Alfred K. Williams, and Senateur Vaisse; Messrs. Harkness & Sons, Bedale, Yorks, were a good 2nd; and Messrs. A. Dickson & Sons, Newtonards, a close 3rd in this class.

In the class of forty-eight bloom positions were reversed with the same competitors.

In the class of twenty-four blooms Mr. David Robertson, Mossend Nursery, Helensburgh, took the 1st position with an excellent collection in which the Teas were fine; and Mr. W. Montgomery, Cardross and Messrs. T. Smith & Son, Stranraer, respectively took 2nd and 3rd prizes. This class was open to Scotch growers only, and forms the most important exhibit of Scotch-grown Roses in the show.

The class, twenty-four Teas or Noisette Roses, at least twelve distinct varieties, formed a wonderfully good feature. 1st, Mr. David Robertson, who had conspicuous blooms of Madame de Watteville,

Madame Willermoz, Perle des Jardins, Marie Van Houtte, Antoine Mermet, Reine Marie Pia, and Perle de Lyon. In this class Messrs. Harkness & Sons were 2nd.

In the class, twelve blooms *Maréchal Niel*, the best came from Mr. Tinsley, Lennoxton, whose flowers were superb, and yet said to have been cut from the open air, which in such a season as we are passing through is something to congratulate Mr. Tinsley upon, for the like could hardly be found elsewhere in Scotland.

The *Gloire de Dijon* class was largely represented, the best coming from Gordon, Drymen; and the 2nd best from Hugh Dickson. Space will not admit of particularising the competition in the smaller classes, which, however, were well represented the competition in some cases being very close.

In the competition for the best basket of Roses, Messrs. Perkins & Sons, Coventry, stood a conspicuous good 1st; Mr. Alexander Raeside, Yorkhill, Glasgow, being a fair 2nd.

*Gardeners' and Amateurs' Class.*—Thirty-six blooms, to which was attached the Memorial Medal and £5, presented by the Veitch Memorial Trustees, Mr. William Parlone, Rosevale Row, was the champion. The best Hybrid Perpetual Rose in the exhibition was shown by Mr. Hugh Dickson, and the best Tea by J. Tinsley.

*Pansies* were an important feature of the show. The 1st prize of twenty-four blooms went to Mr. Sutherland, Lenzie; Mr. W. Storrie, Gargabarg, Lenzie; and Messrs. William Paul & Co., Banghill Nursery, Bridge of Weir, Lenzie, being 2nd and 3rd respectively. Mr. Campbell, Blantyre, was an easy 1st, with a fine stand of twenty-four blooms of fancy Pansies; and Mr. Sutherland and Mr. Russell, Cawdor, Bishoprigg, closely divided the 2nd and 3rd honours respectively.

*Violas* or bedding Pansies, in bunches, were represented in tolerable numbers and good quality. The best in the open class of twenty-four was put up by Mr. J. Baxter, gr. to Colonel McCall, Baldoon, Broomhouse; Messrs. Dickson & Co., Edinburgh, also Messrs. R. B. Laird, being 2nd and 3rd in order.

The class of eighteen bunches hardy herbaceous flowers brought out one of the finest features of the show. The 1st prize went to Mr. Tinsley, Mr. John Meiklan, Alpine Cottage, Bridge of Weir, and Mr. Charles Irvine, Jedburgh, being 2nd and 3rd in order. Had the latter set up in a better style he would have been in a better position, as he certainly had points in his favour, particularly as regards variety and rarity of species and varieties.

Twelve trusses of stove and greenhouse plants (Orchids excluded) were a good show, 1st, Messrs. Laird & Sons; Mr. Sutherland and Mr. Lyon, Greenhall, Blantyre, being 2nd and 3rd respectively.

Six trusses of Orchid blooms, distinct:—1st, Mr. Grossart, Oswald House, Edinburgh; 2nd, Mr. Kidd, gr. to J. B. White, Esq., Ardarrach—a close 2nd.

Pot plants were not remarkable for numbers, although in some cases the quality was good. This was more noticeable in table plants than in any other class, which were indeed very superior, and the competition keen. In the class of twelve table plants, Messrs. R. B. Laird were 1st, closely followed by Mr. Grossart.

Three Orchids in flower placed Mr. Wilson, gr. to H. Steven, Esq., Westmount, 1st, with *Odontoglossum crispum*, *Miltonia Rozlii*, and *Epidendrum vitellinum majus*; Mr. Kidd, Ardarrach, was 2nd with *Cattleya Dowieana*, C. Gaskelliana, and *Odontoglossum Pescatorei*.

*Fruit*.—Though not a large feature this was an excellent one. The prize for a collection of six dishes went to Mr. McIndoe, Hutton Hall, Guisborough, there being no other competitor. The prize for four bunches of Grapes in two varieties was easily taken by Mr. McHattie, with very superior Black Hamburgs and Muscat of Alexandria, the latter being in finish more like autumn than summer fruits. Mr. McConnachie, Cameron House, Alexandria, was 2nd, with excellent fruit; and Mr. Barrie, gr., Woodstone Row, was a very good 3rd.

In two bunches of Black Grapes Mr. McHattie was again 1st, with fine samples of Black Hamburg; Mr. Murray, Parkhall, Polmont, and Mr. Montgomery, Broomhill, Partick, 2nd and 3rd respectively. With two bunches of white Grapes Mr. McHattie was again 1st, with fine bunches of Muscat of Alexandria; while Mr. Wilson, gr. to A. L. Cochrane, Esq., was a good 2nd, with grand samples of Dr. Hogg; and Mr. Montgomery took the 3rd prize.

Peaches were remarkably fine, Mr. McHattie, Mr. Gallacher, and Mr. Wilson taking honours in the order named.

Nectarines were also exceedingly good. Mr. McIndoe taking 1st, with Stanwick Elruge; and Mr. McHattie pushing him close with Elruge.

*Vegetables* were poorly represented, the schedule providing little encouragement for this class of garden products. An excellent collection of eight distinct sorts was, however, tabled by Mr. McIndoe, who took 1st prize, and was closely pressed by Mr. Hogg, Aikenhead. The latter took 1st prize for an excellent collection of salad stuff.

*Miscellaneous Exhibits* were numerous, and in some instances very meritorious. Pyrethrums, fancy Pansies, cut flowers of tuberous Begonias, and Carnations, the latter especially good, were put up by Mr. Campbell, Blantyre. Mr. Alex. Lister, Rothsay, tabled a numerous set of fancy Pansies, which were besieged by the admirers of Pansies in this district, who are very numerous, and their comments were laudatory. The lot were remarkably good, and some individual flowers were new in character, and possessed every good feature of the class. Messrs. R. B. Laird & Sons, West Coates, Edinburgh, had a very superior lot of Pyrethrums beautifully set up in their own foliage in triangular sprays, in which the leading varieties were well represented. Mr. John Wilson, gr. to Jas. Clelland Burnes, Esq., Glenties, Hamilton, exhibited a fine specimen of *Stanhopea tigrina* with sixteen blooms in a small basket. From the Botanic Gardens, Glasgow, came a fine collection of official and medicinal plants and tropical fruits, a hundred in all. Messrs. J. & R. Thyne had a fine table of varied foliage and flowering plants, and Mr. Jas. Boyson, nurseryman, Helensburgh, a fine lot of pot and cut Roses.

The Scottish Mushroom Company exhibited fine samples of their productions from the Scotland Street Tunnel, Edinburgh. Mushrooms were shown in every stage of growth in a capacious Wardian case, and appeared to attract much attention from the general public. Mr. McIndoe, Hutton Hall, Guisborough, exhibited samples of two fine Melons, his own raising, one named *Scarlet Premier*, a medium-sized oval fruit fine netted; and another, named *McIndoe's Best of All*, an oblate fruit, the colour of which was not described. Mr. Hugh Hanan, Bank Street, Edinburgh, exhibited samples of a very superior early Cauliflower, named *Hanan's Extra Early Dwarf*, from a cottage garden at Dalkeith, the owner of which had begun to cut crop on June 26. The judges commended the variety on account of its earliness and very superior quality.

## EDINBURGH BOTANICAL.

JULY 12.—The last summer meeting for the season was held in the Royal Botanic Garden, Mr. Lindsay and afterwards Dr. Craig, in the chair.

It was resolved, on the motion of Mr. Taylor to empower the Council to petition against the new Universities (Scotland) Bill, now before the House of Commons, in so far as it enacted the transference of the Royal Botanic Gardens from the Treasury to the Edinburgh University.

A paper, by Dr. David Christison was read, summarising the results of ten years' observations by the late Sir Robert Christison, and his son, the author, "On the Annual Increase in Girth of Trees in the Royal Botanic Gardens, and at Craigiehall, near Edinburgh, from 1878 to 1887."

In two specimens of *Betula alba*, with a girth when first measured of 55.40 and 56.20—the girths in 1887 were respectively 56.05 and 59.85. The total of ten annual increments of *Fagus sylvatica* were 6.30, 7.50, 6.05, 7.20, 5.90, 6.05, and 4.90. These figures, given in inches and tenths, mark the effect of cold seasons during the decennial period. Five British Oaks, *Quercus rubra*, had girths at commencement of measurement of 65.40, 69.45, 120.35, 112.90, and 94.50, which had increased in October, 1887, to 67.30, 73.20, 127.25, 115.10, 96.15. In three specimens of *Quercus conferta* there was a total increase in ten years of 16.55, 13.60, and 12.60. Two of *Q. cerris* showed growth equal to 5.70 and 7.33, whilst one specimen of *Q. rubra* showed an increase of 4.50 inches. Limes showed a smaller increase; thus, of three specimens of *Tilia europæa*, the figures of growth in ten years were, 3.05, 3.50, and 1.75. Two Planes show a nearly approximate increase. The girth of *Castanea vespa* was found to have increased in the ten years, 9.45; *Liriodendron tulipifera*, 6.00; *Crataegus oxyacantha*, 5.50; *Ornus europæa*, 4.15; *Carpinus betulus*, 4.10; *Fraxinus*, 3.75.

Amongst the evergreen trees, four specimens of *Sequoia gigantea* showed a total increase of 8.10,

14.13, 13.70, 12.80, respectively; and the same number of *Cedrus Deodara* gave a decennial increase of 8.50, 6.00, 5.10, and 5.30; whilst three of *Araucaria imbricata* gave 4.15, 7.00, [and] 6.30; two specimens of *Abies Douglasii* gave 3.90 and 4.80; whilst the record of the Scots Fir (*Pinus sylvestris*) is a miserable one, being for three specimens, 0.75, 0.65, 0.60; two *Pinus excelsa* gave 2.40 and 4.80; a *Pinus Laricio* gave 4.10, and a *Pinus austriaca* gave 14.40; while *Abies Lowiana* gave 11.10, and *Cupressus Lawsoniana*, 7.70. The average annual increase in girth of the Yew, *Taxus baccata*, was 34 tenths of an inch. Of some noted Yews, Dr. Christison gives the following details:—

Taxus.	Height June 25, 1879.	Average Increase.			
		Jan., 1885.	61 Years, 1815-78.	8 Years, 1879-87.	
No.	Feet. Inches.	Feet. In.	In.	In.	
41.	27 9	27 11.5	.....	.....	0.3
42.	29 7	30 2.5	.....	.....	0.64
43.	22 5	23 3	4.14	.....	0.94
49.	19 7	21 9.5	3.61	.....	3.06
50.	24 1	27 0	4.41	.....	4.10

The increment of two specimens of *Quercus Ilex* showed an annual increase of .25 of an inch.

Mr. John Wilson, B.Sc., read a paper on "The Leaf Glands of *Plumbaginea*." Axillary glands, corresponding to those which secrete copious mucilage in *Statice* *Holfordi* and like forms, were found to exist in all the *Statice* studied, in many *Artemisia* and *Plumbago*, in *Limnolobos*, *Acantholimon*, *Zygialitis* and *Vogelia*. In all the species examined minute oval glands, composed of a few regularly disposed cells, were also found, in most on both sides of the leaf, on the bracts, and even on the calyx. The glands which secrete lime (which in many species forms conspicuous incrustation) were also considered. Mr. Wilson has undertaken the study of the distribution, relationship, and development of the different glandular structures in the order.

Mr. Robert Turnbull made a communication on the "Distribution and Structure of Water Stomata in *Cotyledons*," which was highly commended by Professor Balfour.

Mr. Richardson exhibited and presented beautiful micro-photographs of root of *Vanda suavis*, stems of *Clematis montana*, &c.

Mr. Lindsay gave in his monthly report on "Progress of Vegetation at the Royal Botanic Garden for June."

"The month of June was unusually cold and disagreeable, in marked contrast to that of last year. Easterly winds were almost of daily occurrence. No frost was registered during the month at the garden, but in various districts of Scotland several degrees occurred, and much damage has been done thereby. The lowest night temperature recorded at the Garden was 35°, which took place on the 1st of the month; other low readings were registered—on the 3rd, 37°; 4th, 37°; 11th, 38°; 14th, 36°. The lowest day temperature was 42°, on the 2nd; and the highest, 72° on the 17th. Notwithstanding the cold backward kind of weather experienced, trees and shrubs generally have seldom been seen in finer condition; both foliage and flower have been decidedly above the average. Variegated forms of *Taxus*, *Biota*, *Retinospora*, and other Conifers have developed unusually bright and finely coloured foliage, affording a pleasant contrast to the dark green leaves produced by the typical species. This is not the least remarkable feature of this abnormally cold summer, seeing that variegated plants, as a rule, require abundance of heat and sunshine to enable them to colour well. The fine warm summer and autumn of last year has doubtless had much to do with their present satisfactory condition.

Annuals and other plants which depend entirely on the present season's growth for their well-being, are very far behind, and unless a change of weather come soon, will be a total failure.

Alpine and herbaceous plants, though somewhat late, are flowering freely, and owing to their not having suffered from drought this season, their period of flowering has been prolonged. On the rock-garden 430 species and varieties came into flower during June, making a total of 1052 since January 1, as against 1048 for the same period last year. Amongst the most conspicuous were—*Achillea*, *Cuscuta*, *Aciphylla squarrosa*, *Allium McLeani*, *Anemone palmata*, *Aster diplostaphyoides*, *Aquilegia*

glandulosa, Aubrietia Leichtlini, Campanula abietina, C. Allioni, Chamaebatia foliolosa, Clintonia Andrewsiana, Cornelia iberica, Cyrtopodium spectabile, Delphinium nudicaule, D. casimirianum X cardinale, Dianthus alpinus, D. gelidus, D. superbus, Dryas Drummondii, Eranthis pumila, E. serpyllifolia, Epilobium latifolium, Gentiana pyrenaica, G. Weschniakowi, Heuchera sanguinea, Ianthé bugulifolia, Linaria organifolia, Leontopodium alpinum, Lychnis viscaria splendens fl.-pl., Loniceria pyrenaica, Myosotis alpestris, Nardostachys Jatamansi, Onosma taurica, Orchis maculata superba, Oxytropis uralensis, Patrinia nudicaulis, Pentstemon Lewisii, Polygonum spherochastum, Ranunculus parnassifolius, Saponaria cespitosa, Saxifraga pyramidalis, Scilla peruviana, Vaccinium Mortiniana, Vancouveria hexandra, Veronica amplexicaulis, V. anomala, V. Colensoi, V. Hulkeana, V. vernicosa.

Mr. Bullen communicated extracts from the record of temperature, vegetation, &c., in the Botanic Garden, Glasgow, for June, 1888:—

"The lowest night temperature recorded during the month was 33° during the night of the 4th, the highest 49°, and that only on three nights. The mean day temperature in the shade has been correspondingly low, the highest reading was 73° but once only. The readings mostly varied from 69° to 65° since the dry weather set in on the 13th. Since then the day readings in the sun have been high, almost equalling those of June last year for intensity. During the latter half of the month 90° to 120° has been frequently registered; but the effect of the sun's heat has been greatly modified by the continuous cold east and north-east winds. Owing to the dry weather, and cold winds, particularly at nights both hardy and half-hardy plants are very backward of bloom, and the growth poor on all except the hardiest forms of vegetable life; even the foliage of our common deciduous trees is small as compared with last year, but fruit is abundant."

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending July 16, is furnished from the Meteorological Office:—

"The weather has again been dull, gloomy, and rainy over nearly the whole kingdom. Slight snow fell in different parts of the country during the early morning of the 11th, and was even observed as far south as the Isle of Wight. Towards the end of the period thunder and lightning were experienced at some of our southern stations.

"The temperature has continued below the mean in all districts, the deficit being as much as 6° to 8° over the greater part of England, and 4° to 5° over Ireland and Scotland. Soon after the commencement of the week it became abnormally low for the time of year, the maximum reading in London on the 11th and 12th not exceeding 54°, as the week advanced, however, the thermometer rose, and maxima between 71° and 74° were prevalent over south-western, southern, and central England. The absolute minima, which were recorded on rather irregular dates, were also very low, ranging from 35° in 'England, S.W.', and 36° in 'Ireland, S.', to 40° in 'Scotland, E.', and 'Ireland, N.', and 47° in the 'Channel Islands.' At Cullompton the thermometer on the grass fell to 31° during the night of the 12th–13th, and at Strathfield Turgiss to 32°.

"The rainfall has been less than the mean in Ireland and the extreme north of Scotland, but more in all other districts, especially over the eastern and central parts of Great Britain.

"Bright sunshine has again been very deficient generally. In 'England, N.E.', the percentage of the possible amount of duration was only 8, and in most other districts it varied between 12 and 23. In 'England, S.W.', however, 32 per cent was recorded, and in the 'Channel Islands' 52 per cent."

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JULY 23. (AVERAGE OF FORTY-FOUR YEARS.)

July 22 ... ..	63°·4	July 26 ... ..	63°·4

## Obituary.

THE death of Mr. CHARLES PITMAN some fortnight or so ago, removes from the ranks of the horticultural profession a man who in his day filled a unique position. He was for over fifty years the ground or outside foreman to Messrs. Osborn & Son, The Nurseries, Fulham. He was considered in the nursery-trade to be one of the very best men in that capacity, a remarkably good knifeman, and a first-class grower of fruit and ornamental trees and shrubs, and a clever propagator of hardy stock generally. His knowledge of stocks for fruit trees, and their suitability for particular varieties of fruits, was something remarkable. He possessed a great knowledge of the names of rare trees and shrubs, and was held up as a most reliable authority upon such matters. He was also greatly respected by all in the nursery trade. Under his management the Fulham nursery was noted

for the fine collection of fruit and ornamental trees grown there, and it was regarded as a good school for youngsters, and many an outdoor foreman has reason to be grateful for the tuition gained under Charles Pitman. He was pensioned off previous to the breaking up of the firm, and ended his days in quiet at the ripe age of over eighty years. R.D.

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPLES: A.H. We cannot name the fruits, send again when in good condition.

ARTIFICIAL MANURES: G.S.X. Artificial Manures: How to Make, Buy, Value, and Use. By Alfred Hibson, F.C.S., W.W. Ridgway, 169, Piccadilly, London, W. Price 1s., or less.

BOUGAINVILLEA: W.L. Yes, in the absence of any rule to the contrary. If the plant was grown and flowered in a greenhouse, it is a greenhouse plant.

CARBOLIC ACID FOR WEEDS ON WALKS: C.S. One ounce to one gallon of water. Apply with a rose watering can. The box or other live edging must be protected. The sea water you purposed using to kill weeds is of no use.

CORRECTION.—In article on "White Pinks," last week, p. 46, col. c, five lines from bottom, read "fat" for "pink" flowers.

DEADLY NIGHTSHADE: W. Bennett. This is Atropa belladonna. Solanum dulcamara—often, but erroneously, so called—is much less poisonous.

FLOWER HOLDERS: Rosa. Messrs. G. Smith & Co., Commercial Road, Pimlico, S.W., are the makers.

INSECTS: D.C. A microscopic examination of the Melon stems and leaves has failed in showing any trace of insects. The numerous small patches of white mould all over the leaves seem to be embedded in the substance of the plant. W.—W.E. The leaf of Odontoglossum crispum sent exhibits a large number of small dark coloured oval pustules, each covered with a thin transparent film like the cover of some small scale insects, but with a high power we could not discover any trace of insects. W. [Look for a further answer next week.] F.W.Z. Your Oncidium leaves show a number of small elongated brown patches, but no trace of insects of any kind. W.

MELONS: G.P. The roots are affected with the root-rot. Possibly the Torenias are so also, but we cannot find them.

MUSHROOM: H. Peckham. A very fine one, measuring 12 inches in the largest diameter across the flat top.

NAMES OF PLANTS: A.B. 1. Heuchera Richardsonii; 2. Tussilago fragrans; 3. Heracleum giganteum. —J.K. Populus monilifera: a form of P. canadensis.—G.H. Cytisus capitatus.—A.O.W. 1. Eucalyptus coriacea, easily recognised by the nerves of the leathery leaf, being nearly longitudinal—one of the hardiest species; 3, and 4, E. viminalis, known by the opposite leaves (when young), and by the three-flowered umbels; 5, E. coccifera; 6, probably E. globulus. CH. Nán.—Mrs. H. T. Goat's-beard (Tragopogon pratensis).—Pontypool. Ranunculus aquatilis.—A.H. The Bee Orchis, Ophrys apifera.—Not rare in chalk districts, but it is rare to see it in flower so late in the year.—H. & Co. Glycerium saccharoides.—G.W.S. Asteriscus maritimus.—C.A.L. 5. Veronica tucurum; 6. Scutellaria violacea.—J.S.W. 1. Veronica officinalis; 2. Heracleum sphondylium; 3. Peucedanum sativum; 4. Scutellaria altissima.—Constant Reader. 2. Saxifraga arizonae var. recta; 3. S. Hostii; 4. S. arizonae.—Bulbous. Leyton. Cyrtanthus obliquus, Ait. J.G.—P. Stanhopea insignis—ordinary form.—Hortus. Nigella damascena.

—*J. B. Oncidium Batemannianum*.—*G. W. R.* A good bright Cattleya Gaskelliana.—*Twenty Years' Subscriber*. *Dendrobium moschatum*.—*G. W. C.* The bush is *Prumnopitys elegans*, *Oncidium hastatum*, and *Lycaste cruenta*; the spotting is accidental.—*J. W. S. & Co.* 1, *Eria bicolor*; 2, *Miltonia Russelliana*.

ORNAMENTAL FOLIAGED TREES AND BUSHES FOR AUTUMN PLANTING: *Midland*. Deciduous "picture plants" are now so many that we must refer you to some good trade list for their names. We can merely mention a few of the more indispensable ones, viz., *Prunus Pissardi*; Japanese Maples in great variety—nice neat-habited plants, with foliage of much beauty and diversity; Privets of various variegated forms; variegated Elders, white, creamy-white, and yellow; *Acer pseudo-Platanus* Nizelli, purple, green, yellow leaf; *Acer argutum*, and *A. macrocarpum*; *Ptelea trifoliata aurea*; variegated pyramidal Oaks; Purple Beech in many forms; purple-leaved Hazel; Golden Catalpa; variegated Poplars; *Berberis vulgaris purpurea*; *Halimodendron argenteum*, silvery foliage; *Cornus mas variegata*; and *C. sanguinea*, the latter with bright crimson young shoots.

PEA, EXONIAN: *R. V. & Son*. An excellent, new variety of marrow Pea—early, prolific, podding almost down to the ground, the pods short but well filled. It was past its best; having been in perfection three weeks ago.

PHYTOLKERA: 40. Certainly not; a bad case of mildew.

POPLAR: *Campee*. The tree has been wounded, perhaps by some boy tugging at the shoots. Fungus spores enter the wound, germinate therein, prevent the proper healing of the bark, and increase and multiply; hence the canker, which is of very common occurrence in this tree. The fungus is probably *Nectria ditissima*. *H. M. W.*

SMALL ORCHARD, CORDONS, &c.: *Mulberry*. In your district, bushes and half-standards will be best for the inside parts of the quarters, and espalier and cordons at the sides near the walks. With regard to Cherries (especially Morellos), and such Plums as Greengage, Orleans, and Mirabelle, these are, perhaps, best grown as half-standards. Apples and Pears should be obtained on dwarfing stocks, so as to secure early returns. Cordons are easily managed, and can be made to produce fine fruits by thinning the young fruits and surface feeding. If your orchard is open to those points from which the heaviest gales come, it would be advisable to use generally the espalier form of training for most of the Apples and Pears, running the espaliers across the quarters at from 20 to 30 yards from line to line. These stiff walls of foliage break the force of the wind greatly, and save their own crop and that of the bushes growing between the lines.

TOMATO AND CUCUMBER GROWERS: *J. B. Manchester*. There are so many engaged in the business now, we cannot inform you who is the greatest. Some of the salesmen in Covent Garden Market could give you the information if applied to.

VINE LEAVES: *G. T. Coates*. The leaves have been scalded by sun-heat—perhaps during a sudden burst of sunshine following cloudy days. The ventilation of modern-built houses, roofed with large panes of glass, requires watchful care to avoid such accidents.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

## MARKETS.

### COVENT GARDEN, July 19.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

The wet weather is considerably affecting supplies of soft fruit, Cherries especially reaching us in very bad condition, and Currants colouring slowly. Hothouse goods in full supply; prices lower. *James Webber, Wholesale Apple Market.*

\*s. Orchid bloom in great variety, but the demand not very good.

## SEEDS.

LONDON: July 18.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report a very poor attendance on the market to-day. A speculative inquiry has sprung up for Trefoil at hardening rates. For Trifolium also higher prices are asked. The prospects of both these articles are badly spoken of, owing to the continued unfavourable weather. Mustard and Rape seed are but little inquired for. Bird seeds move off slowly on former terms. Blue Peas continue exceedingly cheap.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended July 14.—Wheat, 31s. 6d.; Barley, 28s.; Oats, 16s. 6d. For the corresponding week in 1887:—Wheat, 34s.; Barley, 20s. 6d.; Oats, 16s. 9d.

## FRUIT AND VEGETABLES.

SPIRITALLIES: July 18.—Very large supplies of all kinds of fresh vegetables, fruit, &c. Demand brisk, at undermentioned prices:—Fruit: Raspberries, 4d. to 6d. per punnet; red Currants 4s. 6d. to 5s. per half sieve; black Currants, 3s. 9d. to 4s. do.; Strawberries, 2s. 6d. to 3s. 6d. per peck; Cherries, 3s. 6d. to 4s. 6d. per half sieve; Gooseberries, 2s. 3d. to 2s. 9d. do.; English Tomatoes, 6s. to 6s. per peck of 12 lb. Vegetables: Cabbages, 1s. to 2s. 6d. per tally; Peas, 2s. 6d. to 3s. 6d. per bushel; do. 4s. to 5s. per sack; new Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; spring Onions, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. to 1s. 6d. do.; Rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; foreign Onions, 7s. 6d. to 8s. per box of about 112 lb.; frame Cucumbers, 2s. to 3s. 6d. per dozen; Endive, 1s. to 1s. 6d. do.; Cos Lettuces, 2d. to 4d. per score; Beetroot, 6d. to 8d. per dozen.

STRAITFORD: July 17.—Both trade and supply have been good during the last week. Quotations:—Cabbages, 2s. to 3s. per tally; Turnips, 3s. to 4s. per dozen bunches; Mangels, 16s. to 21s. per ton; Watercress, 6d. to 8d. per dozen; Gooseberries, ripe, 3s. per half sieve; do. green, 2s. 3d. to 2s. 6d. do.; black Currants, English, 4s. do.; Cherries, do. 4s. do.; Apples, 7s. to 8s. per box; Strawberries, 3s. per peck; Raspberries, 4s. per dozen punnets; Tomatoes, 9d. to 1s. per box; Cucumbers, 1s. 2d. to 2s. per dozen; Peas, 5s. to 7s. per bag.

## POTATOS.

BOROUGH AND SPIRITALLIES: July 17.—Large supplies, dull sale. Quotations:—Jersey kidneys, 5s. to 6s.; do. rounds, 4s. 6d. to 5s. 6d.; Cherborg, 4s. to 4s. 6s. per cwt.

SPIRITALLIES: July 18.—Quotations:—Jersey kidneys, 3s. 6d. to 4s.; do. flukes, 4s. to 5s.; St. Malo rounds, 3s. to 3s. 6d.; Lisbon do., 4s. to 4s. 6d.; Cherborg, 3s. to 3s. 6d.; do. flukes, 4s. to 4s. 6d. per cwt.

STRAITFORD: July 17.—Jersey kidneys, 80s. to 90s.; St. Malo rounds, 40s. to 50s. per ton; Dutch, 1s. 6d. per bushel; Cherborg kidneys, 80s. to 90s.; do. rounds, 70s. to 80s. per ton.

Imports.—The imports into London last week consisted of 1055 boxes from Barleir, 2638 packages from Jersey, 1492 packages from St. Malo, 941 boxes from Cherborg, 2526 cases from Rouen.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 94s. to 118s.; inferior, 76s. to 86s.; hay, prime, 90s. to 114s.; inferior, 75s. to 84s.; and straw, 26s. to 46s. per load.

BOXWOOD IN TREBIZOND.—It is interesting to know, from an official source, that there is a good prospect of the supplies of Boxwood from Trebizond increasing. It is stated that the contests between the authorities and the rural classes as to the ownership of Box trees was brought, in December last, to a termination satisfactory to the villagers, consequent on the action of the British Consulate in behalf of an English firm whose interests were thereby involved. If prices improve, therefore, Boxwood will once more become an important export to Europe, freed as it has now been, from the vexatious interference of local officials.

# THE SPHINCTER GRIP ARMoured HOSE COMPANY, Limited, 63, FORE STREET, LONDON, E.C. GARDEN HOSE. GARDEN HOSE. GARDEN HOSE.

Unequalled for Durability, Flexibility, and Lightness. Practically Indestructible. Will wear out ten ordinary Hoses, and withstand unlimited pressure.  
*IT CANNOT KINK OR COLLAPSE. IN UNIVERSAL DEMAND. RAPIDLY REPLACING ALL OTHER HOSES.*  
A Company, as above, having been formed to work the SPHINCTER GRIP ARMoured HOSE PATENTS, this Hose is now offered to the public at the undermentioned unprecedentedly low prices.

## PRICE LIST.

### BEST QUALITY RED OR BLACK RUBBER.

Place

Copies of each Journal are filed at the

above Offices for the use of Advertisers.

**WANTED**, by a Provincial Journal, a smart

all-round Gardener, to Manage its Horticultural

Columns, and assist generally.—Full details to address,

BOX 5355, Self-Advertising Office, London, E.C.

**WANTED**, for a Nursery near London, an

energetic painstaking man, to act as FOREMAN,

SALESMAN, &c. Must be acquainted with general

trade of the trade, and well up in Propagating and Growing

Stove and Greenhouse Plants, and other Miscellaneous Plants,

Trees, Shrubs, &c. Good salary will be given to a first-class

man. C. B. Gardener's Chronicle Office, 41, Wellington

Street, Strand, W.C.

**WANTED**, a MAN and WIFE, Man as

General Working Foreman in a Small Nursery. Wife to

Manage a large branch Shop for Sale of Fruit, Bouquets, &c.

Must both be well up in their business. Unfurnished rooms

provided. The highest references. This would prove a

very comfortable place to suitable persons.—Apply, stating

terms, which must be moderate, to PROPRIETOR, 3, Trinity

Road, Jersey. Note.—A knowledge of French desirable.

**TRAVELLER.**—A Nurseryman having a

large stock of select Hardy Shrubs, Fruit Trees, &c., &c.

(in the finest possible condition), is open to negotiate with

a good TRAVELLER (on Commission only). He

will be allowed to Sell Cheaply.—Terms with proofs of ability

and trustworthiness, to C. N. B. Gardener's Chronicle Office,

41, Wellington Street, Strand, W.C. No objection to his en-

gaging in other business not horticultural.

**WANTED IMMEDIATELY**, a FLORIST.

Must be competent to make up Wreaths, Bouquets, &c.—

KEATLAND MOLE, Florist, Bold Street, Liverpool.

Seed Trade, Ireland.

**WANTED**, as FIRST COUNTER HAND,

a Scotchman, who thoroughly understands his busi-

ness, and has had some Irish experience in the General Trade.

Address with copies of testimonials, and stating age, salary

expected, &c., to ZED, Gardener's Chronicle Office, 41, Wellin-

gton Street, Strand, W.C.

OCIATION, Union Court, E.C. (Est. 1871.) Name paper.

### GARDENING APPOINTMENTS.

**MR. JAMES ANDERSON**, late Foreman at The Hoo Gardens, Kimpton, Welwyn, has been appointed Head Gardener to G. B. C. YARBOROUGH, Esq., Camps Mount, Doncaster.

**MR. F. BEEVERS**, late Foreman at Campsall Hall Gardens, Doncaster, has been appointed Head Gardener to L. D. HALL, Esq., Farnham Chase, Slough.

### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Resendments and Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**RICHARD SMITH AND CO.**

beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**HOLLOWAY'S PILLS.—**Hale Constitutions. —When the human frame has become debilitated from the effects of exposure, excesses or neglect, these Pills will repair the mischief, if they be taken according to the lucid directions wrapped round each box. Holloway's Pills are the most exemplary tonic qualities, in all cases of nervous depression, whereby the vital powers are weakened and the circulation is rendered languid and untidy. They improve the appetite, strengthen the digestion, regulate the liver and act as gentle aperients. These Pills are suited to all ages and all habits, and their inventor's fame has resounded through all the quarters of the globe; where, wherever sickness exists this medicine has made its way to be everywhere largely approved and justly appreciated.

Fig. B.

## EXTRACTS FROM TESTIMONIALS.

### VILLAGE WATER SUPPLY.

*From Mr. THOMAS VARLEY,*

Agent to the Trustees of the late William Roundell, Esq., Gledstone Estate, West Marton, Sipton, August 11, 1887.

"DEAR SIR,—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of 2 miles from, and at an elevation of 280 feet above the ram. The water is then gravitated through several pipes and branches, having a total length of about 4 miles, for the supply of the mansion, gardens, stables, estate workshop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilise the water for other farms. I have much pleasure in being able to report as above."

*From J. B. McCALLUM, Esq., C.E.,*

Borough and Water Engineer, Blackburn, November 1, 1886. Guide (Borough of Blackburn) Water Supply.

"DEAR SIR,—Following is the short report I promised to send as to the work performed by the Hydraulic Rams—supplied by you to the Blackburn Corporation—after they had been in operation sufficient time to take proper observations.

"The district of Guide—population about 500—in the Borough of Blackburn, is situated above the highest reservoir of the Blackburn Waterworks, and had no regular water supply until last July, when the Water Committee caused two of your Patent Hydraulic Rams to be put down and worked by water from a reservoir having a varying but maximum head of 34 feet 3 inches on the Rams—the waste (clean) water gravitating to a lower adjacent reservoir.

"You contracted to supply rams which would force 8000 gallons per day each through 1265 yards of delivery pipe to a service tank 170 feet above the rams, and I am bound to state that the result has considerably exceeded my expectations, as the rams are capable of pumping, and have pumped, much more water than you promised. The percentage of efficiency exceeds all I expected, and is, in my opinion, much more than is usually obtained from hydraulic rams.

"From a test I made on September 28, I found that two rams with 4-inch and 4-inch strokes respectively, supplied with 194,730 gallons per day, together pumped 26,090 gallons per day to a height of 170 feet, giving 71.45 per cent. of efficiency, and one ram working at 4-inch stroke, and with only 16—18 feet of working fall, supplied with 154,587 gallons per day, pumped 10,587 gallons per day to the same height, showing 72.75 per cent. of efficiency.

"At a subsequent test on October 11, one ram at 4-inch stroke, and having 31 feet 9 inches of working fall supplied with 121,083 gallons per day, pumped 17,853 gallons per day to an elevation of 171 1/2 feet, the efficiency in this case being 78.57 per cent.

"In arriving at these results the greatest care was taken to positively measure the water, besides having a meter check on feed and delivery pipes.

"The work carried out by you at Blackburn is substantial and satisfactory in every way, and if any engineer wishes to make his own observations he is at liberty to come here and do so."

*From Mr. HENRY ROBINSON,*

Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

*From Mr. J. A. RUTHERFORD,*

Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middlesbrough, September 26, 1883.

"DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate, for Mr. C. F. H. Bolckow, are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11 1/2 gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since."

The Delivery Pipe, in the above case, is 9000 feet in length.

*From THOMAS ROBERTS, Esq.,*

Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trencham Hall, Staffordshire, April 13, 1886.

"DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Titenor (the residence of the Marquess of Stafford, M.P.) does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 3000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.—I am yours faithfully, "THOMAS ROBERTS."

*From HENRY MORTON, Esq.,*

Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 13, 1886.

"DEAR SIR,—The Patent Ram, with 1 1/2 mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Copt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 121 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 800 yards long, with a fall of 70 feet to the service-cocks and fire-plugs at Copt Hewick Hall, where in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

"I consider your method of carrying out the work is everything that could be desired, and, whilst the waste-power water from the Ram is less than you specified, the quantity elevated is just what you guaranteed.—I am, dear sir, yours very truly,

*From WILLIAM DICKINSON, Esq.,*

Agent to the Most Honourable the Marquess of Abergavenny, K.G., Eridge Estate Office, Hargate Lodge, Tunbridge Wells, July 3, 1885.

"SIR,—I am instructed by the Marquess of Abergavenny to say that the Patent Hydraulic Ram, with over two miles of pipe, forcing water to a height of 230 feet, which you erected at Eridge Castle about nine months ago, has given his lordship entire satisfaction, and he has every confidence in its continuing to do so.—I am, sir, yours faithfully,

"WILLIAM DICKINSON."

*From Captain TOWNSHEND,*

Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

**JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE, ENGLAND.**

### DONATIONS AND SUBSCRIPTIONS

WILL BE THANKFULLY RECEIVED BY

A. F. BARRON, Hon. Sec.,

Royal Horticultural Society's Gardens,  
Chiswick, London, W.

**PLANTING.—TENDERS REQUIRED** for  
Planting about 80 acres, chiefly with AUSTRIACA,  
IGNIS and PINASTER. For particulars and conditions,  
Apply, W. SMITH, Solicitor, Dartmouth.

**To Landscape Gardeners and Contractors.**  
**THE RAMSEY TOWN COMMISSIONERS**  
invite TENDERS for carrying out the work in connection  
with the MOORAGH PARK and LAKE. The work comprises  
the Construction of Lake, the Forming of Roads and Walks,  
Laying-out and Planting of Park, and the Erection of Shelters,  
Keeper's Lodge, &c., in accordance with Plan and Specification,  
which may be seen at their office. Specification may be had on  
application to the undersigned after July 5. Sealed Tenders,  
endorsed "Tender for Mooragh Park," to be sent in to the  
undersigned on or before the 15th day of August next.

The Commissioners do not bind themselves to accept the  
lowest or any Tender.—By order, JAMES BELL,  
Clerk to the Ramsey Town Commissioners.

Town Commissioners' Office, Ramsey,

Isle of Man.—June 25, 1888.

## CLEARANCE SALE OF STRONG HEALTHY PALMS.

Latania borbonica, Scaevola elegans, Phoenix reclinata,  
&c., 20 to 24 inches high, 16s. per dozen. Same kinds,  
2 ft. 6 in. to 3 ft. high, 3s. to 5s. each. Handmade Palms  
for decoration, 5 ft. 6 in. to 6 ft. high, 70s. per pair. Small  
Palms, 10 to 12 in. high, 4s. per dozen.

Kentia, from 3s. to 21s. each.

Over 50,000 Palms to select from.  
B. OWEN, The Palm Gardens, Stamford Hill, N.

A Visit solicited.

## LARGE PLANTS TO BE SOLD.—

10 Orange Trees of sorts, 7 to 10 feet, well covered  
with ripe and small fruit; 6 Camellias, 6 to 8 feet; 6 Azalea  
indica, 4 to 6 feet; 2 Palms, Scaevola elegans, 9 feet each;  
1 Corypha australis, 5 feet. All the above plants are clean  
and in good condition. Can be seen at Bettisfield Park,  
the residence of the late Sir Edward Hammer, and for further  
particulars apply to

THOS. THOMPSON AND SON, Ellersmere, Shropshire.

**GARDENERS**, guaranteed perfectly free from  
bug or scale, good plants in 32s., 2s. per 100; large  
plants in 24s., 30s. per dozen, best Covent Garden variety. A  
rare chance for any one in want of a clean stock.

W. L. MILNE, Market Grower, Newhampton.

UNDER ROYAL PATRONAGE.

## BEGONIA EXHIBITION

The Grandest Floral Display  
in London.

Open to the Public every day (Sundays excepted) from  
June to September, 9 a.m. to 7 p.m. daily.

ADMISSION FREE.

## OUR EXHIBITIONS OF BEGONIAS

Have been celebrated for their varied beauty  
and extent for the past few years, but the  
**COLLECTION** now on view is superior to any  
of the kind ever yet seen, both in single and  
double varieties, the shades of colour being quite  
indescribable, and must be seen to be appreciated.

All lovers of flowers are cordially invited.

Nearest Railway Stations are Catford Bridge, Mid Kent  
Line (S.E.R.), from Charing Cross, Waterloo, Cannon Street,  
and London Bridge; and Forest Hill (L.B. & S.C.R.), from

**THOMAS METHVEN AND SONS**  
offer their choice strain of the above, in five varieties, viz., Scarlet, Purple, White, Crimson, and White Wall-leaved, at 1s., 2s. 6d., and 5s. each colour. Price to the Trade on application.

By Royal Warrant, Nurserymen and Seedsman to the Queen, Edinburgh.

**80,000 CLEMATIS**, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—**RICHARD SMITH AND CO.**, Nurserymen and Seed Merchants, Worcester.

# NOTICE

TO THE

## HORTICULTURAL TRADE.

HAVING for some years past, owing to the particular nature of my business as a Horticultural Agent, recognised to the fullest extent the absolute importance of securing speedy transit and quick delivery, in the case of all plants sent from the Continent to England and vice versa; and having myself suffered great inconvenience, annoyance, and loss from causes which could easily have been avoided, had the shippers entrusted with plants possessed any practical knowledge of their nature and requirements, I beg to inform you that, my business with the Continent having become so extensive, I am now obliged, in self defence, to take up the business of a

## SHIPPING AND FORWARDING AGENT.

I am so well aware of the serious consequences of a few hours frost in the case of plants left on the wharf for a night—as frequently happens—and which by a little care in warehousing can be easily avoided, to the great benefit of sender and buyer, that I have determined in future to give all such details my closest personal attention, and beg you to recognise the advantages which will thus be gained by your shipping all your consignments to this country through me.

I have secured admirable premises for this branch of my business at 12, Cooper's Row, Crutched Friars, London, E.C., and with the available accommodation at the various wharves for the proper and prompt warehousing of the most tender plants, am in a position to assure you that I possess every facility for conducting the business in a manner that I am sure will give satisfaction to those who may favour me with their patronage and support.

**WILLIAM DENMAN,**

**THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.**

AN old writer on the art of violin playing commences his treatise with the remark that all men may be divided into two classes—those who play the violin and those who do not. His mind was for the time concentrated on one subject. I have for some while past been thinking so much about the process of the formation of tubers and their management by cultivators, that for the time I have come almost to regarding men as divisible into two classes—Potato cultivators and Potato consumers. A cultivator may or may not be also a consumer, but he mainly cultivates for others. For myself, I come in the division "consumer."

COMPOSITION OF THE TUBERS;—STARCH, &c.

Potatoes are eaten and cultivated for table because they contain starch. Such, at least, is the accepted view of their value in a dietary. Most people know that tubers are said to "consist of" starch granules, and nearly every one is familiar with the pictures of granules from Potatoes, from Wheat, &c., magnified so many diameters. We know that Potato granules are shown as 0.185 mm. in diameter, Wheat 0.050 mm., Sago 0.070 mm., and so on. Also that they are very pretty objects for the polariscope—that at 160° C. starch is converted into dextrine—that the granules are insoluble in cold water, alcohol, and ether, but that when heated in water to between 70° and 72° C. they split and form a paste, from which, after boiling and the addition of alcohol, there is precipitated a white amorphous powder of soluble starch.

All this is very interesting information, but it does not much help to answer the question, How is a tuber formed?—still less the practical question, To what extent has the cultivator any control over the formation of tubers in relation to the amount of starch they contain? Even the statement that Potato tubers consist of starch granules,

is a rough one. Many old analyses indicate they do not. Trade catalogues, which give the percentage of starch in different varieties, show what a difference there is in the amount of starch present. (Whether these percentages are given on the authority of actual analyses, or have been obtained by some such apparatus as the amyloimeter,\* shown at South Kensington in 1876, or the feculometer, I have not been able to learn.) Of what is the remainder of a tuber composed? It is a question of interest to every consumer to know this, and whether the remainder is as digestible as starch. If all tubers consist entirely of starch granules, why should some behave so differently from others as they do, when boiled—some being "waxy," some "mealy as a ball of flour," and some "watery"?

When I told a Covent Garden dealer the kind of interest I take in Potato growth, he laughingly replied he thought I should find cultivators said like Topsy, "expect they grewed," and never bothered their heads about the chemistry of a tuber. I can hardly believe that this is so now, however true it may have been twenty years ago. If so, there is less attention paid to Potato culture than to cereals. But he is more likely to know than I, who can only guess how far cultivators study their crops.

Professor Phillips in his memoirs of William Smith has preserved an anecdote of an agricultural meeting at Longleat about the year 1800. Mr. Davis, steward to the Marquis of Bath, observed to a farmer that he had not seen him at the last meeting. "Why no, zur: I been thinking, zur, these agricultural meetings don't do much good." "I tell you what, my friend: they have done some good if they have set you thinking, for that is what you never did in your life before!" If I set some cultivators, who can work out the questions, thinking how a tuber is formed, though they may never have thought about the subject before, I shall accomplish just what I am aiming at.

We all know the old saying, that a fool can ask a question that it puzzles a wise man to answer. But questions have a use if they set anyone at work to answer them. Indeed, in every intentional experiment (as distinct from an accidental experience), we must first have the question quite clear which the experiment is designed to answer.

#### PROGRESSIVE ACCUMULATION OF THE STARCH.

About this time last year it occurred to me that an interesting preliminary step would be to examine Potatoes from the same plot of ground at different stages of their growth with regard to (1), The percentage of starch they contain, as ascertained by actual analysis; and (2), whether the starch was equally distributed through the tubers.

Messrs. Carter & Co., of Holborn, generously consented to send plants at successive periods of growth, and Mr. Robert N. Lennox, of the Royal Institution, kindly undertook the consecutive analyses in his own laboratory. The results will be more fully referred to presently, but I wish to mention here that they show these facts:—In the youngest specimens the percentage of ash was 10.8, and of starch, 16.4; and in the last sent the percentage of ash was .70, and of starch, 24.4. The increase of starch was steady all through the series, and the water steadily diminished from 80.5 per cent. in the earliest, to 70.6 in the latest specimens. Further than this, the starch was not equally distributed through the tubers, the outer portions containing much more than the inner. Photographs of thin sections treated with iodine show that the area of the greatest amount of starch has an "irregular boundary line, as may be seen from the woodcut (fig. 8). Although the woodcut hardly reproduces the delicate gradations shown in the photograph it perhaps suffices to illustrate the unequal distribution of the starch granules. Iodine forms with starch, a com-

pound, which has a characteristic blue colour. It is the lighter portion of each section that indicates the area of deepest blue—that is, the area of most starch. Direct chemical analyses (as will be seen from the tables below) on the outer and inner portions of tubers confirm the fact, that there is more starch in the former than the latter, though they, of course, cannot, as the photograph does, show the gradations of distribution.

It would be absurd to attempt to generalise from a series of analyses made on one variety only; but these results are suggestive. A large number of varieties growing in different soils, early and late varieties that are subject to different climatic conditions, would have to be examined and account taken of temperature, rainfall, and sunlight, before we could safely generalise on the rate of formation of starch granules. The more delicate work of starch formation in leaves, involving the use of appliances for microscopical photo-chemistry could perhaps be undertaken only by younger cultivators who have had a training in scientific manipulation. But there are many investigations I think cultivators might undertake with a little trouble combined with systematic method. With regard to published analyses, there is one point that has often struck me. The percentage of ash is almost always returned simply as "ash," without any statement as to its composition. Queries: Is it the same in all cases? Does it depend on the soil? or is the selective power of the plant sufficient to overcome differences of soil? Do the compounds which the process of analysis returns as "ash," pass in the growth of the tuber through chemical changes that may affect the rate of the formation of starch in the tuber? We may surmise on these points, but definite investigation is what is needed.

It must be borne in mind that the formation of starch in leaves, which has been studied by Mohl, Sachs, Pringsheim, Godlewski, Nägeli, Schimper, and others, is a different question from its formation in tubers. Leaves form starch from which gases constitute the air. In them the existence of starch molecules appears to be but a passing stage to the formation of other carbon compounds. Tubers form their starch from the carbon-compounds already in the plant. In them the starch (or most of it) assumes the form of granules, and here it remains more or less permanent till sprouting commences.

Now, although I have been told that to talk "chemistry" (as it is called) in asking questions will only frighten most cultivators, I do not see how to help it. It is frequently remarked by those who regard only the changing nomenclature and changing symbols used by chemists from time to time, that it is no use trying to "learn chemistry," as every few years it are "all altered;" and such facts are referred to as that "carbonic acid," and "sulphuric acid," and other familiar names, are not even to be found in the index of the latest works. With the cultivators, who, I am told, are frightened at chemical names, I fully sympathise. It is at first confusing to grasp the meaning of such a name as "Triethylphenylammonium hydroxide." Some people can gain knowledge more by sight than sound, while others depend chiefly on remembering sound. It is to my more easier to see the meaning of the formula,  $\text{NC}_6\text{H}_5(\text{C}_2\text{H}_5)_3$  or, better still, in a formula in "rings," as is now more commonly done.

#### ATOMS AND THEIR ARRANGEMENT.

It is, of course, one thing for a chemist to ascertain facts by experiments, and group his facts in accordance with a theory applicable to all chemical changes, and quite another thing to adapt some representation of them for other people's information, in words or by symbols. For myself I always found it easier to follow the descriptive or "glyptic" formulae, the different coloured balls of which represent atoms, and the little rods joining them represent the force, or forces, holding them together: the force we as yet know nothing about. Whether we use the term

"chemical affinity," "mutual attraction," "action at a distance," or any other term we like, we do not know what it really is we represent by our little connecting rods. We may soon perhaps be able to represent it in such terms as electricians use; but as we do not yet know what electricity is, we shall not even then have advanced much in explanation. Every one knows that, with a magnet under a sheet of paper, we can move a steel needle above it, and we say we move the needle because we move the source of magnetism. But when there comes the question, What is magnetism—what is this "action at a distance"? we have no answer. We know that with a magnet and an electric coil, battery, and wires we can send messages. We can practically use electricity, though we do not know what it is. So with chemical affinity. Our Arts depend on it, and we use it almost at will, though we do not know what it is. Our little rods to hold the balls together do very well to represent it—to help us in our ignorance to form a picture to our minds. We can manipulate the balls to represent such chemical changes as we think our experiments tell us.

Equally we know very little about the atoms the balls represent. For convenience they are made spherical (for class purposes about the size of billiard balls). But we do not know the shape of atoms or even whether they have any definite or constant shape at all. As regards their size—Sir William Thomson, from the result of many calculations in four different lines of research, has given, as a rough popular illustration of the average size—that if a ball of water, the size of an ordinary foot-ball, were magnified to the size of the earth, the average size of each component atom would then appear about that of a cricket ball—perhaps three or four times larger, perhaps as small as shot. We may for present practical purposes leave out of consideration the questions of the size and possible shape of atoms, and what the "chemical affinity" is that binds atoms together. It is worth noting that Dalton, in his early work (beginning about 1802), in studying atoms called them "particles," and did not adopt the word atom for some years. In print he made use of small circles with symbols to represent different "kinds of atoms," carbon, hydrogen, oxygen, &c. The plan that will here be followed is that of enclosing the first letter of the name given within a circle.

#### COMPOSITION OF STARCH.

Thus the composition of a molecule (the sense in which the word is used will be presently explained) of starch is expressed as containing:—

—that is, six atoms of carbon, ten of hydrogen, and five of oxygen,\* often expressed thus:— $\text{C}_6\text{H}_{10}\text{O}_5$ .

To represent a molecule of fruit-sugar an additional

would be needed. The grouping of the atoms in a molecule will have to be considered.

Though this method is hardly so striking as the balls and rods, yet it is found by many that it can be more readily understood than the formula  $\text{C}_6\text{H}_{10}\text{O}_5$  for starch, and  $\text{C}_6\text{H}_{12}\text{O}_6$  for fruit-sugar; while in the change from carbonic acid and water to starch, with oxygen set free, the change from starch to sugar, or sugar to starch, it helps the mind to picture the changes going on without troubling it with figures.

For illustrating what are the chemical changes in plant-growth where balls and rods cannot be used (as in manuscript or print) circles with connecting

\* Exhibition of Scientific Apparatus at South Kensington, Catalogue No. 2737. Demby's Amyloimeter. F. H. Böhler, Breslau. Said to have been quite new in 1875. Its merit is stated to be the simplicity and accuracy with which Potato starch can be tested.

\* That the numbers 6, 10 and 5 show the relative proportions of C, H and O seems firmly established by all experiments. Whether the numbers should be 12, 20 and 10, or some much higher multiple, is not so sure.

lines are perhaps the most convenient substitute, and since the question of the probable relative position of atoms in a molecule has been of late more studied many chemists have readopted the method.

Dalton's idea of different kinds of atoms, with different relative weights, and of an "attraction" of some kind that holds them together, but permits of their separating, combining, separating, and again reforming in other fixed relations, was delightfully pictured by Roscoe in his British Association address last year at Manchester. He likened the atoms held together by the unknown "chemical affinity" to people in a dance of many figures, where each individual for a while joins hands with others, separates, forms part of another group, and separates again to make up other groups.\*

To a cultivator, or to anyone else who has paid no attention to chemistry, a sight of Fremy's or Wurtz' *Encyclopædia*, Gmelin's *Handbuch*, or Watt's *Dictionary* with its supplements, is an appalling sight. But a cultivator does not need to know: it would not help him to know the technical processes of iron,

those of *Megaclinium falcatum*, 2½ cm. high, 4½ in circumference. There are two strong cuneate-lanceolate acute leaves, 5 cm. in length, 1 broad. The peduncle (3 cm.) is covered with imbricating sheaths. The rachis (3½ cm. to nearly 1) is light green, scarcely lobed. Bracts triangular deflexed. Flower of *Megaclinium falcatum*. Petals longer and more arcuate, side sepals also reflexed. Lip trilobed, wholly membranaceous, side lobes angulate, mid lobe oblong. Column with two sharp introrse teeth, one on each side of the fovea, hence quite distinct from that of *Megaclinium falcatum*.

I had this "curio" from Major Lendy, Sunbury House, Sunbury-on-Thames. It was purchased as coming from Madagascar. *H. G. Rehb. f.*

*DIPODIUM PALUDOSUM*, *Rehb. f.*; *GRAMMATOPHYLLUM PALUDOSUM*, *Griff.*; *WAILLESIA PALUDOSA*, *Rehb. f.*

This plant has distichous ligulate-acute membranaceous leaves. From the axil or axils of the lower leaves spring the long peduncles with a raceme

being blunt or bilobed. Both the sepals and the petals are usually dark blackish brown showing very little yellow. I have just now specimens at hand of a variety with a broader lip. The plant has been found quite isolated in one particular spot, where there are no other *Odontoglossa*. Mr. W. Kalbreyer has just brought over living plants. The bulbs are said to be much more like those of *Odontoglossum crispum* than those of *O. luteo-purpureum*. They produce inflorescences even when very young and small. These inflorescences are also often branched. The flowers have, according to Mr. W. Kalbreyer, a most powerful and agreeable smell. *H. G. Rehb. f.*

*LÆLIA EYERMANIANA*, *n. hybr. (nat.?)*

This lovely, perhaps unique, Mexican novelty, (fig. 12, p. 109), has lately appeared with Mr. F. Sander at St. Albans. The lucky possessor believes it to be a hybrid between *Lælia majalis* and *L. autumnalis*. It came amidst *L. majalis*, of which the bulb is just the same. *L. autumnalis* was seen in the same place. The leaves are ligulate acute, very strong, 6 inches long by nearly 2 inches in width. My Hartwegian specimen of *L. majalis* has a leaf of nearly the same length, although usually the leaves are smaller, but they are represented quite as large by Lindley and Bateman. Humboldt's typical specimen of *Bletia speciosa* (= *Lælia majalis*), has quite a large leaf. The peduncle is stated to bear four flowers. They are equal to an average flower of *L. Gouldiana*, hence smaller than those of *L. autumnalis*. The sepals and petals are of a lovely rose-purple, with a green knob outside at the acute apex of these sepals. The petals are cuneate-oblong, blunt (!). Lip three-lobed. Side lacinia oblong, shorter than the rounded, somewhat wavy mid-lacinia. Colour white, border rose. There are two keels with a third one in the middle from the base to the centre, whitish, washed with purple and with some purple spots; suddenly constricted into three approximate yellow keels on the disc. Column white with some purple spots at the base in front, and some transverse running yellow lines; the anther was too far advanced for good study. Mr. Sander informs me the smell is that of *Orchis coriophora*.

I have not the least doubt, the plant is an undescribed one. The bulb is most evidently that of *Lælia majalis*. There is, however, some difference in the blunt petals, as both *L. majalis* and *L. autumnalis* have them acute. The abrupt constriction of the keel resembles fully that *L. majalis*. We may get in future enlightened, provided the precious unique lives and develops itself. Mr. F. Sander has desired that it should be named in honour of Mr. J. Eyerma, of Easton, U.S.A., one of the most enthusiastic orchidists of our days. *H. G. Rehb. f.* [The plant has been shown twice lately at the Royal Horticultural Society when the leafy bracts shown in our figure, were much commented on. Ed.]

FIG. 8.—ILLUSTRATION SHOWING THE RELATIVE QUANTITY OF STARCH IN DIFFERENT PARTS OF THE POTATO TUBER.

zinc, tin, or alkali works, or of brewing or dyeing, nor all the history of what is called pure or philosophical or theoretic chemistry. *W. S. M.*

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### MEGACLINIUM OXYODON, *n. sp.†*

This is a small plant, very much like *Megaclinium melanorrhachis*. Its bulbs are spherico-tetragonous, placed at intervals on the creeping rhizome, dark green with black, much wrinkled, and with punctiform impressions, entirely different from

of eight to twelve flowers. Sepals and petals lanceolate-acute, cream-white, spotted with purple, nearly an inch in length. Lip with two teeth at the base, where it is rather thickened, cuneate-oblong acute, soft and velvety on the mid-line, white; side partitions of the anterior largest lacinia marked with some longitudinal purple lines. Column thickened and yellow at the top, the remaining part white.

It was originally discovered by our English hero, Dr. Griffith, in the swamps of Ayer-Punnus in Malacca, with two species of *Nepenthes*. Later it was discovered in Borneo (Pontianuk, imported by Messrs. Veitch), and now Mr. Regnier, of Fontenay-sous-Bois, sends fine fresh specimens, which came originally from Cambodia. *H. G. Rehb. f.*

*ODONTOGLOSSUM CUSPIDATUM* (*Rehb. f.*) *PLATYGLOSSUM*, *n. var.*

I described this curious plant as long ago as 1876 in Garcke, *Linnaea*, xlii., p. 26. It is also represented in my *Xenia Orchidacea*, ii., t. 18. It is allied to *Odontoglossum luteo-purpureum*, but the petals are very acuminate and not edged, and the narrow lip is terminated by an abrupt cuspidate apex in lieu of

### ÆRANTHUS OPHIOPECTRON, *n. sp.\**

This is stated to have the stem and leaves of *Æranthus Carnovianus*, the flower, however, is very distinct. The sepals are triangular acuminate, 1 inch long by one-sixth wide at the base. The petals are narrower, curved downwards behind the lateral spreading sepals. All these organs are yellowish-green. Lip triangular acuminate, white, with a long filiform obovate reddish spur, twisted near the base, exceeding the lip four times. It was kindly sent me by Messrs. H. Low & Co., having been introduced by them from Madagascar. *H. G. Rehb. f.*

### NOTES FROM OAKWOOD.

I SEND a few notes of observation lately made at my experimental garden at Oakwood, Wisley. The late weather, so objectionable to mortals, and so bad for the hay, has thoroughly suited some plants. We have never before had *Meconopsis Wallichii* nearly in such beauty as it is in this year, both the blue and purple varieties. Having learnt at New that

\* *Æranthus ophioplectron*, *n. sp.*—Caulis, foliis, inflorescentia *Æranthi Carnovianus*, *Rehb. f.* pedunculo (semper?) unifloro; bractea ovario multo breviori; sepalis tepalibus lanceolatis triangularibus; tepalis retrocurvis deflexis; lobello triangulo acuto, callo in calcaris ostio humili, angulo utrinque de columna basi in calcaris ostio descendente, calcaris filiformis, lobis semel torto. Ex *Madagascar* imp. ex: High Low & Co. Pro hortis *Angræcum ophioplectron*. *H. G. Rehb. f.*

\* To be a perfect illustration some people must be supposed to have more than two hands, and some only one.  
† *Megaclinium oxyodon*, *n. sp.*—Rhizomate repente; pseudobulbis distantibus sphaeroides-tetragonis diphyllis; foliis cuneato-ligulatis acutis valde coriaceis; pedunculo densissime imbricato vaginato; rachis foliacea ligulata apiculata margine vix lobulata; bracteis triangularibus deflexis; floribus *Megaclini falcatis*; tepalis longioribus magis arcuatis; lobello trilobato brevi, lobis lateralibus angulatis; columna lata juxta androcinium utriusque dentis magno introrso. Bulbophyllum *oxyodon*. *H. G. Rehb. f.*

this requires a damper situation than *M. nepalensis*, we gave it this in some instances, and the cloudy, damp weather seems to be just what it likes. The flowers of *Iris Kempteri* also last longer than they do in the sunny weather which usually prevails when they are out. I have always believed of this *Iris* that it was important that the seed should be sown as soon as ripe, that the roots should not be in the water, and that the clumps should not be disturbed. Unsuitable weather, my being busy, and other matters, prevented the seed, which ought to have been in the ground last autumn, being sown till this May; to my surprise it came up thickly in about a month. I should mention that the seed was kept in the pods, but many of them had opened. A few plants which I tried with the roots in the water look healthy, and are blooming well, and a visitor to our garden tells me that he has seen a sketch taken in Japan where the plants were quite in the water.

Some of my oldest clumps being rather bare in the middle, I broke a few up in May into six or seven pieces, and planted them quite near the undivided ones; the pieces are blooming the best. I think these unexpected results may be worth recording. *George F. Wilson.*

### SPATHOGLOTTIS AUREA.

DR. LINDLEY named this fine plant as early as 1850 in *Pastor's Flower Garden*, vol. i., p. 16, n. 32, stating that it was introduced by Messrs. Veitch & Son, having been discovered by T. Lobb, in Mount Ophir, in the same locality as *Nepenthes sanguinea*. I have no memorandum as to whether it flowered with Messrs. Veitch or not, but it would appear that it did. My late friend, Mr. John Gould Veitch, presented me with a wild specimen gathered by Mr. T. Lobb, and labelled Borneo. A nearly flowerless peduncle, with four or two (!) bracts may be from Malacca. For a quarter of a century, as far as I know, nothing fresh was known about the plant till it was quite lately re-introduced by Mr. F. Sander, having been collected by his traveller, Mr. Foerstermann, who hoped that it might be new. I could not see any distinguishing character in the dried specimens, but I hoped for some good overlooked mark of distinction in the fresh plants. Sir Trevor Lawrence, Bart., M.P., P.R.H.S., has been so kind as to send me a fine peduncle more than 3 feet in length, far better than Griffiths' specimen in Dr. Lindley's herbarium. The study of these materials brought one surprising fact to light, viz., that the mid-partition at the apex of the lip is subject to the greatest variation. It occurs quite narrow and acute, or broad, or very broad at the top, simply retuse, or acute, or three-toothed.

The leaves are plaited membranous ligulate-lanceolate acuminate, more than 3 feet in length by 1½ inch in breadth. The peduncle kindly sent me by Sir Trevor is purple, green at the top. There are twenty-one bracts, which are divaricate, ligulate concave, nearly spoon-shaped, which gives a very remarkable appearance. The flowers are a little larger than those of *Phaius cupreus* and *flavus*, excepting for the narrow lip. The sepals and petals are oblong obtuse, spreading, of the brightest yellow. The sepals have some brown longitudinal lines and some brown marks at the base. The side partitions of the lip linear are retuse, central partition with a triangular acute auricle at each side at the base, and a central part of distinct shape, to which allusion has been made above. There is a saddle-like two-shanked yellow callus at the base. The colour is yellow, with small purple-brown lines on the lips, excepting at the top of the mid-partition. Arched column yellow. There is no doubt the plant is a fine one, well worth cultivating. *H. G. Reck, f.*

[The plant was shown and certificated under the name of *S. Kimballiana* at the recent Temple show, where it formed one of the features in the remarkable group exhibited by Sir Trevor Lawrence. Our illustration (fig. 9) was taken from this plant by Mr.

W. G. Smith. We may add the following particulars of cultivation, &c. Ed.]—

The cultural treatment it requires is much the same as that afforded to the genus *Bletia*, the material used in potting being turfy yellow loam, peat, and sphagnum moss with a little silver sand added—the *Spathoglottis* being terrestrial plants.

*Spathoglottis aurea* was first sold at Stevens' Rooms by its importers, Messrs. F. Sander & Co., in September, 1886, with a glowing, but it must be owned, an accurate description. It forms an admirable companion to the beautiful *Spathoglottis angustorum* which is the same in general appearance, but white and rose, and the rather smaller bright rose *S. plicatum*, both of which were introduced by Linden of Brussels.

### NURSERY NOTES.

#### ORCHIDS AT MR. WILLIAM BULL'S.

WITH unabated splendour runs Mr. Bull's Orchid show, which has attracted so many distinguished visitors to his establishment in the King's Road, Chelsea. The arrangement of the long Orchid show-house, its stages edged with drooping *Panicum* and the setting of Maidenhair, and graceful Palms of the *Cocos Weddelliana* character, is the same as at the opening some months ago, but during the intervening time a continual and entire change has taken place in the occupants of the house, as one after the other the great and showy sections of Orchids come into bloom, the display from first to last being linked together by the successive flowering of fine forms of *Odontoglossum crispum*, for which the establishment is noted. A while ago the principal feature observed was the many large specimens of *Miltonia vexillaria*, its rosy flowers mingling with the snow-white flower-spies of *Odontoglossum crispum*, the numerous flowers of *Masdevallia Harryana*, in all tints from pale lilac to brilliant scarlet. At present the numerous varieties of *Cattleya Gaskelliana* and *C. Mendellii* are grandly flowered and tastefully arranged with *Odontoglossum crispum* and *O. Pescatorei* specimens form the striking feature of the display, and to the florist perhaps the most noteworthy; but the pleasures of the orchidist begin with the inspection of the rare and new species and varieties or those which, although not rare are not often observed in such fine specimens.

The *Cypripedium* in bloom just now of first importance—are *C. Lawrenceanum* coloratum, a rich crimson tinged flower; *C. Stomei* roseum, finely formed flowers, whose colour is suffused rose; *C. cananthum* superbum, *C. concolor* tonquinense, *C. bellatulum*, *C. b. roseum*, *C. Godefroya*, *C. Sanderianum*, *C. ciliolare*, *C. Dauthierii*, many varieties of *C. barbatum*, *C. caudatum*, and a fine six-flowered spike of *C. Parishii*, which has very peculiar leaf-bracts.

Besides varieties of *Cattleya labiata*, which make a fine show, are *C. velutina*, *C. superba*, many varieties of *C. gigas*, among which it is difficult to conceive a more richly coloured flower than *C. g. regalis*; *C. Lawrenceana*, *C. guttata* Leopoldi, *C. Eldorado*, and several varieties of *C. Harrisoniae*. The *Laelias* contribute to the show, *L. cinnabarina*, *L. crispata* superba, *L. xanthina*, and *L. elegans*.

Besides the great show of the large white *Odontoglossum*, which is a continuous feature, the other *Odontoglossum* in bloom in more or less quantity are *Cervantesii*, in great variety; *O. hastilabium*, *O. nebulosum*, *O. Schleiperianum*, *O. citrosomum*, *O. cristatum*, *O. cristatellum*, *O. cordatum* *Kienastianum*, many examples of *O. Harryanum*, *O. Andersonianum*, and many hybrids whose parentage it would be difficult to guess. Of *Miltonias*—a feature of the nursery—there were *vezzilium rubrum* and *M. v. Chelseiense*, with fine purple radiating lines in the centre. In *Oncidiums* may be mentioned some grand specimens of *O. macranthum*, and one with over fifty flowers; *O. hastatum* Ernestii, a charming thing; *O. cornigerum*, *O. Schlimgii*, *O. leucochilum*, *O. sarcodes*, *O. janieriense*, and many others.

*Masdevallas* are well represented, the perfection of brilliancy being found in *M. Harryana* Meteor, whose flowers are of a glowing scarlet, with a yellow eye; and of the most interest botanically are the curious beetle-like flowers, numerously produced, of species of the pigmy *M. triaristella*.

Many *Aërides*, *Saccolabiums*, *Vandas*, and *Dendrobiums* are in flower; the handsome *Epidendrum atropurpureum*, *E. nemorale*, *E. prismatocarpum*, *Brassia antherotes*, *Sobralia macrantha*, *Catasetum sanguineum*, *Zygopetalum Gautieri*, *Calanthe veratrifolia*, *C. Dominicana*, *C. vestita* gigantea, *Lycaste Skinneri*, *L. Deppiei*, *Miltouia Regnelli*, *Anguloa eburnea*, *A. Clowesii*, and *A. Ruckerii punctata*, *Angraecum falcatum*, *Disa grandiflora*, and some fine *Stanhopeas*.

At the further end of the house a pleasing feature in the arrangement is presented by *Oncidium Papilio* and *O. Kramerii*, whose numerous butterfly-like flowers mingle with those of *Phalaenopsis amabilis*, *P. Sanderiana*, and *P. speciosa*, and beneath which appear the scarlet blossoms of *Epidendrum vitellinum* majus, the white and orange *Dendrobium Jamesianum* and *D. formosum* giganteum, and the graceful *Dendrochilum filiforme*—*Asparagus plumosus* and *Maidenhair* forming the setting.

#### MESSRS. J. LAING & SONS.

Owing to the lateness of the season the outdoor Tuberosus *Begonias* at the Forest Hill Nurseries are rather backward just now, but there is full promise of a brilliant display of colour at a later date. In the houses, however, there is a fine lot of plants in flower. It is unnecessary to speak of the general points of the strain, which is well known. Of first merit are the strain called by the title "Royal;" the flowers are very large, flat, and of good substance. Princess Louise, a fine round flower, is one of the best whites; Princess Victoria, rosy-crimson; Duke of Edinburgh, deep red, and very rich; Duchess of Edinburgh, a rich golden-yellow, are some of the best singles in flower; and Duchess of Teck, a fine double, measuring 2 to 3 inches in diameter. Of other single varieties *pendula* deserves to be placed in the front rank as a basket plant. It is, as its name implies, of a pendulous habit, the rose flowers being freely produced, and attain about 6 inches in diameter. A. G. Soames is a fine deep crimson of the ordinary type, and Guardsman, a good scarlet; of the bicoloured sorts Charmer, white, with a rich crimson edge, still remains a good form. Golden Queen was the best yellow, being the colour of the Buttercup, and Torey Laing should be named as a strange coloured flower, it is a yellowish-red and very distinct. Snowball is a full pure double white and Lady J. Goldsmid, a delicate salmon-pink, also double, as is also Viscountess, white with rose-margin.

Of ornamental foliaged *Begonias*, B. Lubbersii, recently illustrated in these columns, is well grown; and we also saw plants of B. M. Hardy, deep claret, and B. also-violaceous, similar to M. Hardy with a metallic whitish tinge over it.

In the Orchid-house there were several small pieces of the graceful airy-looking *Dendrochilum filiforme* in flower, used as an edging to the stage, in which situation it looked extremely well. *Cattleya Gaskelliana* in several forms were in full flower, and there was a large stock of *Dendrobium Wardianum*, in excellent condition. The *Caladiums* were to be seen to advantage in several grand specimen plants of such varieties as *candidum*, *albo-luteum*, *amoenum*, pale rose, with dark ribs and a green edge; *La Perle* de Brézel, rosy-white, with dark green veins; Madame M. Scheffer, white, reddish-brown and green lines and a green border; L'Autonne, grey spots on white—a distinct variety; Le Titien, red and green, with red ribs—a very pretty and bright thing. *Triomphe de l'Exposition* is a deep red self, with deeper ribs. A remarkable greyish-red is seen in M. J. Picot, and in *Sanchonanthus* is a large leaf of crimson, with a bright green edge. *Hastatum* is not so vivid, being green

with a few large white spots—a very pleasing combination.

*Phyllanthus Chantrieri* should be in the possession of lovers of the strange, yet pretty and graceful; it bears branches in a tufted manner, coming from the stem in a gentle downward curve as in some Conifers. This plant is about 2 feet high, and is a slow grower, the leaves dark green, glossy, arranged in two rows along the branch, with the flowers laying on them.

Gloxinias were represented by a few good plants, but the majority had finished flowering. There is one of the finest whites we have seen, under

plants, a section of which Coombe Wood has many to show, and these mainly natives of Japan, China, and New Zealand, countries that have supplied Messrs. J. Veitch & Sons with many of their finest novelties in trees and shrubs.

The first visit is usually made to the greenhouses and propagating pits and houses, not so much for their contents, but from the circumstance that the outer walls are clothed in parts with plants not seen elsewhere, and of which the gardener knows but little. Of these plants we may name *Elaeagnus macrophylla*, a large-leaved species, with stout, large, entire leaves of grey-green—a fine thing

side. *Clematis coccinea*, with scarlet tubular flowers, and *C. crispa*, with blue ones, but not yet out, were planted against the opposite walls. *C. coccinea*, although of annual growth from the ground level, makes a considerable amount yearly, and would reach the top of a wall 8 feet high. *Tracheliospermum jasminoides* the perfection of an evergreen covering for a dwarf wall. It has neat small leaves, and clings without being nailed or otherwise fastened to it. It was coming into flower. *Lonicera japonica*, with flowers white and yellow, is excellent for a wall—it will flower up to November.

In the open parts of the nursery we found *Phyl-*

FIG. 9.—*SPATHOGLOTTIS AUREA* (KIMBALLIANA): TOP OF THE FLOWER-STALK, FLOWERS YELLOW. (SEE P. 92.)

the name of *Virginalis*. Mrs. Brockhaus is violet, with a spotted edge, fading towards the margin. There were other equally good forms, but it must suffice to mention *Unique*, white, densely spotted with faint lilac; and *Favourite*, similar, but with pale red spots, both very distinct.

Messrs. J. VEITCH & SONS, COOMBE WOOD.

The month of July is one of the best in which to inspect the contents of a tree nursery; for, though you may miss the tints of the early foliage of most species of tree and shrub, and which are seldom of long continuance, the more permanent form and colour of leaf and shoot are better observed. This is more particularly the case amongst evergreen

for a wall, but perhaps too tender to stand quite in the open away from the southern shores. Here it is hardy, and seldom gets disfigured in any way by frost. *E. pungens* has a green leaf edged with creamy-white—a perfectly hardy species, fine for a wall of moderate height; *Grevillea sulphurea* has been full of its quaint blooms, now just over; also a good subject for a low wall; this one, and *G. rosmarinifolia*, with pink and white flowers, were just gone out of bloom (July 17).

A good plant for a shady wall is *Ligustrum lucidum* tricolor. The young shoots are pink in colour, and the leaves yellow and green. There was a plant, *Lagerstemia indica* violacea, which had flowered last year under glass, but now standing out-

lyrea *Vilmorineana*, and the small *P. V. decora* were doing well. This is an excellent evergreen which everyone ought to get and which does well in smoky localities; *Ligustrum japonicum*, usually seen as a bush, is here grown as a standard, and specimens with neat heads covered with flowers were observed. *Berberis stenophylla* was likewise worked on high stems of *B. Darwini*; these and many other tall subjects form nice "starers" in level masses of other kinds of shrubs.

*Genista tinctoria*, a dwarf shrub, was finely in flower—capital for a small group or an edging to a bed of shrubs. *Hydrangea mandshurica* differs largely from the common *Hortensia*; it has a larger leaf, and the young growths are black-skinned, the

flowers pink; *Sambucus racemosus* runs into many various forms of leaf; *S. racemosus* var. *seratifolius* is one of the best of these. *Eucryphia pinnatifolia* has white flowers, which appear in September, is an evergreen of distinct appearance. *Philadelphus microphyllus* is a miniature Mock Orange, with shilling-large white flowers, smelling of Pine-apple. A very distinct-looking evergreen is seen in *Adenocarpus decorticans*; *Buddleia intermedia* has a long cluster of light purple flowers, not unlike those of common Sage at a short distance. Several fine species of Japan Oaks, of undoubted hardiness, have grown into good-sized bushes; they would grow equally well in the standard form. *Quercus cuspidata*, now in bloom, is one of the most distinct forms; it has entire leaves, 6–7 inches long and 2 inches wide, of a dark green colour, and leathery texture. Our *Q. Ilex* is a pigmy form beside this species.

(To be continued.)

## ORCHID NOTES AND GLEANINGS.

### CATTELEYA SCHRODERÆ ALBA.

Mr. Morse sends us a flower in which the parts of the flower are in decussate or crossed pairs instead of in threes, having two sepals and two petals without a lip. The column is normal.

### ZYGOPETALUM STAPELIOIDES, *Rehob. f.*

This pretty little plant is now flowering in the Kew collection, and though not a showy plant it is one well worthy of cultivation. The flowers bear a certain resemblance to those of certain *Stapelias*, especially in colour—a circumstance which suggested the specific name. The whole plant is but some 3–4 inches high, growing in a dense tuft, the lanceolate leaves being very pale green, and the flowers, which are borne singly on short peduncles from the base of the pseudo-bulbs, measure 1½–2 inches across, the colour being pale greenish with numerous transverse purple bars, except the lip, which is very dark blackish-purple, running off into spots on the margin. It is well figured at t. 3377 of the *Botanical Magazine*, under the name *Maxillaria stapelioides*, from a plant collected by Gardner, on the Organ Mountains, in Brazil, and which flowered in the Glasgow Botanic Garden, in 1830. It was originally figured and described by Link and Otto, as *Cymbidium stapelioides*, then transferred by Lindley to *Maxillaria*, in his *Genera and Species of Orchidaceous Plants*, afterwards made *Promenaea stapelioides* by the same author, and finally this genus has been merged in *Zygopetalum*, the name now standing as above.

### ZYGOPETALUM CITRINUM, *Nicholson.*

Closely allied to the preceding and very similar in habit is *Zygopetalum citrinum*, a really handsome little gem, also flowering at Kew. The flowers are a little more open, the segments more acute, the colour canary-yellow, the face of the column being striped with reddish-brown, and the side-lobes of the lip spotted with the same colour. It is also a native of Brazil, and is the *Promenaea citrina* of Don. *R. A. R.*

### ONCIDIUM SPLENDIDUM, &c.

This very beautiful Orchid is now flowering at the residence of G. C. Raphael, Esq., Castle Hill, Englefield Green. The plant in question is one of very recent importation, and has proved to be quite true to name. The writer had an opportunity of inspecting one of the very few plants of this species when it flowered at Manley Hall, Manchester, now some sixteen years ago, and has no hesitation in saying that the one at present in bloom is in every respect quite up to the original form. The imported plant was placed in a basket with a little peat, crocks, &c., and hung up in a house where *Dendrobiums* were.

Cœlogynes, *Miltonia vexillaria* are doing very satisfactorily here; two new growths of the latter species have pushed up which have made four pseudobulbs; the more forward one has made a

spike 3 feet long, with three laterals, producing altogether twenty-three flowers of fine size and substance; the second spike is only partially developed. In the same house is *Cœlogyne Massangeana*, with a spike of twenty-four flowers. *Oncidium Cressus* has two spikes; *O. Gardnerianum* is in good form; *Miltonia vexillaria* *Cobbianum*, almost pure white; *M. v. rubellum*, very dark in colour and nice in form; *Burlingtonia candida*, *Cattleya Mendellii gigas*, *C. Gaskelliana superba*, *Diss grandiflora*, *Odontoglossum*, &c., in other houses, are also bright and gay. *W. S.*

## THE ORCHARD HOUSE.

In a season such as the present one, the value of a heating apparatus in these houses is of great value to bring up the flavour in the fruit, and also to develop the wood in the first place, and assist in ripening it later on. Those who have not had great experience in growing orchard-house fruit (Peaches and Nectarines) do not sufficiently realise the importance of the special treatment the trees require in the various stages of the growth of the fruits. I have already detailed the management of the trees when in bloom, and after the blossoms were set, up to the stoning period. For about six weeks, when the stones are forming, the fruit apparently makes no progress, but this is only apparent, as growth is quite as active at that time as at any other; and when the stones are perfectly formed, the fruit rapidly swells and ripens, but in this stage a high temperature is necessary for the production of fruit of large size and good quality; and in cold, dull weather, such as we have had during the last six weeks, this has not been attainable without artificial heat. I noticed this year that in our earliest Peach-house, from which the fruit has just been gathered, the fruits at the warmest part of the house were much larger and of better quality than those close to the ventilators, where the constant circulation of air by day kept the atmosphere some degrees cooler than the part of the trees near the top of the rafters, where the air was at least 5° warmer by night as well as by day.

*Pot Trees* require a very great deal of attention both during the stoning period and at the time from the finishing of stoning until the fruit is nearly ripe. Neglect to supply the roots with water would be disastrous, and a high temperature can be kept up in warm weather by shutting up the house early, say 4 in the afternoon. The temperature might rise to 90°, and at the time of shutting up the trees ought to be well syringed with water that is nearly as warm as the temperature of the house. In dull cold weather artificial heat is of great service in improving the quality of the fruit. When the fruit is nearly ripe syringing should be discontinued, and more air admitted, and during this time artificial heat may be again very useful. It does not follow that the fruit will not ripen in an unheated house; but it is quite certain that it ripens much better, is of larger size, and superior in flavour with it. The young shoots may have been stopped up to the end of July, but it is better not to do so later. It is a great error to leave too much young wood on the trees—not a shoot should be left that is not necessary. This applies to Pears and Plums; they, of course, ripen much more freely in an unheated house; and some of them do well when placed out-of-doors. I have often urged the importance of repping any trees that require it soon after the fruit is gathered. The object is to get them well established before the leaf falls. They do not mind a considerable reduction of the roots, even to the extent of chopping off the matted mass of fibres round the ball, reducing it an inch or more all round, and repping them in the same sized pots.

Trees when planted out do not require a very rich soil, or gross, unfruitful growth will result; but when trees are in pots, and under the control of the cultivator, a much richer compost becomes necessary. I use good fibrous loam four parts, one

part decayed stable manure, and some crushed bones; and this material requires to be rammed into the pots quite firmly. I have reported them in sunny weather, and kept the shoots from flagging, and the leaves from dropping off by frequent syringings with tepid water. *J. Douglas.*

## THE FLOWER GARDEN.

MEMORANDA.—In regard to summer bedding plants the present is a good time for taking notes of defects and shortcomings, that they may be avoided in future, and especially in respect of novelties, the arrangement of plants, contemplated changes, and other matters. I would also advise the stay-at-home gardener to leave his retirement and make a point of seeing what his neighbours are doing if he would not lag behind in his profession. Tuberous-rooted Begonias are rapidly rising in favour as summer bedding plants, and in such wet weather as we have recently experienced, their superiority over Pelargoniums has been well proved, so that those who have not hitherto grown them in beds would do well to give them a trial next year. Some of the most attractive beds in the gardens here consist of these plants with a groundwork of *Alternanthera aurea*; the latter, however, is not so effective as *Mesembryanthemum cordifolium variegatum*, used on a previous occasion, and another year we must seek for an improvement in other directions; some of the *Sedums*, *Saxifragas*, or *Herniarias*, will probably answer the purpose. Other effective bedders are to be met with in the double-flowered Ivy-leaf Pelargonium *Jeanne Gillet*, of a rich magenta colour, the bed being edged with Golden Pyrethrum. Of the newer zonals I have not yet seen anything to surpass Henry Jacoby or Jenny Dods, rich crimson and pink respectively; whilst amongst scarlets John Gibbons will probably hold a foremost place for a considerable time to come. Coming to sub-tropical subjects, I find that *Cannabis gigantea*, interspersed with *Lilium auratum*, on a groundwork of *Mesembryanthemum*, and an edging of *Alternantheras* make effective beds; the same may be said of *Solanum laciniatum* with a groundwork of *Petunia* Countess of Ellesmere, and an edging of scarlet Tom Thumb Tropæolums. Again, *S. robustum*, Purple King Verbena, with a broad band of *Stachys lanata*, may be noted. The plan of forming carpet-beds in a series of terraces has exceeded our most sanguine expectations, and will certainly be adopted next year; we regard them as being infinitely more pleasing and effective than those that are planted on the old and monotonous "one level" system; of course they require a larger number of plants and more labour to keep them in good order, but this is more than amply compensated for by results. *Cyperus natalensis*, which we are employing for the first time as a "dot plant" on carpet-beds, is found to be a grand acquisition, and will be largely used for the same purpose in the future.

*Hardy Bulbs*.—Certain species of spring-flowering bulbs growing in mixed borders, and which have been undisturbed for two or three years, may now be lifted and replanted, the principal object being to give them a change of soil, without which bulbous like other plants will deteriorate in the course of time. Amongst others that will be benefited by this treatment we may name *Scilla sibirica*, *S. bifolia*, *Chionodoxa Luciliae*, Parrot Tulips, and Narcissus. Although many successful growers take up the bulbs—dry, store away and plant at a later period, the practice is not absolutely essential to secure success, and I myself prefer that the work of lifting, sorting, cleaning, and planting should proceed simultaneously. Of course there are cases where this line of practice must be deviated from at times, as in the case of *Ranunculus Asiaticus*, *Anemone coronaria* and their varieties, which may be lifted when ripened off, stored away in a cool place, and planted at a later period.

*Hedges*.—Where these have not been already trimmed and put in good order, that work ought not to be further delayed. Those of a deciduous character may be cut with a pair of shears, but with evergreens, such as Laurels, &c., it is best to use a knife or *secateur*. Those that were planted last autumn or spring may be left uncut. Hoe and clean the soil at the bottom as often as becomes necessary; and see that the young growth does not get choked with weeds. *J. Horsfield, Heytesbury.*

## REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1883.]

*The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.*

## FORESTRY.

**HEDGING.**—Privet, Box, and Laurustinus hedges may now receive their first trimming. Nothing excels the switch knife if kept well sharpened for this kind of work. Weed the ground along the line of the hedge, but defer digging the soil till a future time. Where hedges of Yew are being clipped or trimmed have a sharp outlook to see that the work-men burn up or dispose of in a safe way—safe from farm-stock—all prunings, for these, especially in a half dead state, are highly poisonous.

**Nursery Work.**—During dry weather keep the hoe at work; but there is little use in hoeing during wet weather, a better plan is hand-weeding and carrying all the weeds so collected to the dung-yard. The weeding of seed-beds can now be managed satisfactorily, and if such work be carefully done no evil results will follow from loosening the ground.

A few of the Elm seeds collected during the past fortnight should be sown during dry weather in beds 4 feet wide. Previous to sowing the seeds, it is well to ascertain whether they are fertile or not, a great number this season being destitute of an embryo. Thoroughly work the ground where the seed-beds are to be formed, and should it be found necessary, an addition of leaf-mould, peat, or good vegetable loam, will considerably enhance the strength and growth of the young plants. Do not sow the seeds too deeply; simply roll them over, and sift on from a fine-meshed riddle a half-inch of light sandy loam. Do not roll after covering the

seeds, this being a pernicious practice that cannot be too forcibly condemned. Look over young stock of all kinds, and with a sharp pruning-knife lop off all contending or rival leading shoots, as well as un- gainly side-branches. This work, performed while the young stock is in the nursery, is productive of lasting good, and should never be left until the plants are being sent out for final transplanting. Grafts may require attention in the way of removing too tight ligatures, replacing the clay or cement, and breaking off (not pruning) any shoots that may be pushing from the stock beneath the scion.

**Insect Pests.**—The depredations caused by the various insects have assumed alarming proportions this season, whole plantations of Oak being almost stripped of their verdure. On this estate the Oaks suffered; Elms and Limes have suffered greatly. The exudation of the various caterpillars was falling so thickly on the woodland paths, that many persons were puzzled to account for the constant rain-like, dripping noise, that during the dry and warm weather was carried on uninterruptedly.

Thunder-showers, however, did much good by washing the caterpillars from off the leaves, and so considerably checking their depredations. Miss Ormerod suggests painting a band of tar around the trees that are not affected, and so preventing the insects from ascending to the branches—good old advice, no doubt, for the owners of cockney places with half-a-dozen isolated trees on their lawn, but quite out of the question with the owners of woods and forests.

The Pine-beetles (*Hylurgus piniperda*) have also been at work of late amongst the Austrian and Corsican Pines, and by boring into the leading shoots have quite destroyed the symmetry of the trees, the leaders falling off during the first high wind after the attack. Burning up all brushwood in early spring is the best means of preventing the spread of the Pine-beetle.

Another insect pest that has done much damage in the Kentish woods of late is the goat-moth (*Cossus ligniperda*), the depredations of which have here been almost wholly confined to the Birch and Poplar—the former in particular. It bores into the stems of the trees, and in some instances the holes are so thickly set that one would almost imagine a gun loaded with swan shot had been fired against the trunk.

The best remedy we have found is to bore after the grub with a gimlet, and insert into the holes a mixture of paraffin and lime. This effectually gets rid of the pest, far better than the tar usually recommended, which, where the bark is injured, is highly injurious, and has been the cause of death in numerous instances. Usually the grub bores in from the base of the stem and works its way upwards, the tunnels formed having a most offensive smell, and from which the common name of the moth is derived. Trees on low-lying and damp ground are most liable to the attacks of the goat-moth, but here several Beeches and Poplars growing on high and dry land are likewise affected. *A. D. Webster, Holwood Park, Kent.*

FRIDAY, AUG. 3 { Imported and Established Orchids, at Frotheroe & Morris' Rooms.

The Fruit Crops.

THE reports, which we owe to the kindness of our correspondents, on the condition and prospects of the fruit crops throughout the country, will, we suspect, prove a puzzle to those who seek to ascertain the causes of success or failure. In the South, at any rate, the fine warm summer and autumn of last year "ripened the wood," and the spring gave, in consequence, promise of an abundant harvest. This profusion of flower was marked in the case of most flowering shrubs, which have this year bloomed with a freedom and beauty rarely equalled. But the numerous contingencies and risks to which fruit blossoms are exposed in this country are apt to create a great disproportion between the promise and the fruition. In some parts of Scotland the crop is a grand one. Many of the varieties are beyond average quality, and what is singular is that some varieties which are generally esteemed "regular bearers" are this year fruitless—a matter, however, of relatively little consequence, as the quality is apt to be disproportionate to the quantity. In the Southern and Eastern Counties loud complaints are heard of the ravages made by caterpillars, as already mentioned in our columns; and these it is evident must have occasioned serious losses. In a very general way the results of our enquiries, as summarised in other columns, are as follows:—

Apples are generally under average, except in the Home Counties.

Pears are also under average throughout the country, unless in the South-Western Counties.

Plums show a deficiency everywhere except in Wales and the Channel Islands. Apricots,

Peaches, and Nectarines, are in the same case as Plums.

Cherries, it is singular to note, have furnished a good average throughout the kingdom, except perhaps, in the South and South-West.

Small fruits are generally over average, even in the counties that are most deficient in Apples and Plums.

Strawberries are abundant, but have suffered from rain.

Nuts are under average, and especially so in Kent and Surrey.

The outlook as to the supply of home-grown winter fruit is hence far from good, and America and our colonies will be largely drawn upon to make up the deficiency.

Meanwhile, it is satisfactory to notice the increased attention paid to fruit culture and to matters connected with it. Already two Fruit Conferences are announced, one under the auspices of the Royal Horticultural Society, while another is being promoted by an independent committee of private growers.

The Fruit-conferences at Chiswick, undertaken at the darkest period of the Society's history, were so signally successful, and the reports founded on them of such permanent value, that it is fitting the old Society should once more take up the work it has done so well. Whether our Scottish friends intend again organising something of the same kind we do not know; their success in the past may induce them also to renew their efforts. One satisfactory feature about these exhibitions is, that they are not exhibitions only, but that endeavours are made to utilise and turn to account materials which at most shows are only displayed without comment.

At Chiswick the leading work to be accomplished seems to be the determination of varieties, the rectification of nomenclature, and specially the suitability of particular varieties to particular stocks, and to particular soils. At the Crystal Palace, on September 6 and 7, other matters are to be discussed—matters bearing rather on the commercial aspects of the question. The arrangements are in neither case complete; but we believe that at the Crystal Palace a beginning has been made by electing that able pomologist, Mr. T. F. RIVERS, as Chairman of the committee. One of the first proposals, as laid down by him, and cordially endorsed by the committee, was, that the Conference should have a permanent character, that its march was not to begin and end with a few trumpet blasts on Sydenham Hill, but that the committee should, as far as possible, promote continual inquiry and discussion as to the national development of fruit-culture, but especially in relation to those more useful and valuable of hardy fruits, Apples, Pears, and Plums. The committee agree that it is no part of its aim to discuss, or in any way to affect the mere garden-culture of fruits as at present so widely existing. Neither, we are glad to learn, does it propose in any way to trench upon what ground the Royal Horticultural Society may regard as its special preserve, or to conflict with that body in its operations.

What the committee has in view in promoting the various conferences which it is hoped will result is to popularise hardy fruit culture amongst agriculturists, with the ultimate expectation that we may grow at home fruit as plentifully and as good as is that which now finds its way here in such great profusion from other countries. Practically, the hope is that in time hardy fruit culture may become a national industry. Mr. RIVERS pithily said that were any one considerable county planted with fruit trees in proportion to the area allotted to other

crops, that all the nurseries in the kingdom could not at one time furnish more than the needful supply of trees for that one county.

It is not our purpose here to discuss the importance or otherwise of making hardy fruit culture a part of ordinary farm operations. That is practically the work for the Conference, and, no doubt, in due course it will be done well. Our readers may draw their own conclusions from the nature of the proposals made at the recent meeting of the committee with respect to the subjects to be discussed at the first Conference, and as to how far that body seems disposed to take a practical turn; for it was agreed that on the first day papers on "Land Tenure in its Relation to the Culture of Hardy Fruits," "Most Suitable Kinds of Apples, Pears, and Plums for Farm Culture," and the "Marketing, Packing, Transit, &c., of Fruit" should be invited; and also that such able men as Mr. ALBERT BATE, Mr. A. COLEMAN, and Mr. J. WEBBER, be invited to deal with them. On the second day the economical use of fruits is to be discussed, Mr. RIVERS himself undertaking to deal with the interesting subject of the "Drying and Bottling of Fruits, especially Plums." Mr. BEECH, the eminent jam-maker, is to be asked to deal with "Fruit as an Element for Jams, Preserves, &c.;" and Mr. W. S. MANNING will be invited to take up, on behalf of the Vegetarian Society, the "Adaptability of Fruit as Human Food." These topics show that, without being ambitious, the objects of the Executive Committee are severely practical. Further, that body has appreciably strengthened itself by adding to its numbers several well-known pomologists, and it will endeavour to secure the co-operation of the Royal Agricultural Society, as that body, it is well known, is desirous of promoting hardy fruit culture amongst farmers, if the best ways and methods be clearly indicated. It is hoped that a second Conference may take place when the usual October hardy fruit show at the Palace is held, as then a different body of fruit growers may be expected to be present; and we may go so far as to suggest, that the customary gathering of farmers at the Smithfield Cattle Show may also be utilised for some practical purposes in connection with this interesting subject.

It may occur to many that it is unfortunate that there should be such a dissipation of energy as is implied in two Fruit Conferences held simultaneously, or nearly so, in different quarters of London; and that it is but a poor return for the splendid work accomplished by the Royal Horticultural Society in its Fruit Conferences to organise similar meetings elsewhere; but sentimental considerations of this kind must needs give way in face of practical convenience and public utility, and the functions of the two bodies may be so sharply defined that each shall do its own share of the work without touching on the preserves of its neighbour. General principles and scientific pomology would, according to this arrangement, be assigned to the Royal Horticultural Society, while their application to public and commercial, as distinguished from private garden purposes, might be the work of the committee at the Crystal Palace. In any case, without indulging in any over-sanguine expectations—expectations which our climate, to say nothing of legal and fiscal restrictions, would soon dissipate—we may nevertheless express a decided opinion that much more fruit might profitably be grown here, and that fruit-culture may in some degree come to the aid of the distressed agriculturist, who hitherto has afforded so marked an example of the folly of placing all his eggs in one basket.

All success, then, to those who in any degree,

FIG. 10.--GROUP OF CARNATIONS AND PICOTÉES: REDUCED ONE-EIGHTH OF NATURAL SIZE. (SEE P. 103.)

and in any manner, contribute to the well-being of their fellows and the prosperity of the country.

**THE ROYAL HORTICULTURAL SOCIETY.**—The meeting on Tuesday last, of which we give a full report elsewhere, was, as has become customary of late, a remarkable one. Apart from the specialty of the day—the exhibition of the Carnation Society—particular mention should be made of the magnificent collection of Ferns shown by Messrs. W. & J. BIRKENHEAD, who had the enterprise to send from Sale, near Manchester, a collection which for variety and extent, we venture to think, has never been surpassed or even equalled in any London show. The herbaceous plants of Messrs. PAUL & SON, WARE, and VEITCH, were of excellent quality, while Mr. TALLERMAN's exhibit of a method of preserving Strawberries in a fresh state and of packing them for transport, attracted universal attention.

**COUNCIL MEETING.**—At a meeting held on July 24, a report was read, from the Chiswick Committee, concerning the National Apple and Pear Conference to be held at Chiswick Gardens, from October 11 to 18, and a schedule (which may be obtained of Mr. BARROW, Royal Horticultural Society's Gardens, Chiswick), was drawn up and agreed to. It was resolved that the Secretary have a proof of the new bye-laws printed and circulated amongst the Members of Council and of the Fellows' Committee, and that a meeting of the committee be called by its Hon. Sec. (Mr. DEAL), for Tuesday, August 14, to consider the corrections and alterations.

**COLONIAL FELLOWS OF THE ROYAL HORTICULTURAL SOCIETY.**—We have so frequently advocated the appointment of local secretaries and the formation of branches of the Royal Horticultural Society, not only in each county of Great Britain, but in each colony of Greater Britain, on the plan of the British Medical Association, that we insert the following letter with great satisfaction. The tie would be of the lightest, so far as any restriction is concerned, but the benefits would be mutual. Baron Sir FERDINAND VON MÜLLER, who is an Honorary Member of the Royal Horticultural Society, has been most assiduous and successful in obtaining Colonial Fellows for the Society. In a recent letter received from him he offers such practical and sensible suggestions that they are well worth while being placed on record for the consideration of Colonial Botanists and Horticulturists who may be desirous of joining the Society and thus give an impetus to the best interests of Horticultural Science. Sir FERDINAND writes:—

"I beg to express my great pleasure that my suggestion to obtain Colonial members for the Royal Horticultural Society has met with the approbation of the Council. If only a few of the leading horticulturists in each of HER MAJESTY'S Colonies had the honour of joining the great home Society it would add several hundred members to your roll, and would, irrespective of the financial support, give the Society greater strength from abroad. It seems to me if, in each of the Colonies, some prominent horticulturist were asked by you to propose such of his amateur or professional friends as he deemed worthy of the honour, a good representation of the colonial horticulturists at your Society would be speedily gained, and that with all the desirable decorum and dignity. In Victoria I will gladly take charge of this duty."

Steps are being taken to organise a representation of the Royal Horticultural Society in each of our Colonies. In the meantime, colonial botanists and horticulturists desirous of joining the Society may obtain forms of nomination and a list of privileges of Fellows on application to the Secretary, Royal Horticultural Society, 111, Victoria Street, S.W.

**THE "KEW BULLETIN."**—The July number contains an account of Bhabur grass (*Ischemum angustifolium*), largely used for making ropes, and

which might be used for paper-making if it were cultivated. Mr. FAWCETT's short but interesting account of the Cayman Islands, makes us hope we shall eventually get a fuller report from his pen. The disease in the Cocoa-nuts which he was specially commissioned to inquire into, Mr. FAWCETT attributes to a bacterium. With reference to *Valonia* (*Quercus agrifolia*), Mr. THISELTON DYER recommends its culture in Cyprus. Professor MACOWAN's remarks on the means of extirpating the Opuntias, Prickly Pear (which renders the land where it grows practically useless), or of turning them to advantage, are given at length. Other valuable information is given regarding the Opuntias, of much value to colonists.

**GARDENERS' ORPHAN FUND.**—We are requested to give insertion to the following letter:—"At the conclusion of the first year of our work it is a source of gratification to me to review the success which has attended our efforts, and which is due to the hearty co-operation of all concerned. I take this opportunity of returning my personal thanks to all associated with me in this matter, and also to the many gentlemen who have undertaken the office of local secretary, and worked so zealously in the cause. The dinner, as is now well known, was also a great success. Thanks to the numerous kind contributions of fruit, plants, and flowers, the room and tables presented an appearance which called forth unqualified expressions of admiration from the most competent and impartial critics. It now affords me no small degree of pleasure to be able to state that we are commencing the second year equally well. I am empowered to announce that Mr. SAEWOOD (Messrs. HURST & SON), in token of the interest he takes in this movement, has generously offered to place an orphan upon the fund at his own cost, in accordance with Rule 12, thus increasing the number of recipients from ten to eleven. The name and particulars of this annuitant will be announced in due course. It would afford me, and I may add, the committee, much pleasure if many more gentlemen were to emulate this noble example. I can only say that there are plenty of deserving applicants to whom such generosity would be of the utmost benefit. GEORGE DEAL (Chairman)."

**STATUE TO PLANCHON.**—We learn from the pages of the *Revue Horticole* that it is proposed to erect a statue in bronze at Ganges (Herauld), as a tribute to the great services of this eminent botanist. The first to recognise the nature of the Phylloxera, and one of the first, if not the first, to counsel the use of the American resisting stocks whereon to graft the finer French varieties, PLANCHON indeed deserved well of his country.

**"REICHENBACHIA."**—The second volume of Mr. SANDER's sumptuous publication contains coloured figures of various Orchids, artistically yet faithfully drawn, without straining after effect, while the analyses in wood engraving supply the necessary data for the botanist. These woodcuts, however, are rather roughly executed, and not on a par with the general "get-up" of the work. The text contains botanical descriptions by Professor REICHENBACH, and cultural details by Mr. SANDER, and is written in English, German, and French; while the strictly technical details are in Latin, so that the requirements of all parties are provided for. The following are the plants illustrated in the present number:—

*Odontoglossum Harryanum*, t. 49.—A magnificent species, discovered in New Granada by RODRIGUEZ PANTOCHA. The broad sepals are rich brown, pencilled with yellow lines. The petals are also brown with a narrow yellow margin, the lip, large, heart-shaped, oblong, with a central yellow keel from which radiate purplish stripes. Mr. SANDER recommends a cool, moist treatment in summer, keeping the plants somewhat drier after flowering, and repotting them when the new growths appear. In October the plants should be removed to a slightly warmer house, and there remain till April,

giving the same winter temperature as for *O. vexillarium*, viz., from 57° to 60° Fahrenheit.

*Dendrobium Leechianum* x, t. 50.—A hybrid raised by Mr. W. SWAN out of *D. nobile* by *D. aureum*. Five years elapsed before the seedling produced flowers. The flowers of this fine variety are remarkable for their undulated sepals and petals and for their large size ( $\frac{3}{4}$  inches across), "while the rich claret-purple of the labellum is intensified by the purity of the white margin." It is best grown in baskets, at a temperature in summer of 70°–80°, removing the plants into a cooler house when their growth is completed.

*Phalenopsis speciosa imperatrix*, t. 51.—A native of the Andaman Islands, where it was discovered by General BERKELEY. The flowers are of a deep rose-purple, with no white markings whatever, and the lip is adorned with bright yellow blotches on the side lobes. It is best grown in baskets suspended from the roof, and while in growth, requires considerable heat and moisture, and free exposure to light, taking care, however, to shade the foliage from the direct rays of the sun. During the winter season the temperature should not exceed 70°–75°. The plant flowers in August.

*Lelia Schilleriana*, t. 52.—The sepals and petals are of a white or light rose colour, while the labellum is exquisitely pencilled with purple lines and adorned with a heavy blotch of the richest purple-crimson. Mr. SANDER recommends it be grown in a shaded position in the Cattleya-house, with abundance of water at the roots during growth, but with much less during the dormant period. It should be repotted after flowering in early summer.

**RINGING THE VINE.**—M. GUSTAVE RIVIÈRE in the *Revue Horticole* recommends the practice of removing a thin band of the rind from a shoot some days before or during or immediately after flowering. The consequences are said to be the increase of the size of the berries, the hastening of the ripening process by twelve days, and the promotion of fertilisation. The ring should be taken off about 1 inch below the bunch—never above it. The decortication ensures a marked increase in the amount of sugar in the juice, as shown by the analytical tables given.

**AMERICAN BLIGHT ON APPLES.**—The last number of the *Revue Horticole* contains an excellent article, accompanied by a coloured plate illustrative of the woolly aphid (*Schizoneura lanuginosa*). A successful insecticide is the following:—Pyroligneous acid, 1000 parts; salicylic acid, 2 do.; red oxide of mercury, 1 do.; fuchsine, 0.25. One portion of this solution to thirty of water is requisite when the tree is in leaf; in winter it may be applied undiluted to the bark by means of a syringe.

**SUTHERLANDIA FRUTESCENS.**—With reference to the supposed use of *Sutherlandia frutescens* Professor MACOWAN sends us an extract from the *Cape Times*:—"I have had brought to me recognisable specimens of the plant now preconised as a remedy for cancer. It is *Sutherlandia frutescens*, a leguminous shrub, with showy scarlet flowers and large swollen membranous pods. Many will know the plant from remembering how children make playthings of these pods, plucking them with a piece of the footstalk adhering, and setting them upside down to float on water for toy 'ducks.' The outline of the pod thus treated is not unlike that of a water bird afloat. The plant is figured tolerably well in the *Botanical Magazine*, pl. 181, under the older name of *Colutea frutescens*. It is certainly a surprise to find any medical virtue ascribed to the *Sutherlandia*, and as many remedies for cancer have been pushed into notice, tried, and found wanting, that it would be well if our Medical Board would, by experiment settle once for all the reputed value of the application. From microscopic investigation of degenerated cancer tissue I entertain little hope of a successful result, but it is something to ascertain the unknown even when the equation works out  $x = 0$ . The plant used by the natives and by them pointed out to the old Dutch colonists as a remedy or pal-

lative, is quite different, and certainly has some powerful properties. It is *Melanthus major*, L., known as "Kruitje-voer-mij-niet," that is, herb-touch-me-not, from its heavy fetid smell. I believe it is only used externally. P. MacOWAN, F.L.S.

**CULTURE OF MORELS.**—We learn from *Le Lanterne*, a Falaishian journal, that M. Ozor, of Falaish, has succeeded in ascertaining by experiment the precise conditions of temperature and moisture which are required for the germination of the spores of these delicious fungi (*Morchella*). The species particularly experimented on is *M. conica*, and which M. Ozor succeeded in growing in April of the present year in his house at a period when it would be impossible to find the fungus out-of-doors. It has generally been supposed that Morels were parasitic on the roots of trees, &c., but this is not borne out by M. Ozor's experiments. The precise conditions under which this gentleman has succeeded in causing the spores to germinate, as it were, at will, are not indicated in the article in question.

**POPPIES.**—Mr. CADWELL, the Ivies, Wantage, Berkshire, sends us some forms of *Papaver pavoninum* of charming colours, and both double and single flowers. The thread-like petals, suggestive of Japanese *Chrysanthemums*, and the brilliant colour of the selfs and part-coloured flowers, make these annual plants pretty additions to the summer borders. It is a pity they are so evanescent.

**HAMMERSMITH AND DISTRICT HORTICULTURAL SOCIETY.**—This annual exhibition took place on the 19th inst., and a very pretty display indeed was made. Groups arranged for effect were a pleasing feature. The amateurs' exhibits were highly creditable, especially when it is remembered they are grown in some of the crowded streets of Hammersmith.

**A MONSTER MUSHROOM.**—It is stated in the *Surrey Comet* that a Mushroom was found on Mr. Bird's farm at Chessington, Surrey, which measured 16 inches across, was 4 feet round, and weighed 2 lb. 14 oz..

**OPENING OF THE GREAT NORTHERN HOSPITAL.**—We understand that on the occasion of the visit of the Prince and Princess of WALES to Holloway to open the Great Northern Hospital, the whole of the floral decorations and three bouquets were furnished by the liberality of Mr. B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, N.

**ACACIAS.**—Baron VON MCLELLER's valuable *Decades* proceeds steadily. It comprises a series of useful illustrations of a genus as remarkable botanically as economically, and of which many species are inmates of our conservatories, where their beauty in spring is always attractive. In *Acacia Sutherlandii*, *A. umbrosa*, and *A. Bidwillii*, the connective of the anthers often or occasionally ends in a gland, as in *Prosopis*. Very notable among these plants are also those of the section *Archidendron*, of *Albizia*, one species having as many as fifteen fruitlets in each flower. This apocarpism—a rare occurrence among Leguminosae—occurs also in a Papuan genus allied to *Afonsea*, and lately described by Dr. SCHUMANN.

**RHODODENDRON FALCONERI.**—When lately at Wolverton, we were surprised at seeing, in the woodland walk there—a walk full of interesting things—a plant of this species, which Mr. SHEPPARD told us had stood out many years, and has suffered little or no injury during the winter or spring, but which has not yet flowered, although it had a blossom-bud on it this season. This bud, owing to its soft, succulent nature, was no doubt killed by the frost, although the wood-buds, which are nearly as large, but more pointed, always escape. Even without the flowers this *Rhododendron* is well worth growing, as its foliage is very massive, and highly ornamental, the leaves being nearly a foot long, and 4 to 5

inches wide, with the under-sides of a dark ferruginous hue, and the upper of a pleasing green colour. It would seem that *Rhododendron Falconeri* comes from a higher altitude than the other Sikkim kinds, as R. Edgworthii and Nuttallii were killed the first winter after being planted out, and yet the first-named has small, very hard wood. It has been exceedingly useful to the hybridist in raising new varieties, as many have emanated from it, both by making it the seed-parent, and by using its pollen, and it is a valuable plant for the greenhouse.

**CHISWICK LITERARY AND SCIENTIFIC SOCIETY.**—On Thursday, the 19th inst., this prosperous local Society again held its annual garden party in the Royal Horticultural Society's Gardens, Chiswick, when there was a good attendance of visitors (about 700), who evidently enjoyed the promenade in the grounds. Microscopes, &c., and dried specimens of the British flora were exhibited by members.

**WEEVIL-EATEN BROAD BEANS.**—It is well-known that the Bean-weevil attacks Broad Beans during the time the seeds are ripening, and pierces them through and through. It is a common opinion that weevil-pierced Beans do not germinate, and owing to the drought of 1887 the weevil appeared to be more active than ever. Some of the London wholesale seedsmen had samples of Beans returned to them by their customers on the ground that they would not grow. In order to put this to the test, Messrs. HUNTS & SONS, of Houndsditch, E.C., planted one hundred of the very worst weevil-pierced Broad Beans, and a similar number of Beans without any such blemish—these were sown side by side at the new seed trial grounds at Springfield, Chelmsford, with the result that the plants are now in bloom and setting their pods, and there is not a particle of difference in the appearance of the plants. Not one appears to have failed; the growth of one is quite as good as the other in every respect. The experiment should set at rest, for this generation at least, the notion that weevil-pierced Beans do not germinate, always provided that the cotyledons only are pierced, and that the embryo plant be not injured.

**RAMIE FIBRE.**—M. NAUDIN has succeeded in cultivating this plant (*Bomarea nivea*) at Antibes, where it is quite hardy. *B. utilis* is also hardy along the Mediterranean coast, and might furnish two or three cuttings every year; hence the introduction of these fibre-producing plants into Algeria or Corsica might be of great value. The leaves, moreover, make excellent fodder for cattle.

**KEW.**—The refreshment pavilion in Kew Gardens is being built by the refreshment contractors to the Royal Albert Hall, and will be opened to the public on August 2. The site chosen is on the east side of the Pagoda Vista, and not far from the Temperate-house and Miss Norton's Gallery. It is also stated in a Richmond paper that "a new gate at the bottom of Lichfield Road, which faces the Kew Gardens Station, will shortly be opened, and put the gardens within five minutes' walk of the station." We believe the pavilion is being erected at the cost of the refreshment contractors, who are to pay a gradually increasing rent for the sole right to sell refreshments in the gardens during a term of years.

## CARNATIONS AND PICOTEES.

Our illustration on p. 101, fig. 10, shows on a somewhat reduced scale three varieties of Picotees and five of Carnations. The Picotees at the bottom of the woodcut are—the one on the right, Princess Alice, a red-edged variety; and that in the centre, Rev. H. Mathews, a pink-edged flower—both of Kirkland's raising. The Carnations shown are show flowers, and include the three-coloured flaked Rose of Castile, still to be found amongst show flowers. It will be observed that the flowers do not present the primness of the exhibition card, but are in the condition in which they were cut from the plants, a condition more agreeable to many of the profane than the artificial regularity of "dressed" flowers.

## NOTICES OF BOOKS.

**CHOICE BRITISH FERNS, THEIR VARIETIES AND CULTURE.** By Charles T. Drury, F.L.S. (Upcott Gill, 170, Strand.)

Mr. Drury deserves all credit for his endeavours to revive and quicken the interest in British Ferns. It is one part of a horticulturist's duty to popularise his subject, using the word in its best sense, and to demonstrate, amongst other things, that horticulture is not the sole appanage of the rich, and that it may be practised with but few of the means and appliances which a professed gardener, with more or less reason, deems necessary.

The cultivation of hardy Ferns may be recommended, in the first place, for their extreme beauty—this appeals to every one; next, for their deep interest—this appeals to the more intelligent; and, lastly, for the ease with which, with few exceptions, they may be grown—this commends them to the amateur with but little time and, perhaps, less means to devote to the pursuit of plant growing. The circumstance that a very complete collection is now grown at Kew—which establishment has also come into possession of the rich herbarium of our late colleague, Thomas Moore—will doubtless serve to recall attention to this exquisite class of plants. People will want to know how to collect and how to grow them; they will develop an eclectic taste, picking out the best (for where all are good some are better than others), and for this purpose they will find no better guide than this book of Mr. Drury's. What are called viviparous Ferns are common enough, e.g., in *Cystopteris bulbifera*, but no special significance had been attached to this adventitious production of buds; till a similar phenomenon taking place either from the prothallus developed in the ordinary way from a spore, or from a corresponding production developed direct from the frond without the intervention of a spore, awakened the attention of botanists interested in tracing the descent of Ferns from pre-existing forms, and in illustrating their relationships with other groups. By bringing these facts to light, fernists, such as Mr. Wollaston, Colonel Jones, and Mr. Drury himself, have contributed very materially to the solution of a problem of very great interest and importance, and have shown of what value may be the well-directed observation of amateurs. Some portion of Mr. Drury's work appeared originally in these columns—a fact which, while it precludes the necessity of our making extracts from the book, may serve as a good reason why we venture to commend the completed book to the notice of our readers!

### THE PANSY.

Mr. Alexander Lister, nurseryman, of Rothesay, has published through Mr. A. Gardner, of Paisley, a treatise on the cultivation of the Pansy, in which he deals clearly and simply with their propagation by seed, and by cuttings, the means to be adopted by exhibitors, and the course to be followed when greenfly, or spider, or mildew, attack the treasured herb. Pansies are so exquisite in their colours, and so easy to grow, that we gladly hail any means of extending their cultivation, and look forward, not without hope, to a time when good taste shall sweep away the present arbitrary convention as to form, and the fashion set in towards accentuating and developing that which Nature has prescribed for an excellent purpose in this particular flower, rather than force her to give to a Pansy a form she never intended it to have, and which in this case is meaningless.

**FLOWER-GARDENING FOR AMATEURS.** By Lewis Castle. Swan, Sonnenschein & Co.

This is a very serviceable little book, written in the fulness of knowledge by one who can pot a Heath or write a report with equal facility. The author tells his readers how to form town and suburban gardens, window gardens, wild gardens, and house-

top gardens; he discourses of soils, walks, lawns, beds, and borders. He tells us what to grow and how to do it, and all in a style very different from that of the mere inexperienced scribe who writes with a view to his own pocket rather than the benefit of his readers. With a view of testing the work we turned with interest to the chapters on town gardening and on the management of a small greenhouse, and found those subjects sufficiently and practically treated. The remarks on watering are excellent. The number of serviceable evergreens for town gardens might have been largely increased. *Skimmia*, *Osmanthus*, and the comparatively new *Phillyrea Vilmoriana* do admirably in the open air in the smokiest situations.

#### THE ROTHAMSTED EXPERIMENTS, &c. By William Fream, B.Sc., and Horace Cox.

Mr. Fream has done excellent service by summarising and condensing some of the principal results obtained from the unparalleled series of observations, experiments, and analyses, carried on at Rothamsted by Sir John Lawes and his *aide-de-camp* Professor Gilbert. The original records are hardly adapted for use by cultivators; moreover, they are voluminous, bulky, and scattered through various publications during a period of forty years. Mr. Fream has selected for summary those reports relating to the culture of Wheat, Barley, and meadow herbage, and he has done his task so well, that we hope he may be induced to continue his labours and give us similar summaries with respect to Potato and root crops, to the feeding of animals, to the relations between vegetation and climate, and other of the many subjects to which attention has been paid at Rothamsted.

#### FREESIAS FROM SEEDS.

PERHAPS it is not generally known amongst admirers of these charming bulbous plants that they can easily be grown from seeds, and be had in bloom about four months from the time of sowing. At the present time we have, standing in a cold frame, thirteen 6-inch pots, each containing eight to ten plants, raised from a packet of seeds sown about the middle of February last. All the plants have flower-stems, and a good many of the stems have one or two flowering branches springing from their sides. The first flowers began to open early last month (June), and from that time to the present there has been quite a profusion of bloom, filling the air with fragrance, particularly at night, to a considerable distance round the spot where the plants stand, and there is apparently much gaiety and sweetness still forthcoming.

Our packet, from the seedsman, was labelled *Freesia refracta alba*; but, besides white flowers, we have some with one to three petals marked with bright orange; other flowers are of a pale citron hue; these are larger than the rest.

The culture of *Freesias* from seeds is most simple, and appears to be devoid of the disappointment which sometimes attends their growth from bulbs. By sowing seed at intervals—say in February, April, and again in June—it would be easy to have a good supply of these flowers throughout the summer and autumn months. Besides, if properly treated after flowering, the bulbs of seedling plants would come in useful for forcing and growing the following season.

In sowing the seeds, the cultural directions printed on the packet were not followed. In our case an 8-inch pot was crocked, and filled with a mixture of loam, peat, and sand; after watering the surface, the seeds were sown and covered lightly over. The pot was then placed in a pit prepared for growing Cucumbers. In about ten days the seeds germinated, and as soon as the seedlings were fit to handle they were carefully taken from the seed-pot and pricked over the surfaces of some prepared 3-inch pots, eight to ten of the seedlings being dibbled into a pot. When filled, the pots were put back into the Cucumber pit, standing them on a

shelf at the back, near the glass. Here they soon became established, and grew very sturdy, eventually looking much stronger and healthier than plants we had grown from old bulbs. About the beginning of May, the small pots being full of healthy roots, a shift into a 6-inch pot was given them, using a compost of loam, peat, some fresh horse-droppings passed through a half-inch sieve, and some sand. In potting the plants the roots were disturbed as little as possible. They were now put into a cold frame, a mat being thrown over the glass at night. Water was given carefully at first, and the frame was kept rather close for a time. Soon after this shift some of the plants began to throw up flower-stems; when these had advanced in growth a little weak manure-water, prepared from stable-dung, was given, and the forwardest of the stems in a little time began to expand flowers, others followed in their wake, until we have had quite a mass of bloom for some weeks past. *J. W.* [The flowers sent with this note had stalks of 1 foot in height, were fully developed, and perfumed like Violets. *Ed.*]

#### DISEASE OF ORNITHOGALUM.

##### Puccinia Liliacearum, Duby.

A FEW weeks ago Mr. William Cross, of Lytham, Lancashire, was good enough to send to the office of the *Gardeners' Chronicle* numerous specimens of leaves of *Ornithogalum umbellatum*, L., infested with a fungus new to Britain, named *Puccinia Liliacearum*. He wrote:—"The disease is of a most virulent nature, and has completely killed thousands of plants in a few days." Mr. Cross was led to send this communication by seeing the account of *Ornithogalum naus, L.*, destroyed by *Heterosporium Ornithogali*, as published in the number of the *Gardeners' Chronicle* for May 26, 1888, p. 658. The accompanying illustration (fig. 11) will explain the appearances presented by the new fungus. On the right are the tips of two leaves of *Ornithogalum umbellatum*, L., thickly infested with the *Puccinia*, which grows on both sides of the leaves. It will be observed that the leaf-tips have been narrowed or contracted and dried up by the growth of the fungus within the leaves. Each leaf is covered with innumerable at first orange and then black pustules, which, on being magnified twenty diameters, are seen as in the centre of the illustration. The entire substance of each infected leaf-tip is filled with the mycelium of the fungus. The growth of the spores within the pustules at length bursts the epidermis of the leaf, as illustrated, and when ripe the spores are scattered out. The spores, which are larger in size than is usual with *Puccinia*, are shown enlarged 400 diameters at the bottom of the illustration; they are variable in both size and form, smooth, and bright yellowish or orange-brown in colour. An interesting account is given of this fungus, drawn up from examples forwarded by Mr. Cross, in the *Wesley Naturalist* for June, and written by the Rev. Hilderic Friend, of Carlisle. Mr. Cross' examples have been sent to the Natural History Museum, South Kensington. *Worthington G. Smith, Dunstable.*

#### CULTURAL MEMORANDUM.

##### SILENE PENDULA RUBERRIMA.

WHERE this annual is wanted for masses in the flower garden next spring, no time should be lost in sowing seed. Having placed a crock over each of the holes in the bottom of shallow boxes, strew a few handfuls of half-rotten leaves over them, filling to within an inch of the top with ordinary garden soil, or, better still, sifted waste soil from under the potting-bench. Make this firm and level with a piece of board, then sow the seeds thinly, and cover lightly; water through a fine rose, put into a frame and keep close until the young plants appear, when sufficient air should be admitted to prevent the

plants from making a weakly growth, and as soon as large enough, prick out in boxes or on a warm border, at from 4 to 6 inches apart, giving water through a rose, as before, to settle the soil about the roots. Thus treated, nice sturdy little plants will be secured for transplanting in the beds as soon as autumn frosts render the removal of their summer occupants necessary. Plants of the rose and white varieties of this showy and very useful spring-flowering subject may be raised in the same way as indicated above.

##### ROSA RUGOSA.

This Japanese Rose has a fine, distinct ornamental foliage, and the pure white flowers are very useful for cutting before they become fully open. Seeds may be sown in a box filled with sandy soil and covered lightly. When large enough, prick them out in a nursery bed, 6 inches apart, preparatory to being finally transplanted where they are intended to flower.

##### MIGNONETTE FOR WINTER AND SPRING FLOWERING.

This is a good time to sow *Mignonette* seed—Golden Queen and Garaway's White are two excellent varieties—to raise plants for cutting from during the winter and spring months. If for pot work, sow thinly in 4½-inch pots filled with sandy loam, covering lightly with some of the same, water through a fine rose, and stand the pots in a cool frame, shading from sunshine until the plants appear, when they should have plenty of light and air, and be thinned out to three in each pot; the object being to secure sturdy plants. If large supplies are required, a hot-water pit, having a south aspect, should be devoted to them, sowing the seed thinly over the bed, and afterwards admitting sufficient air to prevent the plants from making a spindly growth.

##### CELOSIA P. AMIDALIS PLUMOSA.

In order to raise a stock of plants of this showy decorative annual for he spring embellishment of stove and warm greenhouse, a pinch of seed should be sown forthwith in a shallow pan, covering it lightly with fine soil; water, and place in heat near the glass. When the young plants are large enough, prick them out 2 inches apart in a box filled with light rich soil; water, put back in heat, and shade for a few days from sun until the roots have taken to the soil; afterwards pot singly into 3-inch pots, and again into 4½'s before the roots become matted. *H. W. W.*

##### ANCHUSA ITALICA AND SEMPERVIRENS.

These beautiful Alkanets belong to the order of Borageworts, and the first named is a most desirable plant to have in the herbaceous border, where it grows from 3 to 4 feet high, and is strikingly effective on account of its exceedingly free floriferous habit, and the very rich deep blue of its blooms. These are about the size of a shilling, and for depth of colour rival those of the well-known *Gentiana acaulis*; and as there are so few plants that have flowers of that hue that attain much size, the *Anchusa italica* ought to be better known than it is. To have it do well the soil where it is to be planted should be broken up deeply, and have some rotten manure worked in below, to which the roots will go down and be independent of water when dry weather sets in. The way to propagate *Anchusa italica* is by seeds or off sets; the last named may be removed early in spring as soon as the leaves show, and the latter sown, when ripe, either in the open or under a hand-light, to be planted therefrom when strong enough, where they are to remain. *A. sempervirens* is a British species, and well adapted for growing in the wild garden or by the sides of woodland walks or drives, where it is very attractive and strong enough to take care of itself. *J. S.*

##### FOXGLOVES.

For the wild garden, or for forming clumps in the back of shrubby borders, these plants are unrivalled. Although there are several foreign kinds, there are none to equal our native species, or at least the improved forms of these, known as *Digitalis gloxini-*

flora, which have long towering spikes thickly studded with large drooping bell-shaped flowers, beautifully mottled or spotted in the throat. If seed be obtained from a good type of the one last referred to, much variety will be afforded, as many will come of different shades of purple, and others white, with rich markings, and the mixture of all these together is very pleasing, the plants showing well if planted on knolls. The time to sow the seed is as soon as it is ripe, when it should be gathered and dried, and at once scattered on ground that has been made smooth on the surface; this should then be covered with fine soil, and a handlight placed over; and the young plants when they appear should be fully exposed to the air. As soon as large enough to handle it will be necessary to prick them out in rows or beds, where they may remain to grow on till they are strong enough to plant out. Although Foxgloves do fairly well under shade, they are much finer in the open. In cases where it is desired to increase any that are considered extra good, cut away the spikes immediately the best bloom is over, when the plants will throw out side shoots, which when taken off carefully with roots, and planted and watered, will quickly become re-established, *J. S.*

## PLANTS AND THEIR CULTURE.

SUCCULENT PLANTS are those which have stems or leaves, usually thick and fleshy, and which are eminently suited to withstand long periods of drought. This property renders them useful for standing in places where more tender things would rapidly succumb. These plants are so dissimilar to most others in habit, that a fair proportion of well selected sorts gives an additional character to the collection, besides breaking the monotony, common to many other plants. Moreover, they are of themselves meriting of cultivation in every place where the necessary accommodation can be afforded them. They are mostly of easy cultivation, succeeding, where it would in cases be difficult to establish other plants—such as in covered corridors, balconies, where water cannot be freely used. A good soaking about once or twice a week being usually quite sufficient for their requirements; but in any case, however often they may be watered, it is important that it should only be applied when the plants are tolerably dry, and then giving a thorough soaking. At all times they should have as much direct sunshine as possible, with a good circulation of air, giving it more or less according to the temperature in which the different species are growing, but it is well nigh impossible to injure these plants with sun and air, provided the temperature for the warmer kinds is kept up. They may be potted at any convenient season, but in the case of such genera as *Haworthia*, *Gasteria*, and others, which are nearly annual-rooted, the sooner in the season that it is done the better. The soil best suited for them is a friable loam, with a good sprinkling of sharp sand and nearly one-fourth of the whole should be of pounded brick and old mortar. Well mix the compost, and in potting, firstly, remove any damaged or decayed leaves (if any) round the base of the plant, so that when the plant is stood in the pot the bottom leaves all but lie on the rim; the lowering of the plants induces the production of fresh roots. Ram the soil quite firmly, and especially round the sides and the collar of the plants. After potting be careful not to over-water. It may seem unnecessary to add that the drainage should be extra good. Of the score or so of genera—which go to make up the bulk of succulent plants—perhaps no genus is better known than the *Agaves*. *A. americana*—the so-called American Aloe—with its variegated variety, are two well-known plants, and nearly hardy. *A. americana picta* is a smaller form, with the variegation along the middle of the leaf, instead of at the edges, as in *variegata*; it is a distinct and handsome variety. Of more massive species, *sotolorum*, *Salmaniana*, and *Hookeri* may be mentioned; they are all

green, but vary considerably in the depth of colour. These are noble plants for large conservatories, winter gardens, and the like. Of a more accommodating habit is *A. striata*, and its varieties *A. striata* and *A. recurva*; they are handsome narrow-leaved sorts, somewhat similar to *Bonapartea juncea*.

*A. filifera*, with its white filamentous edged leaves and dense dwarf habit, is one of the best. There are several varieties of *A. filifera* differing in the quantity and length of their filaments. *A. Victoria Regina* is a small gem, taking many years to grow to about a foot high. The general aspect of the plant is similar to *A. filifera*, but it has no threads or filaments, and the leaves are more rigid, and nicely striped with greyish-white lines. *A. dasylirioides*, *A. Kerchovi*, *A. xylacantha*, and *A. lophantha*, are medium growers, and distinct sorts.

*Gasterias*.—Of this genus only a few are usually found in gardens, of which, *verrucosa*, *maculata*, *acinacifolia*, and *nigricans*, are the best. A sunny shelf in the greenhouse suits them best. The same position also suits the *Haworthias*, of which there are many beautiful species. They are all dwarf plants, rarely more than a few inches high, forming small dense rosettes of leaves, frequently beautifully marked with pearly incrustations. Amongst the

*M. Cladius*, however, being an exception, flowering, when in season, at all times.

Cactuses are all more or less succulent, but they vary very much in character, from the tiny *Mammillarias* to the stately *Cereuses*, such as *Jamacara*, *peruvianus*, *Tweedii*, and many others with their curiously spined, angled, or fluted, cylindrical stems rising, if allowed, to a great height, while others are of a trailing habit, such as *grandiflorus*, *nycticalus* and *MacDonaldii*—which produce their immense blossoms at night—there are also intermediate forms more suited to smaller structures, such as *Pilocereus senilis*, the Old Man Cactus, *Melocactus communis*, the Turk's-cap Cactus, the various *Echinocereus* and *Echinocactus*, with their curiously ribbed stems, clad with numerous tufts of formidable spines, which usually begets them the respect they require. These Cactuses are benefited by having a few degrees more heat when making their growth than is usual in winter gardens and conservatories; but if they are not required to grow much they will do very well in sunny corners of such structures, of course taking care that they are not over-watered, as this will cause decay sooner than a low temperature. For flowering none surpass the old fat leaf-like stemmed (*Phyllocactus*) sorts, such as *Jenkinsonii* and *anguliger*. Their flowers are not so large as some of the *Cereuses*, but they make up for this in quantity and in the time they last in flower. They are all propagated readily from offsets or cuttings, which are best put in a warm sand-bed; they soon root, and may then be potted up in the compost already recommended. Never shade them, and, unless when making growth, always water sparingly. They are easiest managed when a part of a house can be devoted to them. Many *Euphorbias* are very similar to the *Cereuses* both in appearance and treatment. *F. Ross*, *Blechningley*.

## THE HARDY FRUIT GARDEN.

STRAWBERRIES.—As soon as the fruit is gathered, the plants which are to remain for another season should have the runners trimmed off, and the mulching cleared away. The plants should then have some of the older and the useless leaves cut away, which will encourage the production of fresh growth, the plants becoming furnished with good healthy foliage again before winter, ensuring stronger crowns than would be the case if the plants were left untrimmed. I am no advocate for the removal of the whole of the foliage after the plants have done bearing, as I think it tends to weaken the crowns. The late varieties should have all the runners not required for layering taken off.

*Gathering Fruit*.—The weather of late has been the worst possible for this purpose, and where large quantities of fruit are required for preserving purposes, it is a difficult matter to catch them in a dry condition. The only way to meet the difficulty is, when a favourable day does occur, to put on all hands, and get the fruit gathered quickly. Here we are gathering Currants of sorts and spreading them out in the vineries to dry, as another week's wet weather would have spoiled half the crop. Red Currants for jelly making should be gathered as soon as the berries are just nicely coloured, and before they become deep red. Kentish Cherries will now need close watching, for to have them in a fit condition for bottling they require to be gathered just at a certain stage. The best way to ascertain when they are ready is to take a fruit or two, and while holding the fruit in the left hand, pull the stalk with the right, and if it comes away easily, with the stone attached, the cherries are gathered. The better.

Strawberries for bottling whole must be gathered while firm, which is before they are fully ripe, otherwise they will not keep. The Oxonian is one of the best varieties for this purpose.

*Grafted Trees*.—These had better be looked to, and if the scions are growing well the bindings may be removed entirely, taking care that on trees in the open the young shoots from the grafts are properly secured against damage by wind, and if the scions have made about 3 feet of growth the points should be pinched out.

Wall trees should have young shoots properly trained to fill their respective positions, and all the laterals pinched in to one or two buds, taking out the points of the shoots when they have made about 3 feet of growth.

Cordon trees may be allowed to grow as much as they will, merely keeping the laterals pinched. *A. Ward*, *Stoke Edith Park, Hereford*.

FIG. 11.—PUCCINIA LILACIFERA. (SEE P. 101).

best sorts may be mentioned, *margaritifera*, *radula*, *clariperla*, *attenuata*, *cuspidata*, *cymbiformis*, *Reinwardtii*, *retusa*, *tortuosa*, *tessellata*, *arachnoides*, and *coarctata*; these are best grown in small pots.

Aloes are nearly allied to *Haworthias*, but, with one or two exceptions, they are not so ornamental; and requiring as they do a few degrees more heat, are not so accommodating. Moreover, they have a larger habit, and do not nearly do so well. Nevertheless, where succulents are appreciated a few should be included—especially the dwarfed, prettily-marked-leaved kinds, such as *Saponaria albocincta*, *Greenii*, *serra* and *tricolor*. *Cilia* is a good flowering species, and makes a good pillar plant; frutescens also flowers well, and may be trained into large bush form for placing in the conservatory in winter. There are many other greenhouse succulent plants worthy of being included, such as *Cotyledon arbores*, *Senecio pyramidalis*, *Sempervivum*, and *Mesembryanthemum*, some of which are singular looking plants, with merely a pair of connate leaves so closely applied that there is only a slight elliptical opening left between them, as seen in nuciforme and truncatellum. Another section of them, of which *M. tigrinum* and *felinum* may be instanced, with their large toothed leaves, in little rosettes and solitary yellow flowers. The flowering *Mesembryanthemum* are showy, but their only opening in sunshine is against them.

## THE KITCHEN GARDEN.

**TURNIPS.**—A good breadth of these useful vegetables should now be sown for giving a supply throughout the winter. This sowing will produce roots of a moderate size that may be relied on to keep sound during that period of the year. Red Globe (Veitch's) is undoubtedly one of the best varieties for this purpose, but it is also advisable to sow a small quantity of Chirk Castle for latest use. The fact of this variety keeping firm longer than any other white-fleshed turnip overrules any objection on account of its black skin. It is not necessary to make any great preparations for this crop, and as a rule manure will not be necessary unless the ground is very poor, and if any be given it should consist of bone-dust or something equally rich in phosphates in preference to anything that contains much nitrogen. A piece of ground from which an early Potato crop has been cleared will be suitable, forking over lightly, breaking it down well and levelling it, and the seed should be sown in rows 2 feet apart, and the plants thinned as soon as they are ready, leaving them 9 inches apart in the rows. It is well to sow plenty of seed in case the flea should attack the plants, and if that should occur give a good dressing of wood-ashes and soot in a dry state when the leaves are damp, and repeat as often as may be necessary. An occasional hoeing to keep down weeds will be all the attention the crop will require until full grown. All Cabbage beds should be cleared of stumps, &c., as soon as possible after cutting the heads, or considerable impoverishment of the ground to no purpose will ensue; but if it be deemed advisable, a few rows only may be left to form sprouts, these often proving very useful early in the winter after the Savoyers are used. *W. H. Divers, Ketton Hall, Stamford.*

## HOME CORRESPONDENCE.

 Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists. Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**PASSIFLORA EDULIS (GRENADILLA' FIG).**—A fine example of this stove or warm greenhouse climber growing a 10-inch pot stood on the border in the corner of a small house at Common Hill, Mrs. Clay's pretty place, near Ilfracombe, trained up the back wall and down one of the rafters, and carrying a very heavy crop of fruit, is well worthy of notice in the pages of the *Gardeners' Chronicle*. The roots have pushed through the pot into the border, otherwise a plant having its roots confined to a 10-inch pot could not possibly support such a spread of foliage and heavy crop of fruit as the one observed is carrying. Mr. Dadds, the gardener, states that the fruit is much appreciated for dessert when eaten with cream and sugar. When fully grown it is about the size of an ordinary Elruge Nectarine, having a horny skin, which turns from a glossy green to brown when the fruit is ripe. The fruit contains a large number of seeds, and possesses a peculiar flavour. The species can be easily raised by seed or cuttings put in in the ordinary way in a hotbed or any other structure affording heat and moisture, shifting the young plants into larger pots, as they require more room at the roots, using a compost of four parts sandy loam and one of leaf-mould. It is a rapid grower, but the shoots should not be stopped—only thinned out to prevent crowding. If fruited in pots liberal surface-dressing of Beeson's manure should be given once or twice a week before giving water at the roots while the plants are swelling their fruits. *H. W. Ward.*

**TURNING PLANTS OUT-OF-DOORS.**—The beneficial results of this practice are much more marked if the subjects have been prepared for the change; if this has not been done, the plants are apt to lose about as much as they gain. Although the temperature outside may be as high as that maintained indoors, yet generally the difference in humidity is so different, that should bright sunny weather follow, the plants are very likely to flag, when if remedial measures are not immediately applied, much injury may be done. A capital plan is to have a sort of skeleton greenhouse or frame over which a shading is spread,

and which can be rolled up in the usual way when not wanted. This shading is also extremely handy to let down in the autumn nights when there is likely to be danger from frost. Thick Hessians or "Porfir Scrim" is good cheap material to use for this purpose—or, better, if some of the mineralised shadings be used. These shadings will also throw off a considerable amount of water, if they are given a good slope, and fixed so that they are fully stretched when let down. It is also important that these plants are placed in such a position as to prevent their getting water-logged, and also the ingress of worms. It is a good plan to arrange the plants in lines, and standing the pots on a couple of parallel strips of wood, or similar contrivance, a few inches high; this method affords good drainage, and it is rather difficult for worms to gain entrance. After the plants are arranged in position, fill in the spaces between the pots with coal-ashes, or other plunging material. This protects the roots, and greatly reduces the amount of labour in watering. In selecting a site, choose a sheltered, yet open position, which with the aid of the appliances mentioned, many of the more tender Cape and New Holland subjects may be turned out with advantage. *F. Ross.*

**COLOURED POTATOS.**—If Mr. Grant will apply to Mr. R. Dean, Ealing, W., in the winter, he will certainly be able to obtain Rufus Potato through him; other growers may have it also. Some growers have a peculiar liking for coloured Potatos, and there can be no doubt but that some truly first-rate sorts beyond those named hide their goodness under coloured skins. Radstock Beauty, carmine blotched; Reading Russet, bright red; The Dean, violet; and the popular Beauty of Hebron, pink; are first-rate sorts, which it will be hard to excel. As the Vicar of Laleham Potato has received such excellent notice at Mr. Grant's hands, and is without doubt very widely grown, some sketch of its origin may not be out of place. The actual Vicar of Laleham, the little riverside Middlesex parish, where all that remained of Matthew Arnold was so recently laid to rest, was a few years ago the Rev. Mr. Peake. That gentleman, who has since beenat himself to another sphere of labour, was a real lover of Potatos, a raiser in a somewhat haphazard way of some seedlings, and withal a very genial gentleman. One autumn, a few years ago, he called upon me to show me three or four Potatos, small, but pretty, and of a purplish colour. They were the product of two very diverse parents—Fateron's Victoria, once such a popular and first-rate flatish white round, and of Red Emperor, a bad Potato, esteemed very handsome then, but a moderate cropper, and peculiarly subject to the disease. Everyone knows the origin of Victoria, but Red Emperor was no doubt of Brazilian origin, as I grew stocks of it once which had been brought home from Brazil. The few Potatos Mr. Peake brought me were left for growth the following year, and the produce, though not even then large, was excellent, and indicated a first-class variety. Mr. Peake called to see my produce, and finding I gave the new comer a good character, suggested that it merited a name. I agreed, and then he intimated that as we had a Rector of Woodstock he saw no reason why there should not be a Vicar of Laleham. That name was adopted for the Potato, and as such it has won honour for itself and some kudos, I hope, for its namesake and raiser. I always regretted that the Vicar was not a white-skinned variety. Had it been so it would long ere now have been one of the most popular of market sorts. As it is, it ought to find a big sale as a late spring stock in the market. I did not feel satisfied with the quality of the Vicar, as its flesh is hardly—in my soil at least—of that flaky, mealy quality which marked its parent the Victoria. A cross between the Vicar and that excellent but sparse-cropping white, Woodstock Kidney, however, gave in the Dean just what I desire, as I regard that as almost a perfect Potato. It is rounder than the Vicar, has a rougher coat, and of deeper hue, whilst its flesh is tinged with yellow like that of the Victoria and Woodstock Kidney. I have always found a little yellow in the flesh of a Potato indicated flavour, whilst too much not unfrequently meant closeness. I have therefore preferred the Dean to the Vicar, as the former is a distinct improvement. My experience of seedling Potatos has been, that really fine kinds often take three or four years to show their true characters—some take even longer. A promising kind may fail to give size in its tubers for three or four years, but presently the real character is fully developed, and it remains permanently fixed. The particular

Potato inquired about by Mr. Grant—Rufus—is a seedling from Early Rose crossed with Mr. Fenn's small but good red kidney, Bountiful; that also has a yellow tinge in the flesh, and although, like Bountiful, the tops are not very robust, the tubers are large and of even size; they materially resemble those of Vermont Beauty when it was first grown in this country. It is not unnatural that crosses between white and coloured Potatos should produce sorts of such colour, and of intermediate shades, but it is unusual to find two coloured kinds producing pure white forms; that has often happened in the course of my crossing and raising experience. I have usually found the pollen parent to be the most marked in its effects upon the produce, but there is no absolute rule. We have such a wealth of good Potatos, however, that it is very difficult to raise any better ones. *A. D.*

**NECTARINES IN SUCCESSION.**—I herewith enclose three fruits of Violette Hâtive Nectarine, taken from different parts of one tree; the branches of which are taken through holes in the partition into houses earlier and later than the one in which the tree is planted. The three successions have for several years finished satisfactorily. The earliest fruits commenced to stone when the latest were in bloom—a condition of things which I had previously some doubt of when applied to the Peach or Nectarine. It has, however, proved a valuable method of producing a succession of fruit from one and the same tree, and I send you the specimens in case any of your readers should doubt the possibility of the same having been accomplished. *Geo. Kennell, The Gardens, Fairlaw, Tunbridge, July 12.* [A very interesting case, as the roots were subjected to a uniform, the shoots to a variable temperature. The earliest fruit was dead ripe, one would require another fortnight, and the latest a month to be ripe. Ed.]

**THE NON-WARRANTY OF SEEDS.**—Will you allow me to say a few words on this important subject to the retail seed dealer, and how the non-warranty clause first came about? As I was in some way connected with the first trial that took place in the Queen's Bench on the seed adulteration after the passing of the then called new Act to prevent the adulteration of seeds, the affair is still vivid in my memory, I may recapitulate a few of the facts, as appeared in the *Gardeners' Chronicle* special report at the time of the trial, and of which the retail trade appear not to have taken the least notice, and not until within the last year or two has the subject received any attention whatever. But the wholesale trade was alive to the matter, and hence the non-warranty clause. The case turned on the adulteration or colouring of Trifolium with sulphurous acid gas—or yellowing or old seed had been coloured to represent new growing seed, but of course was perfectly useless. I myself tested the growth of the seed, but on the trial that went for nothing; it was bought by sample, and, according to the judge's decision, though a fraud had been perpetrated, the bulk compared with the sample; though good or bad, that was immaterial so long as bulk and sample agreed. The bulk of the doctored seed came to hand at the end of the season; there was a great hurry about it—in fact, so urgent were the farmers that it was delivered to several at the railway station, never coming into the seedsman's premises, proving that the seed could have been tampered with only before transit, exonerating the seedsman from any blame, beyond error of judgment, which scores fell into besides the same season. He was the only man in the United Kingdom who protested against it and took the matter up on public grounds for the benefit principally of the farming community, and contested it in the Queen's Bench in London, thereby doing more service to the farmer than any man then living. Several samples and bulks of seed coming from the same source that same season were excellent in growth, throwing the seedsman off his guard. In the latter part of the season through the urgent demand, there was not time to test the growth, hence the error. After this trial the non-warranty affair appeared. As a witness I will narrate a few facts to show what the retail man may expect. I had with me a trial book of seeds showing the testing of 700 samples that season under the seedsman in question, to show it was the custom of good houses to test the growth of seeds before sending them out, the seedsman in question being very particular in this respect. But the judge wanted further proof than this, so I, myself, went to three of the principal London houses, asking them to come forward and testify as to the custom of the London trade testing

the growth of seeds before sending them out, but not one of these would do so. One gentleman who was for the opposition, was touched upon this point by the seedsman's counsel—he was connected with a London firm now defunct, and, I think the man likewise, but if he still lives he may remember stating that it was not the general custom of the trade to test the growth of seeds before sending them out; and this, in my impression, greatly injured the seedsman's cause. This very gentleman was a witness before the select committee of the House of Commons on the seed adulteration before the passing of the Seed Adulteration Act, and to inquiries there stated it was the custom of the London trade to test the growth of everything before it was sent out. Here was a man as a Government witness giving opposite accounts. Had the retail trade been half awake, as the wholesale trade were, this subject ought to have been followed up all through the country, and a society formed for their protection; I have for years seen the necessity of such a society, and the retail trade ought to have seen at once the necessity of protecting themselves. A single individual coming forward having experienced a gross fraud, showing his desire to serve the public with genuine articles, and fighting single-handed a powerful society—if there is a champion amongst seedsman he ought to be the one. I do not think it speaks much in favour of the retail trade to allow a single individual to be ruined in a good cause and a powerful society opposing. A society would not in any way benefit the trade, have entirely left the trade, as my card will show; but after being many years connected with the trade I still feel interested in it. Apologising for trespassing on your space. *Fair Play.*

**HAUTOIS STRAWBERRY.**—That this fruit does not find a place in our fruiterers' shops in our large towns is somewhat singular and disappointing, the flavour being much liked for its piquancy, even if the fruit at its best is only a small one. Many growers having been supplied with plants which were either male or female only, have necessarily not succeeded in fruiting it, and have condemned it as unfruitful, and this belief has spread—it not having become generally known that the male flower is produced on one plant, and the female on another. Given runners selected from a plantation in good bearing, and therefore of mixed sexes, the fruitfulness of a new plantation is assured, and when the plants are once possessed, the formation of new beds, whenever found necessary, presents no difficulty. I have found the plant do best on a border facing north, that is, behind a tall hedge or wall, so as to secure some amount of shade from the sun, and a cool soil; in warm positions the plants do not usually set their fruits so well, possibly because it sets its fruits rather late, when in the generality of summers the soil is getting in such positions exhausted of its moisture. A good distance to plant the runners is 1 foot apart in the rows, and the latter at 2 feet or rather more apart if the soil be good. It increases fruitfulness in the plants if the runners are allowed to root in the rows the first year, as then there will be no want of a due mixture of male and female plants. The plantation in the second year may have the alleys between the lines reduced to 1 foot in width, by permitting the rooted runners to extend 6 inches on each side of the original row. In the third year—it is not advisable to destroy the plantation until it is six or seven years old, as the runners of the new one is in full bearing—the alleys may be allowed to become overrun with the runners, and every third original row cleared out with the spade to form an alley between what will then be beds of two rows each. By following up this method of renewal, but in various ways, the plants may be kept in bearing for the time stated. As a manure for the Hautois there is nothing better in easily accessible materials, than leaf-mould and Mushroom bed dung spread over the plants during the winter. As the fruits are borne on tall stalks there is seldom any occasion to mulch the soil with short straw to preserve them from the dirt, yet in all dry soils a mulch is an improvement so long as the alleys remain open. Now is a good time to lay down plantations. *M. W.*

**WHAT IS AN "HERBACEOUS" PLANT?**—At p. 73 Mr. E. Jenkins asks the above question, but it is quite clear, from his remarks, that he has little or nothing further to learn on that particular point. To many persons, however, the term "herbaceous" is bewildering, and is the cause of endless disputes

at horticultural shows; such being the case would it not be better to substitute the word "perennial," so that the wording of a class in prize schedules may read thus—"Hardy perennial plants." There are now so many cauleoparic plants exhibited as herbaceous—under misapprehension of the word—that it seems to me the time has arrived for widening the field to admit them. Of course in a class worded as suggested it is quite possible for mistakes to occur sometimes, but I think they would be less frequent than they have been in the past. *J. Horsfield, Hedgesbury.*

**CABBAGES.**—I have seen during the past few days some few excellent new Cabbages, which bear special merits, and are well worthy of mention. At Messrs. Sutton & Sons' trial grounds, Reading, out of myriads of Cabbages in trial, and all having exactly the same treatment, there stood out specially early and excellent Sutton's Little Gem, a very dwarf emerald-green variety, very distinct, and with solid hearts, which seems to be a "gem" indeed in a large family. The second Cabbage is Sutton's Selected Dwarf, larger than the first, with hearts of the usual conical form, but every one so firm, white, and handsome that the variety commanded attention. I should regard this kind for garden use as a very prince amongst Cabbages. The plants will stand very close together, and for small gardens would prove a great boon. The selected stock of Sutton's Dwarf Blood-red, or pickling Cabbage, is also a very noticeable strain, and one which should for ever supersede the old huge leafy stocks of pickling Cabbages. If the heads are less big, they are firmer, deeper in colour, less hard in texture, and less strong in flavour. It is a very pretty as well as a very superior pickling Cabbage. At Heckfield Place Gardens, Mr. Wildsmith drew special attention to a Cabbage named Veitch's Earliest of All—of course a somewhat pretentious designation, because some other Cabbages which are smaller-headed are earlier; but for a large or rather good-sized garden Cabbage, it is, without doubt, a superb variety, not only because so good at all points, but so early for its size. This variety, whilst carrying fairly large, clean, solid-pointed heads, has very few outer leaves, and in that respect alone merits distinction. There can be no doubt that in the matter of Cabbages—thanks chiefly to the keen watchfulness of our seedsman in these sharp competition days—we are going ahead, and it is hoped in a fair way soon to obliterate all the large, big-headed leafy stocks. Mr. Wildsmith also had a few heads left of the French Early Etampes, a wonderfully good Cabbage, which, without doubt, will soon find its way—if it has not done so already—into our English trade lists. *A. D.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

**TUESDAY, JULY 24.**—The exhibition held in the Drill Hall, James Street, Westminster, in conjunction with that of the Southern Section of the National Carnation and Picotee Society, made a pretty display altogether, and fairly filled the table space. The best feature of the whole, apart from the special exhibits of the latter Society, was the fine collection of Ferns sent up by Messrs. Birkenhead, of Sale, Manchester. This was a surprise to many South country growers, and was greatly admired. The visitors during the afternoon were more numerous than on any previous occasion, since the Society removed from Kensington.

#### Floral Committee.

Present: G. F. Wilson, Esq., in the Chair, and Messrs. Shirley Hibberd, H. Herbst, J. Fraser, W. Bates, Rev. W. Wilks, T. Baines, R. Dean, C. Noble, H. Ballantine, C. Pilcher, J. Dominy, H. M. Pollett, J. O'Brien, E. Hill, G. Paul, B. Wynne, and Dr. Masters.

The Chairman contributed from his garden at Wisley flowers of hardy Lilies of strong growth. These were giganteum, Brownii, Martagon in three vars., elegans, avenaceum, concolor, and Coridon, the latter from a bulb growing in a pot. Sprays of the showy crimson *Spiraea palmata* came from Mr. Charles Noble's nurseries, Bagshot.

A large group of stove and greenhouse plants and Orchids was contributed by Mr. B. S. Williams, Victoria and Laradise Nurseries, Holloway, and consisted of several fine species and hybrid forms of

*Cypripedium*, *Cattleya gigas*, *Masdevallias*, *Vanda* teres, two well-bloomed pieces of *Oncidium incurvum*, the spikes of bloom measuring from 3 to 4 feet in height; *Epidendrum cochleatum* was a good plant with ten flower spikes. Ferns, Palms, and *Dracenas* were interspersed as usual amongst the flowering plants.

Dahlias of the pompon, Cactus and single classes, and H.P. and T. Roses, were sent by Messrs. Cheal & Sons, Crawley.

Roses, both H.P.'s and Teas, in considerable numbers, and of capital quality, were shown by Mr. B. B. Cant, Colchester.

Gaillardias, Pentstemons, Delphiniums, Amaryllis, and mixed herbaceous flowers, were shown in quantity by Messrs. Kelway & Sons, Langport, Somerset.

Some cut blooms of *Pentstemon* in variety came from Messrs. H. Cannell & Sons, Swanley, some of which were of extraordinary good quality; we mention a few—Bertha Kosch, light rose-pink; Lord Chelmsford, scarlet and white; Alpd. Daudet, crimson; J. Robertson, scarlet, with a white tube; Dr. Tuke, one of the best, scarlet with white tube, striped inside with crimson. *Fuchsia triphylla*, a small plant, hung with orange-scarlet flowers in some profusion, was worthy of special notice amongst the Swanley plants.

A pretty *Lobelia erinus*, compact, and of the shade of blue of *Myosotis palustris*, came from Mr. H. Scott, Cambridge.

Mr. T. Smith, nurseryman, Newry, showed a good form of *Lycalis hybrida*, the parents, *L. flos-jovis*, and *L. coronaria* being shown alongside.

Seedlings of *Lilium elegans* in orange, orange-scarlet, and crimson colours, and each exhibiting some point of difference in the form of petal, were shown by Mr. W. Gordon, Twickenham. Other exhibits from him were *Iris Kämpferi* seedlings, the best being Kaiser Wilhelm, a white ground flower, striped and flecked with purple; and *Enterprise*, a purple flower, marked sparingly with white.

Messrs. W. Paul & Son, Waltham Cross, showed new Roses, the best were Duchess of Albany, a deep pink flower, a sport from La France, identical in other respects with that variety; Cheshunt Scarlet, a bright-looking flower, nice in the bud state; Brilliant, a H.P., was another of this kind—a deep crimson flower, of the admired Hazel-nut form of bud; Tea Rose White Lady, a French-white, excellent as a half-opened flower.

H.P. Rose Margaret Haywood was shown by T. B. Haywood, Esq., Woodthatch Lodge, Reigate; it is a full flower, of deep pink, with the delicious perfume of *Rosa Centifolia*.

Messrs. J. Veitch & Sons, Chelsea, contributed a group of uncommon and interesting plants. *Clethra alnifolia*, an old hardy shrub not frequently seen now-a-days, was shown in 6-inch pots, and as it produces its spikes of scented white flowers in great abundance and for a considerable period, is likely to grow in favour. *Yucca obliqua* was represented by a cut flowering head; the buds of this species are bright red, which, with the creamy-yellow of the interior of the flower, makes a bright appearance. A New Zealand shrub, *Notospartium Carmichaeliae*, with terete stems, bearing tufts of small bright rosy-lilac, pea-like flowers. There was a *Sturtia*, to which a certificate was given. It has flowers of a satiny-white, slightly fimbriated margin, and prominent yellow stamens, the flower being cup-like in shape; leaves oval dark green above, lighter beneath, tinged with brown in a young state. *Spiraea bullata*, of dwarf habit with red flowers, small deep green bullate leaves. *Acer distylum*, with red young growths; and *Sambucus nigra*, heterophylla with needle-like prolongation of the leaves. *Cytisus capitatus*, the flowers borne at the tops of the shoots, and a few specimens of hybrid *Rhododendrons* completed the exhibits. A certificate was granted to one of the *Rhododendrons*, named Purity, pure white.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, staged a collection of cut hardy flowers—*Liliums*, such as *L. Brownii*, *L. chalcedonicum*, *L. Humboldtii*, *L. Martagon*, and *L. candidum* being one of the chief features. There were also Iceland and Shirley Poppies, various Gaillardias, *Scabiosa caucasica*, *Helianthus janicus*, *Centaurea macrocephala*, and a Perpetual Carnation, Mrs. Crombie, creamy-yellow, with broad red edge shaded off into the yellow.

A group of a similar character came from Messrs. Paul & Son, Cheshunt, to which was added a collection of lilies in ten boxes, including several fine blooms of good varieties. The Shirley Poppies were

again shown here, and double and single Delphiniums in variety, also *Acillia aurea*, *A. millefolium rubra*, *Thalictrum flavum*, *Spirea aspidodora*, *S. palmata*, and *S. p. rosea*, both very fine; *Tropaeolum speciosum*, *Campanula pelviformis*, full of flower; *C. Waldenstamii*, *Cistus algarvensis*, *C. crispus*, were also to be seen.

*Bignonia Carrieri*, the flowers of which have a tube of yellow with bright rosy-lake lobes, was sent by Mr. F. Ross, Pendell Court Gardens, Bletchingley, who showed also *Veronica salicifolia* and *Sweet Williams*.

*Oreocome Candolei* was awarded a Certificate, it is an elegant umbelliferous plant of tall habit, suitable for a wild garden. Shown by Mr. C. Noble, Bagshot.

*Orchids*.—A specimen of *Laelia Amesiana* ×, with nine flowers on three spikes, came from Baron Schroder's garden, The Dell, Egham. It was well flowered, and obtained recognition from the committee. The rarely seen but beautiful *Saccolabium coleseste*, a plant with two spikes of its blue and white flowers, was shown by Mr. B. S. Williams. Plants of *Angulosa Ruckeri retusa*, a flower smaller than the type, and greatly compressed at the sides; and *Ondoglossum cristatulum*, were shown by Mr. H. Adams, gr. to R. B. Lemon, Esq., Moatbridge, Beckenham. Mr. Cowley, gr. to F. G. Tantz, Esq., Studley House, Shepherd's Bush, showed *Miltonia vexillaria asperba*, a rather small flower, of deep rose colour, and rich brown starry patch towards the base of the lip; Mr. W. White, gr. to C. Dorman, Esq., Lawrie Park, Sydenham, exhibited *Angulosa Ruckeri alba*, a finely-scented species; and *Epidendrum vitellinum majus*, with robust spike and large blooms. From Messrs. F. Sander & Co., St. Albans, were *Bollea Wendlandiana*, a flower pale yellow, base of lip a deeper shade of colour, and hood white. Another rare plant was *Laelia Eyerianiana*, (see fig. 12, p. 109), a probable natural hybrid between *majalis* and *autumnalis*. *Cypripedium Stoelei* acrocephalum, a flower pressed into the form of a flattened canoe, was shown by Messrs. Seeger & Tropp, of Lordship Lane, East Dulwich. The two lateral sepals are here disjoined.

Messrs. W. & J. Birkenhead, of Sale, near Manchester, staged a very fine collection of Ferns, which, while being one of all the fine examples of good culture, contained several quite new and many exceedingly rare species; indeed, it may safely be said of them that seldom if ever has such a varied and interesting group of these elegant and graceful plants been staged at a London show. The group was made up of over 1000 plants, many of them extra-sized specimens, and contained over 100 British and 250 exotic species and varieties. In the fine selection of British Ferns staged alongside the more tender kinds the fact was demonstrated that our isles give varieties which are in every particular worthy of association with the exotics. Few Ferns can exceed the beauty of the finer forms of our *Athyrium Filix-femina*, such as *A. F.-f. acrocladum*, *A. F.-f. plumosum*, *A. F.-f. elegans*, and *A. F.-f. todeoides*, of which fine examples were exhibited. The crested varieties of *Polypodium vulgare* were well represented; that most beautiful *Filix Fern* like *P. v. trichomanoides*, and the crested and fringed *P. v. grandiceps*, *P. v. elegantulum*, *P. v. bifido-multifidum*, and *P. v. Prestonii* were seen, as also a massive and very cambricum, a large specimen of which stood behind it. *Lomaria spicata* had several interesting crested and imbricated forms; the pretty *Lastrea nemula* also appeared in a crested form. *Scolopendrium*, many handsome and varied, the certificated *S. vulgare crispulatum* being the most densely crested, as also was the *Lastrea montana ramo-coronans*, which also received the honours of a First-class Certificate among its section. The exotic species were truly a representative group, in which many of the genera were well arranged for comparison; for example, over a score of *Davallias* were staged, among them being fine specimens, from the pigmy *D. parvula* and *D. alpina* to the noble *D. solida*, *D. retusa*, and *D. plumosa*. A fine specimen of *Davallia tenuifolia Veitchiana* was certainly one of the most graceful, while *D. Mariessi*, *D. M. cristata*, *D. Tyermannii*, *D. bullata*, and *D. dissecta* represented fine basket plants or for suspending. *Gleichenias* were well represented, and the climbing *Lygodium dichotomum* was a noble specimen. *L. palmatum*, *L. microphyllum*, *L. japonicum*, and others appeared. *Nothochloena* and *Cheilanthes* also had representative groups of most praiseworthy culture. The new *Nothochloena Muelleri*, with densely scaly under, and scattered scales on the upper sides of the fronds, received a First-class Certificate. Other

noteworthy things in this fine group, over which many an admirer lingered, were *Gymnogramma schizophylla gloriosa*. The collection of *Adiantums*, *Adiantopsis radiata*, *Onychium auratum*, *Doodia media crispa*, *D. aspera multifida*, *Cheilanthes gracillima*, *Lomaria fluvialis*, *L. falcata bipinnatifida*, and the pretty light-violet-scented *Aspidium fragrans*. Now that Messrs. Birkenhead have broken the ice let us hope the metropolis may see their beautiful Ferns again.

#### FIRST-CLASS CERTIFICATES.

To Mr. J. Douglas, for border Carnation Elaine.  
To C. Dorman, Esq., for *Angulosa Ruckeri alba*.  
To Messrs. W. Paul & Son, for *Rose Duchess of Albany*.  
To Mr. B. S. Williams, for *Saccolabium coleseste*.  
To Messrs. J. Veitch & Son, for *Rhododendron Purity*.  
To Messrs. J. Veitch & Son, for *Stuartia species*.  
To Mr. C. Noble, for *Oreocome Candolei*.  
To Messrs. Paul & Son, for *Rose Paul's Cheshunt Scarlet*.  
To Baron Schroder, for *Laelia Amesiana* ×.  
To Mr. W. Gordon, for *Iris Enterprise* and *I. Kaiser Wilhelm*.  
To Mr. R. Dean, for Carnation Scarlet Bedder.  
To Messrs. W. & J. Birkenhead, for *Nothochloena Muelleri*.  
To Messrs. W. & J. Birkenhead, for *Scolopendrium vulgare cristatum*.  
To Messrs. W. & J. Birkenhead, for *Lastrea montana ramo-coronans*.

#### MEDALS.

*Silver-gilt Banksian*.—To Messrs. Paul & Sons, for group of plants.

*Silver Banksian*.—To Mr. B. R. Cant, for cut Roses; to Messrs. B. S. Williams, for group of Orchids; to Mr. T. S. Ware, for collection of cut flowers; to Messrs. W. & J. Birkenhead, for collection of Ferns.

*Bronze Banksian*.—To Messrs. Kelway & Sons, for *Delphiniums* and *Gaillardias*.

#### Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. J. Lee, J. Cheal, R. D. Blackmore, J. Barnett, G. T. Miles, W. Marshall, W. Denning, T. B. Haywood, T. J. Saltmarsh, J. Willard, J. Smith, and J. Roberts.

Messrs. J. Veitch & Sons, Chelsea, showed a collection of dishes, and also plants of *Fig Negro Largo* in fruit, one of Knight's large red Currant, heavily laden, but for size this variety is behind *La Versaille*, of which a dish was shown; also *Raspberry Superlativa*, large, and of good flavour; *Strawberry Waterloo*, a very large and handsome fruit; with *Cherries*, *Kenton*, *Hogg's Red*, *Geon*, *Elton*, *Black Hawk*, &c.

Messrs. Paul & Son, Cheshunt, sent a specimen of *Eleagnus longipes* in fruit; and also a dish of the fruit stewed; it is extremely acidic, and is not likely ever to become a favourite garden fruit in England. *La Versaille* red and white Currants were well shown by Messrs. Paul. A collection of eight varieties of *Strawberries* were sent by Mr. W. Allen, gr. to Lord Suffield, Gunton Park, Norwich, the fruits being large and of fine appearance. The following varieties were well represented:—J. Veitch, *Grimson Queen*, *Unser Fritz*, *British Queen*, and *Sir C. Napier*. From the gardens of the Society at Chiswick came several dishes of Currants—*Defiance*, *larged*; *Red Cherry*, do.; *White Dutch*, and *Champagne*, pink, being specially fine. The *Waterloo Strawberry* was also shown well.

The Commercial and Agricultural Co-operative Society, Limited (D. Tallerman), showed *Strawberries* gathered twelve days before which had been preserved by cold storage, and also a method of packing fruit for travelling, consisting of small cardboard boxes packed in a wooden crate. Other minor exhibits do not merit particular mention.

#### National Carnation and Picotee Society (Southern Section).

JULY 24.—The late season, the wet dull weather, and the sunless time, all operated to bring about an exhibition of Carnations and Picotees that sufficed to fill only a few yards of tabling. It was found extremely difficult to make up a stand of twelve distinct varieties, and it was only growers of large

collections who could attempt to do so. The flowers were uneven, rough, wanting in purity of the ground, and in general refinement. But the growers did their very best, in order to maintain the prestige of the Society.

*Carnations*.—There were but two collections of twenty-four blooms in not less than twelve varieties, and throughout the exhibition it could be observed that the display was made up by a very few exhibitors. Mr. Charles Turner was 1st, and in giving the names the two twelves making up the stand were taken separately, reading in lines from left to right; the flowers were—Sarah Payne P.P.B., Mars S.B., H. K. Mayor C.B., Juno P.F., John Keet R.F., James Douglas P.F., James McIntosh S.B., Mr. Brown R.F., Mayor of Nottingham P.F., William Skirving P.P.B., Sir Garnet Wolesey P.P.B., E. S. Dodwell C.B., Sybil R.F., Henry Cannell S.F., Jessica R.F., Mrs. Perver R.F., Prince George of Wales P.F., and Clipper S.F., a few of the foregoing being shown in duplicate; 2nd, Mr. James Douglas, gr. to F. Whitebourn, Esq., Great Georries, Ilford, with James Douglas P.F., Sybil R.F., Matador S.F., Seeding P.P.B., James Merryweather R.F., Sportsman S.F., Thalia P.F., Seeding C.B., Admiral Curzon S.B., Henry Cannell S.F., Squire Potts S.B., a very fine and promising flower; President of Corpus P.F., and Florence Nightingale P.F., with some of the foregoing in duplicate and several seedlings.

In the class for twelve blooms, dissimilar varieties, there were but two competitors, Mr. J. Douglas being again 1st, with James Douglas P.F., Sybil R.F., Mrs. Gorton C.B., Thalia R.F., Seeding P.P.B., Matador S.F., Florence Nightingale P.F., John Ball S.F., Sportsman S.F., Seeding C.B., Admiral Curzon S.P., and Duc d'Aumale C.B.; 2nd, H. W. Headland, Esq., The First, High Street, Leyton, with William Skirving P.P.B., Diana R.F., Harrison Weir C.B., Miss Gorton C.B., Thalia R.F., Sarah Payne P.P.B., Sybil R.F., Fred S.B., Sportsman S.F., James Douglas P.F., Florence Nightingale P.F., and Matador S.F. In the class for six blooms, dissimilar, there were four entries, Mr. C. Phillips, Hamilton Road, Reading, being 1st, with Tom Pouce S.B., a very fine variety raised by Mr. E. S. Dodwell; William Skirving P.P.B., Thalia R.F., James Douglas P.F., J. D. Hextall C.B., and Mrs. W. H. May R.F.; 2nd, Mr. C. Henwood, Hamilton Road, Reading, with W. Skirving P.P.B., James Douglas P.F., Thalia R.F., J. D. Hextall C.B., Mayor of Nottingham P.F., and Clipper S.F.; 3rd, Mr. Mark Rowan, Manor Street, Clapham S.F., Mr. Startup, Bromley.

*Single Blooms*.—In the class for single blooms there were comparatively few flowers; the best were scarlet biazars:—1st, Admiral Curzon, from Mr. J. Douglas; 2nd, James McIntosh, from Mr. C. Turner; 3rd, Arthur Medhurst, from Mr. H. W. Headland; 4th, Admiral Curzon, from Mr. J. Douglas; 5th, Fred, from Mr. H. W. Headland.

*Crimson Biazars*: 1st, W. M. Hewitt, from Mr. J. Douglas, and 2nd, do., do.; 3rd, Mrs. Whitebourn, from Mr. H. W. Headland; 4th, W. Wardill, from Mr. C. Phillips; 5th, J. D. Hextall, from Mr. H. Startup.

*Pink and purple biazars*.—1st, H. K. Mayor, from Mr. C. Turner; 2nd, Isaac Scott, a new Newcastle flower from Mr. J. Douglas; 3rd, H. K. Mayor, from Mr. C. Turner; 4th, Mrs. Gorton, from Mr. J. Douglas; 5th, Harrison Weir, from Mr. H. W. Headland.

*Purple flakes*.—1st and 2nd, James Douglas, from Mr. J. Douglas; 3rd and 4th, Juno, from Mr. C. Turner; 5th, James Douglas, from Mr. M. Rowan.

*Scott's flakes*.—1st, Matador, from Mr. J. Douglas; 2nd, Sportsman, from do.; 3rd, Sportsman, from Mr. H. W. Headland; 4th and 5th, Clipper, from Mr. M. Rowan.

*Rose flakes*.—1st and 2nd, Sybil, from Mr. James Douglas; 3rd, John Keet, from Mr. C. Turner; 4th, Thalia, from Mr. C. Phillips; 5th, John Keet, from Mr. C. Turner.

*Premier Carnation*.—The Premier Carnation selected from the whole show was Tom Pouce S.B., in Mr. C. Phillips' stand of six varieties.

*Picotees*.—There were two stands only of twenty-four varieties, not less than twelve dissimilar. The Picotees were greatly wanting in purity of the ground-colour, and while some blooms were stale enough, others required few days' longer development. Mr. J. Douglas was 1st with Her Majesty L.P.E., Favourite L. Rose E., Mrs. Sharpe H.S.E., Brunette, H. Red E., Miss Russell L. Rose E., Prince of Wales H. Red E., Constance Heron, H.S.E., John Smith H. Red E., Muriel H.P.E., and several seedlings. 2nd, Mr. C. Turner, with Juliette P.E., Favourite L. Rose E., Rival Purple H.P.E., Mrs. Nicholay L.P.E., Robert Scott L. Red E., Her

Majesty L.P.E., Mrs. Hanbury Rose E., Louisa L. Rose E., Miss Horner H. Rose E., Pico H.P.E., Emily Red E., Lucy L. Rose E., Princess Dagmar, H.P.E., Dr. Abercrombie H. Red E., and Mrs. Gibbons H. Red E., several of the foregoing being in duplicate.

In the class for twelve varieties there were but two competitors also, Mr. Douglas being 1st with Her Majesty L.P.E., Favourite L.R.E., Mr. Sharpe H. Rose E., Brunette H. Red E., Constance Heron H. Rose E., Princess of Wales H. Red E., Miss Rudell L. Rose E., Muriel H.P.E., and seedlings. 2nd, Mr. H. W. Headland, with Clara Pension L.P.E., Nymph L.P.E., Zerlina H.P.E., Favourite L. Rose E., Lady Holmesdale H. Rose E., Princess of Wales H. Red E., Ethel L. Rose E., Her Majesty L.P.E., and Muriel H.P.E., with seedlings.

In the class for six dissimilar blooms there were three stands, Mr. C. Phillips being 1st, with Juliette P.E., Favourite L. Rose E., Mr. Payne L. Rose E., Pico H.P.E., Her Majesty L.P.E., and Mrs. Dodwell H. Red E. 2nd, Mr. M. Rowan, with Clara Pension L.P.E., Master Norman H.R.E., Emily Red E., Her Majesty L.P.E., Countess of Wilton H. Red E., and Favourite L. Rose E. 3rd, Mr. H. Startup.

**Single Blooms.**—As in the Carnation classes, so here, the number of flowers staged was small. Heavy Red Edges.—1st and 2nd, Princess of Wales, from Mr. J. Douglas; 3rd, Mr. Robertson, from Mr. H. W. Headland; 4th, Brunette, from the same; 5th, Mrs. Dodwell, from Mr. C. Turner.

Light Red Edges.—1st, Violet Douglas, from Mr. J. Douglas; 2nd, Emily, from Mr. C. Turner; 3rd, Emily, from Mr. H. W. Headland; 4th, Seedling, from the same; 5th, Violet Douglas, from Mr. H. Startup.

Heavy Purple Edges.—1st and 2nd, Muriel, from Mr. J. Douglas; and 3rd, from Mr. Headland; 4th, Zerlina, from the same; 5th, Rival Purple, from Mr. C. Turner.

Light Purple Edges.—1st and 2nd, a charming unnamed seedling, from Mr. J. Douglas; 3rd and 4th, Clara Pension, from Mr. H. W. Headland; 5th, Her Majesty, from Mr. C. Phillips.

Heavy Rose Edges.—1st, Constance Heron; and 2nd, Lady Holmesdale, from Mr. J. Douglas; 3rd and 4th, the same varieties, from Mr. H. W. Headland; 5th, Mrs. Payne, from Mr. C. Phillips.

Light Rose Edges.—1st, Favourite, from Mr. J. Douglas; 2nd, Lucy, from Mr. C. Turner; 3rd, Favourite, from Mr. C. Phillips; 4th, Miss Flowdy, from Mr. J. Douglas; 5th, Favourite, from Mr. C. Phillips.

**Premier Picotee.**—This was Muriel, heavy purple edge, shown by Mr. J. Douglas. A Certificate of Merit was awarded to the unnamed light purple edge shown by Mr. Douglas.

**Selfs, Fancies, and Yellow Grounds.**—The yellow grounds, and especially the fine varieties, raised by Mr. J. Douglas, were shown in fine form; they are early to bloom, and thus proved an advantage in such a late season. Mr. C. Turner was 1st with twenty-four blooms, not less than twelve dissimilar, having of yellow grounds and selfs, Annie Douglas, Mrs. Reynolds, Hole, Almira, Colonial Beauty, Agnes Chambers, Dorothy, Terra Cotta, and Amber; of selfs and fancies—Purple Emperor, Ellen Burrows pink; Mr. Maclaren, in a run fancy form; and Sybil rose—several of the foregoing being shown in duplicate. 2nd, Mr. J. Douglas, with yellow grounds and selfs, Dorothy, Annie Douglas, Agnes Chambers, Almira, Janiera, Ada (heavily edged with a kind of salmon-brown), and Terra Cotta; Elaine, a lovely white self of great quality (awarded a First-class Certificate by the Floral Committee); Bride, white; Matador, a run scarlet self; and seedlings. 3rd, Mr. W. Toby, 3, St. Mark's Grove, Chelsea. There were but three competitors. There were two stands of twelve blooms, dissimilar, Mr. A. J. Saunders, gr. to Viscountess Chewton, Brockham Lodge, Cobham, being 1st, with a poor lot—rough and uneven; 2nd, Mr. H. Startup. There were two stands of twelve blooms of yellow grounds, not less than six dissimilar, and here Mr. J. Douglas was 1st, with a very fine lot of blooms unnamed; Mr. C. Turner came a close 2nd, with fine examples of Annie Douglas, Almira, Agnes Chambers, Colonial Beauty, Prince of Orange, and Dorothy in duplicate.

**Plants in Pots.**—There were three collections of twelve plants, dissimilar, Mr. Turner and Mr. Douglas showing in fine form; as in early flowering varieties in pots, Mr. Douglas' yellow-ground Picotees made a great hit. Mr. Turner was 1st, with plants carrying fine heads of bloom, having Pride of Penshurst, Amber, Agnes Chambers, Mrs. Maclaren,

Terra Cotta, Annie Douglas, Colonial Beauty, Prince of Orange, Howard's Yellow Self, Dorothy, Almira, and Purple Emperor. 2nd, Mr. J. Douglas, with unnamed varieties; 3rd, Mr. H. W. Headland.

**Miscellaneous.**—In the class of miscellaneous subjects, Messrs. James Veitch & Sons, Royal Exotic Nurseries, King's Road, Chelsea, had five boxes of cut blooms of Carnations, Picotees, selfs and fancies, including some capital flowers. Mr. C. Turner had a group of plants in pots, principally composed of yellow-ground varieties; and Mr. J. Walker, nurseryman, Thame, seedling Carnations, including a large white self of a promising character, named Duchess of Albany.

## NATIONAL ROSE: PROVINCIAL SHOW.

DARLINGTON, July 21.—With this exhibition ends, or very nearly ends, the show season of the Rose, for, with the exception of Tibshelf—a place of which, I daresay, few of the readers of this paper could tell the whereabouts—they have all passed away, and a more exasperating season it is impossible to imagine. All the elements of success seemed secured at Darlington; the arrangements for the show were perfect; the entries were very numerous; and yet here were some of those irritating adjuncts

FIG. 12.—LELIA EYERMANIANA: FLOWERS ROSEY-PURPLE. (SEE P. 91.)

which made it so different to expectations—there was in the neighbourhood of Darlington hardly a Rose to be seen. I went the day before through the garden of Mr. E. R. Whitwell, of Barton Hall, the chief promoter of the show, and who might have reasonably expected to make a good fight for the Trophy, and I do not exaggerate when I say there were not three Roses in his garden. Mr. James Backhouse, who generally shows in the class for twenty-four, could only muster half-a-dozen; in fact, never was so late a season known in the neighbourhood of Darlington. Then, again, Mr. W. J. Grant, who exhibited so successfully at Manchester and Wirral, and whose hopes pointed to the Jubilee Trophy, saw all those hopes literally dashed to the ground by a violent hailstorm, which smashed and cut to pieces all his cherished blooms; and then, to crown all, the morning opened most charmingly, and every one, notwithstanding some ominous clouds in the distance, looked hopefully forward to a fine day; but as I left Darlington rain fell, and continued for some time, completely marring the prospects of the show financially, and yet on the whole journey up to London there was not afterwards a drop of rain, nor had there been during the day.

And yet, despite all these drawbacks, the show was the largest ever held in Darlington, and but for the numerous fallings out occasioned by the uncertain weather, would have exceeded in size any exhibition held by the National Rose Society in the provinces, while the quality of the flowers was a matter of surprise to all who have had occasion to watch the un-

certainities of our most uncertain summer. The Roses were not, it is true, in such good character as at Wirral, but still they were very fine, and the dark-coloured Roses especially good. It was a great disappointment to Rose growers not to see Mr. Mark's seedlings of last year, especially Sir Rowland Hill, but, like Mr. Whitwell, his Roses were not in bloom.

**Some of the best Roses.**—I think it will be sufficient to note the Roses in the principal classes of the exhibition, and therefore give the following in the Jubilee class for nurserymen, thirty-six distinct blooms. The Trophy was again awarded to Messrs. Harkness & Son, Bedale, for Ulrich Brunner, Merveille de Lyon, Crown Prince, Lady Mary Fitzwilliam, Countess of Rosebery, Duke of Edinburgh, Baroness Rothschild, Marquise de Castellane, Auguste Rigotard, Madame Cusin, Comtesse Tretiakoff, David Pradel, a very fine bloom, Madame Gabriel Luizet, Souvenir d'Elise, Charles Lefebvre, Horace Vernet, Star of Waltham, Niphetos. Magna Charta, Souvenir de Paul Neyron, Madame Willemont, a magnificent flower, and I think the finest bloom I have ever seen of this variety, Madame Victor Verdier, The Bride, Prince Arthur, Devienne Lamy, Princess of Wales, Etienne Levet, Innocente Pirola, Duc de Wellington, Madame Caroline Kust, Duchess of Bedford, very fine; Marie Van Houtte, A. K. Williams, Catherine Mermet, Madame Marie Verdier, and Comtesse de Nadailac. This was a very fine stand, and the Teas, which had been grown under glass, were exceptionally good.

**Open Classes.**—In the class for seventy-two there was a very severe fight between Messrs. Paul & Son, Messrs. Cranston, of Hereford, and Mr. B. R. Cant, of Colchester; it took the judges a long time to decide, and ultimately it fell to the Cheshunt firm, with a very fine stand of flowers, consisting of Comte Rambaud, François Michelon, Marshall P. Wilder, very like Alfred Colomb; Baronne de Meden, Captain Christy, Senateur Vaise, Baroness Rothschild, Madame Eugene Verdier, Louis van Houtte, Souvenir d'Elise Vardon, Beauty of Waltham, Jean Ducher, Général Jacqueminot, Madame de Watteville, Barthelémy Joubert, Innocente Pirola, Exposition de Brie, Abel Carrière, Souvenir d'un Ami, Horace Vernet, Auguste Rigotard, A. K. Williams, Merveille de Lyon, Marie Baumann, La France, Madame Charles Wood, Paul Neron, Madame Alphonse Lavallée, Her Majesty, Marie Finger, Niphetos, E. Y. Teas, Comtesse de Nadailac, Prince Arthur, a very fine bloom; Madame Jean Perière, Dr. André, Ella Gordon, a good Rose; Susanne Radenaki, Marie van Houtte, Duke of Edinburgh, Charles Lefebvre, Etienne Levet, Comtesse d'Oxford, Countess of Rosebery, Edouard Hervé, Duchesse de Morny, Madame Legrance, Camille Bernardin, Madame Gabriel Luizet, Reynolds Hole, Caroline Kuster, Lord Bacon, a good Rose; Heinrich Schultheis, Ollivier Delhomme, Madame Victor Verdier, Alba rosea, Marie Rady, Emilie Huisberg, Rosieriste Jacobs, George Baker, Xavier Olibo, and Charles Lamb.

**Amateurs' Classes.**—Turning now to the amateurs' classes, we find that the same result takes place with regard to the Trophy—it remains with the winner of last year, T. B. Hall, Esq., of Larchwood, Rock Ferry. His stand of twenty-four was a very fine one, containing the following flowers:—Comte de Rambaud, a flower which has come exceptionally fine this year; La France, Louis van Houtte, Etienne Levet, Captain Christy, Jean Souper, Paul Neron, Merveille de Lyon, Dupuy Jamain, Rosieriste Jacobs, Baron Rothschild, Madame Victor Verdier, Beauty of Waltham, Anna Ollivier, Marie Baumann, Fisher Holmes, François Michelon, Dr. André, Le Havre, Grace Darling, A. K. Williams, Camille Bernardin, and Marie Finger.

In the class for thirty-six, the Rev. J. H. Pemberton was 1st, with Horace Vernet, Baron Gonella, François Michelon, Comte de Rambaud, Marie Verdier, E. Y. Teas, Duchess of Bedford, Caroline Kuster, Etienne Levet, Merveille de Lyon, Countess of Rosebery, Her Majesty, Marie Baumann, Grace Darling, Auguste Rigotard, Madame Lambert, Madame Victor Verdier, Reynolds Hole, Dr. André, Madame Eugene Verdier, Charles Lefebvre, Countess of Pembroke, Madame George Schwartz, Ulrich Brunner, Comtesse d'Oxford, Madame Gabriel Luizet, Marie Baumann, Princess of Wales, Exposition de Brie, Lady Mary Fitzwilliam, Marquise de Castellane, Comtesse de Nadailac, Star of Waltham, Catherine Mermet, Souvenir de Victor Hugo, and Lady Helen Stuart.

In the class for twelve, Colonel Standish Hore, of St. Asaph, was 1st; his success is very wonder-

ful; he grows only about 130 H.P.'s and forty Teas, and yet he competes in a class where growers exhibit who have some 800 or 1000 tees, and beats them too. His blooms are large, well-finished, and excellent in all points, they comprised Lady Mary Fitzwilliam, Prince Arthur, Duke of Connaught, Etienne Levett, Merveille de Lyon, Xavier Olibo, Catherine Mermet, A. K. Williams, Marie Baumann, Louis van Houtte, and Madame Eugène Verdier.

In the Tea and Noisette division there were many beautiful stands exhibited, those of the amateurs being ahead of the nurserymen, so I give the flowers in their classes. The Rev. F. R. Burnside was 1st in twelve Teas, with beautifully clear flowers of The Bride, Marie Bravy, Madame Cusin, Marie van Houtte, Comtesse de Nadailac, Catherine Mermet, Marchal Niel, Innocente Pirola, Hon. Edith Giffard, François Kruger, Jules Finger, Souvenir d'Elise. He was run very hard by E. B. Lindsell, Esq., of Beaton, with a box containing the following:—La Boule d'Or, Niphotes, Comtesse de Nadailac, Madame Cusin, The Bride, Catherine Mermet, Caroline Kuster, Princess of Wales, François Kruger, Innocente Pirola, Souvenir d'Elise Vardon, and Madame Lambard.

In the class for six Teas the Rev. Foster Mellier was 1st, with a good stand of François Kruger, Catherine Mermet, Madame Cusin, La Boule d'Or, Marie van Houtte, and Souvenir d'un Ami. The Silver Medal for the best Tea or Noisette in the amateur's division was awarded to Rev. F. R. Burnside, for a beautiful bloom of Marie van Houtte; and that for the best H.P. in the same division to E. B. Lindsell, Esq., of Beaton, for a beautiful bloom of Her Majesty.

The class for new Roses is always an interesting one, and on this occasion the 1st prize was taken by Messrs. Paul & Son, of Cheshunt, with Victor Hugo. This will be a general favourite. Comte de Paris, Lady Alice, Madame Joseph Desbois, bluish white, centre rosy; it was sent out as a hybrid Tea, but, like a good many, might as well have been called a hybrid perpetual. Madame Henri Perière, Madame Muscat, Her Majesty, Souvenir d'Alphonse Lavaleé, Lady Helen Stuart, Edward Heine, The Bride, and Miss Ebel Brownlow.

As before the arrangements were carried out most successfully by Mr. George Byers, the Assistant-Secretary under the superintendence of Mr. E. R. Whitwell, who, unfortunately, was not only not able to exhibit, but was prevented from taking as active a share as usual in the proceedings owing to an injury to the knee received while playing cricket with his children; but nothing could be better than the arrangements of the exhibition, and great credit is due to all concerned.

## THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING AUGUST 4. (AVERAGE OF FORTY-FOUR YEARS.)

July 29	...	...	63°·3	Aug. 2	...	...	63°·2
.. 30	...	...	63°·3	.. 3	...	...	63°·2

Aug. 1	...	...	63°·2	Mean for the week	...	...	63°·2

## THE PAST WEEK.

The following summary record of the weather for the week ending July 23, is furnished from the Meteorological Office:—

"The weather has continued dull and unsettled very generally, with local thunderstorms and frequent falls of rain.

"The temperature has been somewhat higher than of late, and in some parts of Scotland it has slightly exceeded the mean for the time of the year; in all other districts, however, a deficit is still shown, varying in amount from 1° to 3°. The highest of the maxima, which were recorded at most stations on the 19th, ranged from 67° in the 'Channel Islands' to 71° in Ireland, S., and to 77° in the north and east of Scotland. The minima were in most cases rather above their mean value for the time of year, but on some occasions they fell below it, the absolute minima varying from 40° to 42° in Scotland, from 47° to 49° in Ireland, and from 44° to 49° in England. In the 'Channel Islands' the lowest reading was 53°.

"Rainfall has been a little less than the mean in

'England, E.,' and about equal to it in 'Scotland, N.,' but more in all other districts, the excess in some localities being considerable. At Newton Reigny, during a thunderstorm on the 22nd, 0·42 inch of rain fell in the brief space of eight minutes.

"Bright sunshine has been very little prevalent, the percentage of the possible amount of duration ranging from 36 in 'England, N.E.' to 18 in 'England, S.,' and only 16 in the 'Channel Islands.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## NOTICES TO CORRESPONDENTS.

AQUATIC PLANTS: *Aquarium*. Mr. T. S. Ware, Hale Farm, Tottenham, grows many of the hardy species. Messrs. Backhouse & Sons, York, and J. Veitch & Sons, Chelsea, cultivate the tropical and tender species.

APPLES FALLING OFF TREE: *E. M. P.* It sets too many fruits. Another year try timely thinning, and mulch the ground over the roots with short

dung. If you do not manage to secure a crop soon, your tree will run entirely to shoots and foliage, and then there will be no other course for you to pursue but to transplant it.

AYRSHIRE ROSE: *E. M. P.* Your Rose has acquired a sportive habit. It will revert in course of time to its original sobriety of behaviour. Sporting is common amongst Roses.

BOOKS: *G. B.* Read the chapters on the "Life-History of Plants" in *Cassell's Popular Gardening*. Apply, stating your requirements to the Secretary, Science and Art Department, South Kensington.

CHRYSANTHEMUM LEAVES: *Amateur*. The leaves have been spoiled by the leaf miner. Whenever these grubs are seen making runs between the upper and lower epidermis of the leaf they should be crushed between the finger and thumb, and when very numerous cut off the leaves and burn them.

GARDENING BOOK FOR A BEGINNER: *J. E. T. Villa Gardening*, by Ed. Hobday (Macmillan & Co.)

GRAPE: *Anxious*. It is a bad case of shanking. Something is wrong at the roots, and should be put right early in the autumn. You can do nothing now to stop the loss of fruit from this malady. Healthy roots, large foliage, ripe wood, good ventilation and not excessive cropping, do not produce shanked berries.

HOLLYHOCKS DISEASED: *G. F. P., Egham*. Yours is a virulent example of the Hollyhock disease, as caused by the fungus named *Puccinia malvacearum*. All diseased material should be as effectually destroyed as possible. *W. G. S.*

INSECTS: *H. B. P.* Your Fern leaves are thickly marked with little reddish-brown spots. We could not discover the slightest trace of an insect; indeed, the spots are in a position where insects could not have attacked them, being at the junctions of the little veinlets, and along the midribs. *W. — D. D.* *Sirex gigas*; frequently to be met with in Fir trees.

MANUAL ON THE CULTURE OF HAZEL NUTS: *E. C. P.* We know of no treatise in the English language, but the cultivation of *Filberts* is pretty fully treated in *Profitable Fruit Raising*, by C. Whitehead, price 1s. Longmans, Green & Co., London; and in *Fruit Raising for Profit*, by G. Bunyard, price 1s. 6d., free by post. *F. Bunyard*, 29, Week Street, Maidstone. *Die Hazel Nuss*, by Goeschke, is the best book on the subject. It is in the German tongue.

MUSHROOM: *W. D.* A good specimen of a frequent monstrosity.

MUSHROOM GROWING: *Constant*.—Boxes and barrels may be used, also nursery flats (baskets). In putting in the materials, put in 6 inches of fresh droppings, levelled and trodden firm, then follow with 2 inches of adhesive loam, also pressed firmly, more dung, and so on till the receptacle is full. Get *Mushrooms for the Million*, by J. Wright, published at 171, Fleet Street, E.C.

NAMES OF PLANTS: *B. P.* 1, *Clematis flammula*; 2, *Cinchona Youngii*; 3, *Silphium laciniatum*; 4, *Aconitum Lychnis*; 5, *Lychnis coronaria*; 6, *Sedum spurius*. *W. A. C.* 1 and 2, *Adiantum concinnum-latum*; 3, *A. Pacottii*; 4, *A. Ludemannianum*; 5 and 7, *A. hispidulum*; 6, *A. affine*; 8, *Nephrolepis Bausei*; 9, *N. taberosa*; 10, *Gymnogramma japonica*; 11, *Adiantum decursum*; 12, *Polypodium longipes*. *W. C. H.* 1, a hybrid Pink; 2, 3, and 4, varieties of *Pergandium peltatum*; 5, *Lychnis chalcedonica*; 6, *Oxalis Martiana*; 7, *Primula obconica*; 8, *Panicum variegatum*. *W. W.* 1, we cannot name Roses; 2, *Adiantum formosum*; 3, *Campanula persicifolia*; 4, *Lychnis coronaria*. *W. V.* *Sorbaria xantholeuca*. *M. L. D.* The white flower is Passion-flower, *Constance Elliot*; the claret-coloured one seems to be a hybrid between *kermesina* and *racemosa*. *Lost*. *Diplopappus chrysophyllus*. *J. J. & S.* *Melanthus major*. *J. D.* 1, *Geranium dissectum*; 2, *Epilobium hirsutum*; 3, *Salvia Verbenaca*. It is not possible to attack the weeds directly, but by drainage and heavy cultivation you may encourage the grasses to the detriment of the weeds. *D. T. I.* *Cistus laurifolius*; 2, *Escallonia macrantha*; 3, *Lonicera japonica*; 4, *Cotoneaster microphylla*; 5, *Spiraea acutata*; 6, *Leycesteria formosa*. *S. Ray*. Ordinary wild *Muscus*. *A. B. C.* *Cirrhæa tristis*, probably, but the specimens are very bad.

ONTOLOGIUM CRATUM DISEASED: *W. E.* "W. E." sends a leaf thickly infested with brownish disease

pustules which bear a strong superficial resemblance to the pustules belonging to some Rust fungus, or Puccinia. This disease of *Odontoglossum* is caused by vast quantities of minute eel-worms, or nematodes, which feed and breed within the membranes of the leaf. The disease is fully illustrated and described in the *Gardeners' Chronicle* for January 9, 1885, p. 41. When the eel-worms cannot be seen in the actual pustules they may be readily found in the tissues of the leaf closely fringing the disease-spots. *W. H. G.*

**RUSTY GLOXINIA LEAVES.** *J. T. S.* The leaves have the appearance of having been syringed overhead, a proceeding very injurious to them and Gesneras. We detected no insects, although there were signs indicative of thrips.

**SIDE SHOOTS OF ROSES.** *W. A. G.* These may be thinned out, not by cutting all away indiscriminately, but selecting the strongest and best placed, and cutting out or pinching back the remaining ones. A short time must be allowed to elapse after growth has commenced before beginning the cutting out, &c., so as to be enabled to discriminate between weak and strong shoots.

**STRAWBERRIES SENT FOR NAME:** All arrived in a bad condition.

**VINE LEAVES.** *J. R. M.* The poorly-developed leaves are covered with the common Oidium, which can easily be kept down by any of the remedies for mildew, &c.

**COMMUNICATIONS RECEIVED.**—*T. Meehan*.—*J. R. J.*.—*H. M.*.—*W. J. G.*.—*W. A. H.*.—*J. S.*.—*C. B. S.*.—*H. T. W. Hayward*.—*K. Alick M.* (next week).—*H. E. J.*.—*C. T.*.—*D. T. Y.*.—*H. L.*.—*G. T.*.—*W. S.*.—*W. C.*.—*Beddi*.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

**DIED.**—We regret to announce the death of Mr. GEORGE ROBERT SOPER, a member of the firm of Corry, Soper, Fowler & Co. (Limited), which occurred on the 6th inst., at 300, Amburst Road, Stoke Newington, N.

—We have also to record the death of Mr. F. WHITBOURN, of Great Greaves, Ilford, on the morning of Wednesday, July 25. He had been in feeble health for a long time, but his death occurred quite suddenly.

The death, on July 17, of Mrs. JANE FISHER, the wife of Mr. Charles Fisher, of Handsworth, near Sheffield, is also announced.

## MARKETS.

### COVENT GARDEN, July 26.

Our market has been heavily supplied with soft fruit this week, especially Raspberries and Currants; but Cherries, owing to the wet, have arrived in very bad condition, and made low prices. Trade for hot-house goods quiet. *James Webber, Wholesale Apple Market.*

#### FRUIT.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.		s. d. s. d.
Cherries, half-sieve...	2 0-5 0	Melons, each	1 0-3 0

Marguerites, 12 bun.	3 0-6 0		

\*s. Orchid bloom in great variety, but the demand not very good.

#### SEEDS.

**LONDON:** July 25.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the continued wet weather which is doing so much harm to the growing crops of seeds has naturally exercised a hardening effect upon values generally. There is in consequence an increasing speculative inquiry for Trefoil, and also for Alsike and white Clover seeds. The new French Trifolium is of unsatisfactory quality. In bird-seeds there is no quotable movement. Blue Peas continue exceedingly cheap. Mustard and Rape-seed are unchanged. Linseed keeps steady.

#### CORN.

**Averages.**—Official statement showing the average price of British corn, imperial measure, in the week ended July 21:—Wheat, 32s.; Barley, 19s. 1d.; Oats, 17s. 4d. For the corresponding week in 1887:—Wheat, 34s. 3d.; Barley, 21s. 4d.; Oats, 17s. 9d.

#### FRUIT AND VEGETABLES.

**SPECIALTIES:** July 25.—Supplies continue to be large for all descriptions of vegetable produce, and demand satisfactory. Jersey Potatoes, especially flukes, are arriving in bad condition, owing to blight, hence low prices. Quotations:—Black Currants, 3s. per half sieve; red Currants 2s. to 2s. 3d. do.; Cherries, 1s. 6d. to 3s. do.; Strawberries, 1s. 9d. to 2s. 6d. per peck; Gooseberries, 2s. per half sieve; Raspberries, 3d. per lb. punnet; Raspberries, 18s. per cwt.; English Tomatoes, 3s. 6d. to 4s. per cwt.; Cabbages, 1s. 6d. to 2s. per supply; Peas, 1s. 6d. to 1s. per bushel; do., in sacks, 3s. to 4s. 6d. per sack; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, 1s. 9d. to 2s. do.; Spring Onions, 1s. 6d. to 2s. do.; Parsley, 9d. to 1s. 3d. do.; Mint, 1s. to 1s. 6d.; foreign Onions, 6s. to 6s. 6d. per box of about 130 lb.; frame Cucumbers, 2s. to 3s. per dozen; Endive, 1s. to 1s. 6d. per dozen; Cos Lettuces, 4d. per score of 12; Beetroot, 6d. to 8d. per dozen.

**STRAFORD:** July 24.—Supply has been good during the past week, and a brisk trade has been done at the following quotations:—Cabbages, 2s. to 3s. per tally; Turnips, 2s. to 3s. per dozen bunches; Mangels, 15s. to 24s. per ton; Apples, foreign, 8s. 6d. to 10s. per case; Watercress, 6d. per dozen; Peas, 4s. to 5s. 6d. per bag; Currants, black, 8s. 6d. to 4s. per half sieve; red, 3s. 6d. to 4s. do.; Gooseberries, 2s. to 3s. 3d. do.; Carrots, 1s. 6d. to 2s. per dozen bunches.

### MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

**MESSINGER & COMPANY, LOUGHBOROUGH.**

## GARDENING APPOINTMENT.

Mr. GEORGE KELF, for several years Foreman at Hindlip Hall Gardens, Worcester, has been appointed Head Gardener to T. J. WALLER, Esq., South Villa, Inner Circle, Regent's Park, London.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS**—In many instances Remittances in Payment of Repeat Advertisements are not sent, either by post, or by any other means, and the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remittances are sent to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS**—To Advertisers, Subscribers, and Others—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRYLY LINE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to present any person whose hands it may fall from negotiating it.  
N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, HEAD FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

To Nobleman and Gentlemen requiring Land Agents, STURTELL, STALLIFFS, or GARDENERS.

**JOURNEYMAN, or THIRD, in the Houses.**—Age 19; abtainer. Can be well recommended. Four and a half years' character.—HEAD GARDENER, The Gardens, Enfield Whiteknights, Reading, Berks.

**IMPROVER, under Glass.**—Age 22; good character. Premium given.—A. ALDERMAN, Duford, Buckhamham.

**IMPROVER, under Glass, in a good establishment.**—Age 18; with Premium. Four years' experience.—G. B. WILLIAMS, Foot-office, Enfield.

**IMPROVER, in the Houses.**—Age 20; energetic and obliging. Four and a half years' experience inside and out. Good character.—C. COBOLD, Woodland Cottage, Vanbrugh Hill, Blackheath, S.E.

**IMPROVER; age 17.**—Miss HODGSON, Herne-wood, Sevenoaks, highly recommends A. S. as above. Three years' good training under glass. Also C. T., age 16, height 5 feet 10 inches. Been four months in Nursery Garden.

**IMPROVER, in a private establishment, where** experience could be had indoors and out.—Age 20; two years in present situation. Good character.—H. COX, 2, Freetown Cottages, Darwlish, Devon.

**IMPROVER, in good Garden.**—Age 20; four years in last place. Experience inside and out. Strong and willing. Highly recommended.—W. BOATMAN, 21, Rainford Road, Chelmsford, Essex.

**IMPROVER, with any Nobleman's or Gentleman's** Gardener requiring the services of a young man (age 22). Has been in present situation six years, viz., Stawell House, Gardens, Richmond, Surrey; and can be highly recommended by Mr. Bowell, of the above.—W. STEVENS, Stawell House, Richmond.

**TO NURSERYMEN.**—Wanted, a situation under Glass, in a Nursery. Age 20; five years' experience.—R. WALLIS, Mather Lane, Louton, Lancashire.

**TO NURSERYMEN, MARKET GARDENERS, FRUIT GROWERS, &c., engaged in Forcing** Early Produce for Markets under Glass.—A young man wishes to learn the above business, for which a Premium would be paid.—Apply, stating terms and crops grown, &c., to H. S. 555, Messrs. Deacons, Leadenhall Street, E.C.

**GARDEN LAD, in Large Nursery or** Gentleman's Garden; age 17.—A GENTLEMAN wishes to find a situation for a bright, active, well-educated boy, whom he has thoroughly recommended, as above. Not been out before.—HORTUS, Mrs. Bretton, L.C.D. Station, Margate.

**MANAGER and BOOK-KEEPER, or HEAD** SHOPMAN.—Age 30, married; fifteen years' experience in leading Provincial Houses. Thorough knowledge of Seed and Bulb Trade. First-class references.—DUPEUX, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

### Seed Trade.

**MANAGER, HEAD SHOPMAN, or** BOOK-KEEPER; age 30.—Advertiser seeks engagement as above. Thorough knowledge in all branches. Fifteen years' experience. Excellent references.—C. A. VIZE, Chard, Somerset.

### To Florists and Seedsman.

**TRAVELLER, SHOPMAN, or MANAGER.**—Nine years in the Trade. Lately Travelled for a London House. First-class references.—H. 21, Shardloe Road, Lewisham High Road, New Cross, S.E.

**TRAVELLER, or BOOK-KEEPER, &c.**—Advertiser (age 28), with thirteen years' experience, including three years on the Road, desires to represent during a period of the year a good business, and his time during the remainder of the year in the Office or otherwise. Good Penman and Accountant; best of characters. Could introduce business when travelling.—TRAVELLER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

### To the Trade.

**SALESMAN in Market, SHOPMAN, or** MANAGER of Department.—Age 32; sixteen years' active experience in all Departments. Well up in Wreaths and Bouquets. Strong, active, and not afraid of work. Having small capital, would not object to join another. Splendid references and testimonials.—ALPHA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**SHOPMAN (HEAD, or good SECOND).**—Age 29; thirteen years' experience in London and Provincial Wholesale and Retail Houses. Thorough knowledge of all branches of the trade. Good references.—F. T. THOMAS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**SHOPMAN.—Married; thoroughly experi-**enced in all branches of the Trade and Office Work. Of good address. First-class recommendation.—ALPHA, 3, Loftus Road, Shepherd's Bush, W.

### Frutiterers and Florist.

**SHOPMAN (now disengaged),** twelve years' experience at W. E. Green, Grand Window Dresser.—J. F., 6, William Street, West Kensington, W.

**ASSISTANT, in Flower Shop.**—Age 23; can Speak and Write Foreign Languages. Has been four years in a Nursery.—B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**HOLLOWAYS' PILLS.**—Indigestion and Liver Complaints.—The digestion cannot be long or seriously disordered without the deperiment, being perceptible on the countenance. These Pills prevent both unpleasant consequences; they improve the appetite, and with the increase of desire for food, they augment the powers of digestion and assimilation in the stomach. Holloway's Pills deal most satisfactorily with deranged or diseased conditions of the many organs engaged in extracting nourishment for our bodies from our various diets—as the liver, stomach and bowels, over all of which they exercise the most salutary control. By resorting at an early stage of this malady to these purifying and laxative Pills, the dyspeptic is speedily restored to health and strength, and his sallowness gradually vanishes.

## SALES BY AUCTION.

Friday Next.

CATLEYA ELBORADO.  
CATLEYA SUPERBA SPLENDENS.  
IMPORTED AND ESTABLISHED ORCHIDS.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. F. Sander to **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT**, August 10, at half-past 12 o'clock precisely—

A grand importation of **CATLEYA ELBORADO**, in remarkably fine condition, with fresh green leaves, and plump pseudobulbs; the leaves and bulbs very much in appearance, and Mr. Sander does not doubt that many fine varieties will be flowered from this importation, such as splendens, Wallisi, aurea, carnea, conspicua, &c.

A few **C. SUPERBA SPLENDENS**, and this and **C. Eldorado** grow together, and from former importations we have flowered the magnificent natural hybrid **C. Brymeriana**, which combines all the grandeur and beauty of its parents, **C. Eldorado** and **C. superba splendens**.

A fine lot of other **ORCHIDS**, including **Oncidium undulatum**, **O. pyramide**, **Saccolabium Blumei majus**, **Sophranopsis grandiflora**, of which Mr. Sander has no doubt some very dark forms may be found; **Odontoglossum Cervantesii**, **O. nebulosum**, **Laelia purpurea**, **Cymbidium eburneum**, **Cattleya Bowringiana**, **Aëride**, **Fieldingii**, **Laelia alba**, **Oncidium micropogon**, **O. splendens**, **Odontoglossum Rosii**, **Dendrobium densiflorum**, **D. nobile**, **Laelia autumnalis**, **Oncidium species**, **Cattleya citrina**, &c.

The Sale will also include a quantity of **ESTABLISHED ORCHIDS** from private collections, and **IMPORTED ORCHIDS** received direct for unreserved Sale.

On view morning of Sale, and Catalogues had.

Friday, August 17.

**IMPORTANT UNRESERVED SALE** of the Second and Remaining Portion of the well-known **COLLECTION OF ESTABLISHED ORCHIDS**, formed by F. A. Philbrick, Esq., Q.C., of Oldfield, Bickley, who is relinquishing the cultivation of Orchids.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions to **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY**, August 17, at half-past 12 o'clock precisely, without reserve, the Second and Remaining Portion of this well-known **COLLECTION OF ESTABLISHED ORCHIDS**.

The plants are in exceptionally healthy condition, and this Sale includes a remarkable collection of promising **Odontoglossums** (unflowered, several celebrated varieties having appeared a long time), as well as some of the finest forms of **Cattleyas**, especially **Triane** and **Madagascariensis**.

**W. & J. BIRKENHEAD,**  
FERN NURSERY, SALE, MANCHESTER.

*Come and See.*

## OUR BEGONIAS.

Pray remember that for quality, distinctness, display, and immense stock, no other collection bears comparison. They are the finest ever seen, which is confirmed by the published statements of three of the greatest experts.

*Journal of Horticulture*, July 12, 1888.  
"I dropped in at Mr. Cannell's. It is impossible to exaggerate the beauty of some of the flowers which I saw. I had only time to run through the grand Pelargonium house, the Ivy-leaved Pelargoniums, and the single and double Begonias; but what a blaze of beauty there was! Then when one recollects the old Ivy-leaf Pelargonium, and sees the wondrous trusses of double flowers and beautiful colours which are yet to come out, we wonder what will follow. The same of Begonias. The marvellous single and double varieties are bewildering in their beauty. There was also a grand new Heliotrope, finer than anything I had seen. Had I been able to remain I should doubtless have seen many wonderful things, but I saw enough to convince me that the Home of Flowers is in no danger of losing its reputation."

*The Gardening World*, July 28, 1888.  
SOMERSETSHIRE EXCROCK says:—"I saw Begonias at Swanley. Their beauty well repays a visit; the shape, colour, and habit are excellent. If anything is wanted where everything is so near perfection it is a more upright flower-stalk, which a few more seasons will certainly produce."

*The Horticultural Times*, July 28, 1888.  
F. D. LYON, Esq., says:—"At Messrs. Cannell's establishment ALONE in all England can Begonias and Zonals be seen grown to perfection. With other collections of these families comparisons are odious."

**H. CANNELL & SONS,**  
The Home of Flowers, Swanley, Kent.

## H. B. MAY'S SPECIALTIES.

All the leading and most useful sorts; immense quantities in various sizes; also many new and rare species and varieties.

SATURDAY, AUGUST 4, 1888.

EARLY ENGLISH GARDENING.  
 II.

IT may not be uninteresting, at this point, to consider the laws and enactments that have been framed and passed in this country with reference to gardening. In this respect it has enjoyed the most perfect immunity, and presents a very remarkable contrast to an equally vital phase of life, viz., literature. Widely differing as they do, at a superficial glance, these two attributes of life and progress had a common origin, and the growth of the one found its reflection in the advancement of the other. But whilst one has been subjected to the "slings and arrows" of every worthless person who held office by virtue of his unscrupulous disposition, the other—that of gardening—has evolved from a primitive state, and developed into a science without the superfluous intermeddling of regal licensers and biased partisans. From the time of the Magna Charta down to the death of Queen Anne no more than two or three regulations were passed which have any bearing upon our present subject. In 37 Henry VIII., c. 6, sect. 3, for example, an Act called forth "by men of evil and perverse disposition," it is enacted that if any person "barke any Aple trees, Pearre trees, or other frute trees," a fine of £10 sterling should be inflicted. This sum would to-day be equivalent to about £50, so that such and collateral offences were neither few nor trivial. In the second example the much-abused middleman plays a prominent part. In the Act relative to victuallers and handicraftsmen, "not content with moderate and reasonable gayne," and who conspired to sell their "vittells at unreasonable prices" (2 & 3 Edward VI., c. 15), the first section ordained that the "costerdmongers or frewterers" should not sell their commodities but at certain prices. For the first offence the fine was placed at £10, or twenty day's imprisonment, with the luxury of a bread and water diet: for

## SEASONABLE GOODS.

See the best Catalogue out.

STEPHANOTIS, the freest variety in cultivation, 1s., 1s. 6d., 2s., 6d., and fine specimens to 63s. each.

ALLANIAS, Clerodendrons, Bougainvillias, Crotons, Gardenias, Ixoras, Ficus, and many others, 9d., 1s., and 1s. 6d. each; larger plants if wanted.

EUPHORBIA JACQUINLEFLORA and POINSETTIAS, 9d. each, 6s. per dozen.

CALADIUMS in great variety, very cheap, 6s., 9s., and 12s. per dozen. GLOXINIAS, 6s. per dozen.

GREENHOUSE PLANTS in great variety, 6s., 9s., and 12s. doz. TUBEROUS REGONIAS, coming in bloom, good plants, 1s. each, 10s. 6d. per dozen.

GERANIUMS, single, double, and Ivy-leaf, extra fine large plants, of lovely varieties, 12s. and 18s. per dozen; smaller plants, equally good sorts, for winter bloom, 4s. per dozen.

FUCHSIAS, Coleus, Heliotropes, Salvia, Abutilons, and other soft-wooded plants, in small pots, 2s. 6d. per dozen; in large pots, 4s. 6d. per dozen.

FERNS, best kinds for planting in Ferneries or for decoration, in small pots, 4s. doz.; in larger pots, 6s. and 9s. per doz.

ADIANTUM CUNEATUM, best for cutting, in small plants, 3s. per doz.; 21s. per 100; in good plants, 6s. and 9s. per doz.

TEA-SCENTED and other choice ROSES, in pots, grand plants and finest sorts, either for house decoration or planting in beds, 18s. per dozen.

PRIMULAS, CINERARIAS, CALCEOLARIAS, finest strains, young plants for growing on, from stores, 1s. 6d. per dozen, 9s. per 100.

CYCLOPS, young plants, 2s. 6d. per dozen.

ORCHIDS in variety, for either cool or warm house, 30s. and 42s. per dozen.

TABLE PLANTS in variety, 18s., 24s., 30s. per dozen.

ROSE VARIETIES, young plants to grow for winter, 4s. per dozen.

PRIMULA ALBA PLENA, the finest for cutting, 9s. per doz.

HERBACEOUS PLANTS, planted now in corner of garden, and moved in autumn, seldom die, 3s. per doz., 25s. per 100.

ROMAN HYACINTHS will soon arrive, many thousands already sold, 14s. per 100.

PAPER-WHITE NARCISSUS, 8s. per 100.

CLEMATIS, 10s. 6d. per doz.; HONEYSUCKLES, JASMINES, 9s. per doz.; IVIES, 6s. per doz. The best of all times now to plant these.

SEEDS FOR PRESENT SOWING.

See SEED CATALOGUE.

Wallflower, Silene, Myosotis, Canterbury Bells, Sweet Williams, Arabis, Aubrietia, 3d. and 6d. per packet. Lettuce, Onion, Cabbage, Cauliflower, &c., 6d. to 1s. per ounce.

 Stamford Nurseries, Bowdon;  
 10 and 12, MARKET STREET, MANCHESTER.

the second, £20, or the pillory; and for the third, £40, or the pillory, with the extra penalties involved in the loss of an ear, and being covered with infamy.

From this reign until the early years of the fourth George, nothing of any importance transpired in the legislature that affected gardening. By 7 and 8 George IV., c. 29, sect. 42, persons stealing or destroying, or damaging with such intent, any plant, root, fruit, or vegetable production, growing in any garden, orchard, nursery-ground, hothouse, greenhouse, or conservatory, are punishable summarily by one justice, with imprisonment for six months, with or without hard labour, or a fine not exceeding £20 over and above the value of the article stolen, or injury done; and for a second offence are guilty of felony, and punishable as in cases of simple larceny. And by sect. 43 of this same Act, persons stealing any cultivated root or plant, used for food for man or beast, or for medicine, distillery, dyeing, or for any manufacture, growing in land, open or inclosed, not being a garden, orchard, or nursery-ground, are punishable summarily before one justice; and for a subsequent offence may by two justices be ordered to be whipped.

Such, then, with one or two minor exceptions, are the laws and regulations relative to gardening, in the framing of which, it will be inferred, our forefathers underwent no great mental strain, for the very fundamental principles of the subject were so obvious, and so essential to the well-being of everyday life, that no extraordinary efforts were needed to perceive the wisdom of these laws. It is upon abstract theories and visionary data that our wise legislators become the most controversial, and fall soonest.

Gardening, like literature, may be regarded as the effect, rather than the cause, of centralisation. It would be a profitless task to seek for historical data much beyond the boundaries of towns and cities. And so it follows that the centres of civilisation are also the centres of gardening. The Universities in particular, took the lead in this respect. An historian of Cambridge has pointed out that a garden was laid out and planted so soon as possible after the foundation of the house, but utility, not ornament, was the motive at work. At King's Hall, Cambridge, in 1338-39, only three years after Robert de Croyland had sold his property to King Edward III., the wages of the gardener (*serviens in gardino*) occur in the accounts, with charges for nailing up and pruning the Vine, which was probably trained over the house. In subsequent years similar charges are frequent. In 1362-63 the ground between the college and the river was laid out as a garden, and a workman is paid at the rate of 3d. a day, four days, to make the beds (*herbaria*); but, with the exception of a charge for "Persily sed" in 1341-42, and for Saffron in 1338-84, the accounts throw but little light on what was planted in them (Willis and Clark's *Architectural History of Cambridge*, iii.). At Peterhouse, the account roll of 1374-75 shows that the kitchen garden contained, *inter alia*, Parsley, Cress, Garlic, Leeks, Saffron, and vegetables in general.

The work of "Thomas Hyll, Londoner," apparently kept all others out of the field until in 1577, Henry Binneman, or Bynneman, the publisher, issued *The Gardeners' Labyrinth*, which professed to contain "a discourse of the gardener's life, in the yearly travels to be bestowed upon his plot of earth," the choice of seeds and the "apte" times of sowing, and so forth. The information was gathered out of the most approved writers, from Pliny to Galen, and from Apuleius to

Hesiodus, by Didymus Mountain, and was edited by Henry Dethick. This very remarkable book, which appeared nearly twenty years before Gerard's stupendous work, is divided into two parts, each having separate titlepages and pagination, but with continuous signatures. The first, dealing with the subject generally, is in eighty-four pages, and the second, which is much more specific in its information, 180, excluding the indicatory "tables." It is dedicated to Sir William Cecil, and the copy now before us was formerly the property of Sir Joseph Banks. The first part contains eight quaint illustrations, but, with an economy which is beautiful in its utilitarian simplicity, one of these does duty no fewer than three times in the course of eighty pages, whilst another appears twice! the two full-page illustrations are most extraordinary, and well deserve to be reproduced if only to indicate the position of horticultural theorists three centuries ago. One illustrates "the manner of watering with a pumpe by troughs in a garden," and the other shows "the manner of watering with a pumpe in a tubbe," and of the two methods we shall not attempt to decide which is the more insane! To this first part, also, there are a dozen plans of various mazes and "knottes." The second and larger portion of this book only contains five illustrations besides the pictorial titlepage, and of these only one is a plant, viz., the Blessed Thistle. *The Gardeners' Labyrinth* is printed in black-letter type, and an edition of it was published by A Islip in 1594, and another by H. Ballard in 1608. *W. R.*

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### A LARGE FLOWERED NEW SPECIES OF TEA ROSE (*ROSA GIGANTEA*, Crépín).

In the report of the July meeting of the Belgian Botanical Society M. Crépín gives a full account of a supposed very fine new species of Tea Rose, which has been discovered by General Collet in the mountains between Birma and Siam. It has a pure white flower 5 inches in diameter, and differs from the common *Rosa chinensis*, Jacq. (*R. indica*, Auct.) by its single-flowered inflorescence, entire outer sepals, unarmed floriferous axis, and very large flower. It may prove to be an extreme variety of *R. chinensis*, but at any rate cultivators should look after it. It is fully described in M. Crépín's paper under the name of *Rosa gigantea*, Collett MSS.

### CATTLEYA LABIATA GASKELLIANA (*hort. Sand.*) ALBENS, *Rehb. f.*

I first received a specimen of this Orchid through the kindness of Professor Wittmack, of Berlin, the Editor of Regel's *Gartenflora*. It is described in the volume of the current year, and represented on plate 1274. It was raised by Mr. Franz Bluth, a distinguished orchidist of Berlin. Its origin was Sanderian. Notwithstanding the dislike which I usually have to pronounce an opinion on single *Cattleya labiata* flowers, I was finally convinced that this must be a Gaskelliana, wanting in its chief ornament—the characteristic blotch which is usually seen on the top of the lip, and I was right, as I see by a specimen of the same plant kindly sent me by Messrs. H. Low & Co. It originated from *Cattleya Gaskelliana*. The flower is of a very pale rose colour, and there is much yellow round the lip, and some scarcely recognisable brown lines are seen above the yellow. It is a most lovely variety. *H. G. Rehb. f.*

### CYPRIPIEDUM BELLATULUM AND C. EGREGIUM.

Messrs. H. Low & Co. have kindly sent me half-a-dozen very fine flowers of these plants, all having dark blackish-purple, sometimes quite black, spots on

the sepals, the lateral sepal being large and deflexed. The lip is usually narrow, whereas in *M. Godefroy-Lebenf's* types of *Cypripedium Godefroyi* it was hemispherical. All the staminodes are long and narrow, as in the first-named flower, but they are never triangular. One of these plants is most interesting, having a short nearly trilobed sepal and light purple spots, much resembling those on the type. Curiously enough, the spots in this variety are so light that they do not show on the other side of the sepals and petals. I propose to name it *Cypripedium bellatulum egregium*; it will be quite a treasure for our *Cypripedium* growers (s. v. v.). *H. G. Rehb. f.*

## HEUCHERA SANGUINEA.

This is one of the newer introductions, appropriately marked with a star as something especially good, in Nicholson's excellent *Dictionary of Gardening*, vol. ii., p. 140, figured in the *Garden*, vol. xxvi., p. 360, and in the *Botanical Magazine*, t. 6929. It is a low growing perennial, allied to the Saxifrages. Its general character is sufficiently indicated in our sketch (fig. 13, p. 125). The flowers are of a rich red colour; the leaves dark green and slightly marbled with a lighter tinge. It is a charming plant for the rockery or for the cool greenhouse, and was introduced from the Pacific slopes of Arizona and New Mexico by Mr. Ware. It was first made known to science by the late Dr. Engelmann. For the opportunity of illustrating the plant we are indebted to Mr. Gilbert Davidson, of Annanford.

## REMARKS ON THE FRUIT CROPS, 1888.

[For Tabulated Summary, see p. 95.]

### SCOTLAND.

ABERDEENSHIRE.—Fruit crops of all sorts suffered from the severe frosts in April and May. Small fruits blossomed abundantly, and, although much injured, are in most cases a fair average crop; Victoria Plums are a large crop, other sorts rather poor. Pears very poor. Cherries on some trees a good crop, others very few. Apples are a fairly good crop; but so late that only early sorts are likely to come to maturity. *J. Forrest, Haddo House.*

— I am sorry to say that the crops of fruit do not by any means look favourable at present. Owing to the cold spring everything is about three weeks later than usual, while on May 29 we had 10° of frost, which in general did much damage, nothing as yet having come to maturity. I can only speak of quantity. Apples look exceptionally productive. Plums—curiously, while the fruits of some are well advanced, many of the trees are now in bloom, *R. Farquhar, Fyvie Castle, Fyvie.*

— The fruit crops in this district are to be very limited, especially the early flowering kinds. Cherries, although abundant in the blossom, have set very badly, owing no doubt to the frosts every night. Plums, even Victorias, are very scarce, and did not show blossom well, and what came was killed by the frosts. Apples on standards are almost a failure, except some of the hardier sorts and some on walls. Gooseberries and red Currants look well; black Currants were very much thinned by the winds. Strawberries are looking well. *J. F. Smith, Dunceath Gardens, Aberdeen.*

BANFFSHIRE.—The fruit-tree blossom was retarded, and in some cases much injured, by a continuation of frosty weather, which set in here on February 13, which lasted to the end of March, with sharp frosts at night afterwards, occasionally intervening up to the end of May. Apple blossom, which seemed strong and healthy, suffered most, and the crop is, with few exceptions, a failure. These and Plums on walls are our worst crops. The weather up to this date has been cold and ungenial; everything in consequence is much behind in growth for the period. *J. Webster, Gordon Castle Gardens, Fochabers.*

DUMFRIES.—There were good prospects of a plentiful crop of all sorts of fruit up to June 14, when we were visited by a very severe hailstorm, which

riddled the leaves of vegetables, and stripped trees of fruit and foliage to such an extent that they will not fully recover this season. Since then we have had frequent severe frosts, which have hurt and retarded growth to a considerable extent. *J. Smart, Rachills, Lockerbie.*

**EAST LOTHIAN.**—The blossom on the fruit trees being a full fortnight late this year, made us think it would be safe from late frosts; but the cold north and east winds all through June, with 6° of frost once or twice, was more than they could stand. A great quantity of Apples and Pears fell off quite black after they were a good size. The leaves of our Apple trees are also very much hurt with the grub. Strawberries and small fruits are plentiful, if we only had good weather to ripen them; but July came in with the thermometer at freezing point, and, with the exception of one or two days last week, quite as unseasonable as June was. I question very much if some of the Apples and Pears, except on walls, will come to maturity unless we get a very fine autumn. *L. Dow, Newbyth Gardens, Prestonkirk.*

**FORFAR.**—Apples are good on young trees—very few on old. Pears much better than last year, and all small fruits most abundant. Strawberries are late, but it has rained continuously since Sunday morning, and that will carry them over the swelling process. It has been a dry cold season, and although there has often been brilliant sunshine during the day, sharp frosts have followed at night, 34° being registered on June 30, and the temperature was often as low during the month. Since then it has risen considerably. *J. Mitchell, Panmure Gardens, Carnoustie.*

**KINROSS.**—We have not had so late a season since 1879. Strawberries showed well, but are not setting. We have a full crop of Currants. Gooseberries are under average, but of fine size. Apples and Plums are very scarce. Everything is so late that I cannot honestly form any opinion as to the quality. *J. Fortune, Blair Adam.*

**MID LOTHIAN.**—The spring was cold and wet, and retarded the flowering period considerably, but since the end of March we have had no frost to injure any fruit blossom. The wood and buds were thoroughly ripened the previous autumn. The blossom opened in great vigour and profusion on most trees, and generally set well, except when cold and damp prevailed during the day. This to a great extent was the cause of the failure of Apples to set early in May, the varieties then in full flower, including such prolific sorts as Keswick Codlin, Duchess of Olden-burg, Warner's King, Manx Codlin, Cellini, Dutch Mignonette, &c., being almost fruitless, while those in full flower in the previous week set in great abundance, including many varieties that are by no means regular bearers in this district. The finest crops are borne by Ecklinville, Gravenstein, Tower of Glamis, Kerry Pippin, King of the Pippins, Oslin, Cambusnethan, Margil, Irish Peach, Yellow Ingestre, Golden Spire, Scarlet Nonpareil, Court of Wick, Golden Pippin, Sturmer Pippin, Early Strawberry, Melrose, Round Winter Nonsuch, Ringer, Loddington, Pott's Seedling, East Lothian Seedling, Beauty of Moray, Dutch Codlin, Frogmore Prolific, Cox's Pomona, and many other less known varieties. The following useful varieties are bearing good average crops:—Blenheim Pippin, Hawthornden, Stirling Castle, Golden Knob, Wellington, Lord Suffield, Cox's Orange Pippin, Worcester Pearmain, Alfriston, Thorne Pippin, Duke of Devonshire, New Hawthornden, Ribston Pippin, Improved Keswick Codlin, Dr. Harvey, Lane's Prince Albert, Yorkshire Greening, Lord Derby, Beauty of Kent, Shepherd's Fame, Maltster, Domino, Lord Grosvenor, Mère de Ménage, Yorkshire Beauty, Early Harvest, Braddick's Nonpareil, Grenadier, Devonshire Quarrenden, Galloway Pippin, and others of more or less merit. All are grown in the open as bushes and standards; and, generally speaking, the finest crops are on standards. Pears are, taken as a whole, the finest crop we have had for many years. The best varieties on walls are:—Marie Louise, Beurré d'Arenberg, Beurré Diel, Easter Beurré, Hacon's Incomparable, Louise Bonne

of Jersey, Glou Morçeau, Passe Colmar, Thompson's, Williams' Bon Chrétien, Winter Nelis, Doyenné du Comice, Beurré Bosc, Beurré d'Amanlis, and Red Doyenné. The following are bearing fine crops on standard trees:—Beurré d'Amanlis, Hacon's Incomparable, Catillac, Napoleon, Louise Bonne of Jersey, Williams' Bon Chrétien, Colmar d'Été, Hessel, Marie Louise, Flemish Beauty, Jargonelle, Doyenné d'Été, Croft Castle, Swan's Egg, Josephine de Malines, Easter Beurré, and many others of more or less repute; there being but few fruitless varieties this season that are worth growing for any purpose. The same remarks apply to Plums and Cherries. They are a fine all-round crop. The best standard Plums are Victoria, Pond's Seedling, Jefferson, Sultan, Rivers' Early Prolific, and Mitchelson's; the best on walls are Transparent Gage, Kirke's, Cox's Golden Drop, Jefferson, Reine Claude de Bay, and Victoria. Damsons are also a full average crop, the common, Prune and Farleigh varieties all bearing equally well. The best crops of Cherries are on May Duke, Black Tartarian, Frogmore, Early Bigarreau, Governor Wood, Elton, Bigarreau Napoleon, and Morello, all on arches; and on bushes and standards, May Duke, Archduke, Black Tartarian, Nouvelle Royale, Belle d'Orléans, Empress Eugénie, and Morello, are bearing fine crops. The frost in March thinned the Apricot blossom, but there is still an average crop on the trees, and the fruit is remarkably clean and fine. Peaches and Nectarines, on walls, have not been so fine for at least a decade, and with a fine autumn they will supply a large quantity of useful fruit. Most varieties are bearing heavily, and scarcely any old or new variety is without a crop. Strawberries suffered from the cold and dry hard wind in June, but the rain has greatly improved them lately, and they are now fully an average crop, especially our best varieties on this light soil, Garibaldi, as Viscountess Hericart de Thury is called in this district, and James Veitch. Among the newer varieties, Waterloo promises to be a good late fruit. All kinds of Currants are bearing abundantly, and so are Gooseberries and Raspberries, and have suffered very little from insects this season. At present the fruit season is nearly a fortnight late, but all the different kinds of fruit—Apples, Pears, Plums, Cherries, Peaches, Nectarines, &c.—are large and fine, clear in the skin, and from the beginning remarkably high-coloured. With a moderately good autumn to bring them to perfection, the crop promises to be the best we have had for many years. *M. Dunn, Dalkeith.*

#### ENGLAND.—NORTHERN COUNTIES.

**NORTHUMBERLAND.**—Apricots usually do well here, seldom fail to bring a crop, and are this year splendid. In spring they were protected with double fishing-net. Plums are generally scarce, but some young Victoria trees on a wall are splendid. Morello Cherries are an average crop, but May Duke, which does well here generally, has a light crop. Peaches are a fine crop. Apples are scarce, notwithstanding that the trees bloomed very well. Of Pears few kinds have a medium crop, but mostly the trees have only a sprinkling of fruits. Strawberries are very late; Viscountess H. de Thury is certainly the greatest cropper, and one of the best varieties to depend on here. *G. Harris, Alnwick Castle, Alnwick.*

—Up to the middle of July the prospects of a good crop of fruit looked very gloomy indeed. Apples, Pears, and Plums are a thin crop; some of the varieties of Strawberries are seriously infested with mildew. Our best Apples are from trees grafted on the Paradise stock, which suits our heavy soil. *D. Inglis, Howick Hall, Lesbury.*

**DURHAM.**—The crops of fruit were never later in our country. Strawberries are quite three weeks later than usual, and only a poor crop; the foliage has much overgrown the fruit, and the daily rains are doing much mischief to them. Morello Cherries are fine on pyramids, far outstripping those on walls in quantity and quality. Apples are thin and backward, and the same may be said of Pears. Small fruits are good. *J. Hunter, Lambton Gardens, Fines House.*

**YORKSHIRE.**—The fruit crop in this district is much under average, but clean and good. Peaches and Nectarines, very heavy crop; trees free from red-spider, which is not often the case in this district. Apples and Pears are partial; some trees of the following kinds are carrying heavy crops:—Apples—Keswick Codlin, Lord Suffield, Alfriston, Northern Greening, Damelow's Seedling, Tower of Glamis, Dutch Mignonette, Red Astrachan, Ecklinville Seedling or Pippin, Cellini, Mère de Ménage, Stackpools, a kitchen Apple worthy of more extensive cultivation, will keep two years and retain a brisk flavour; Duke of Devonshire, Devonshire Quarrenden, Blenheim Pippin, Annie Elizabeth, Pears,—Williams' Bon Chrétien, Beurré Diel, Souvenir du Congrès, Pitmaston Dachesse, Glou Morçeau, Uvedale's St. Germain, Josephine de Malines, Beurré d'Amanlis, Styrian, and White Doyenné. *W. Chuck, Brodsworth Hall, Doncaster.*

—As a whole, the fruit crop is bad in the north of Yorkshire. Apricots are good in many places, but in others there is a doubt whether they can ever ripen this season, as everything is quite three weeks behind the usual time. Apricots should be ripe early in August, or they never ripen at all in this neighbourhood, the nights get so long and cold. Apples are bad generally; although the bloom was extra good, the setting was bad; probably the cold, dull weather prevented the pollen from ripening. The same thing happened to Strawberries; whole bunches of bloom are quite blind. Plums are a partial crop; in some places trees are carrying a good crop, while others are without any. Pears are rather better than Apples in promise, especially the early varieties, but many of those suffered terribly by a hailstorm on June 7; the fruit was so battered that it cannot grow out of it; at the same time Gooseberries were knocked off in considerable quantities; in some cases the crop was spoiled. Peaches on a warm wall are good, and generally do well if the season is at all favourable. *William Culverwell, Thorpe Perrow, Bedale.*

**LANCASHIRE.**—Fruit crops in this district are very poor—the worst for many years; and owing to the cold and ungenial weather, the trees have not made good growth, fly and maggot being unusually numerous. Strawberries, which have hitherto always cropped well, are nearly a failure. The best this season are Viscountess H. de Thury and James Veitch. None ripe yet. *Huntroyd Park, Burnley.*

—All fruits except the Strawberry are in good form, but late. Some Apple-trees in this garden are heavily cropped whilst others have scarcely any fruit. Pears are a more even crop, and odd trees that were heavily laden last year are also so this season; but from what I can learn, the crop generally of this fruit and of Apples is very thin. We had plenty of blossom on most of the trees, and all went well until the fruit was actually setting; then came the caterpillars to devour flowers, leaves, and setting fruit. The birds, which were so attentive to fruit-tree buds not many weeks earlier, sought not a maggot as far as I could see, excepting the wagtail and a starling or two that build in the disused fue and garden wall. Morello Cherries are a heavy crop, so are bush fruits—where the birds did not interfere with the buds—except Black Currants, which are a failure. Strawberries, perhaps, were never worse. Numerous young or yearling plants, like older ones, were without a flower. Loxford Hall Seedling is better than any other variety. *W. P. Roberts, Cuerdon Hall, Preston.*

#### EASTERN COUNTIES.

**LINCOLNSHIRE.**—Two circumstances unfavourably affected the fruit trees prior to and at the period of blooming—prolonged drought and protracted cold. The blossom generally was weak and colourless, and retarded action and debility gave insects the opportunity of working mischief, and their attacks were made in multitude, Apple trees suffering seriously, and the crop is a complete failure. Although many Pear trees are unfruitful, there are some exceptions, but the general result is unsatisfactory. Cherries

are bearing well. Apricots and Peach trees are recovering from the ungenial spring, but there is a sad deficiency of fruit. There are many cases of failure in Plum trees, but there are good crops of Damsons. The dry weather of last year clearly caused the blanks in the Strawberry grounds. I do not remember so many instances of blindness in the plants. La Grosse Sucrée has suffered as little as any from this prevailing weakness. *W. Ingram, Belvoir Castle, Grantham.*

**NORFOLK.**—The season has been a most trying one for all kinds of fruit, having had frost twice this month (July), making ten months out of the twelve in which we have had frost, with a continuance of north-east wind, which has caused nearly all kinds of fruit to be scarce. Cherries and Strawberries are the best crops; Apricots are quite a failure; Peaches and Nectarines nearly so. Some sorts of Pears, such as Marie Louise, Beurré d'Amanlis, and Easter Beurré, are a good crop; other sorts are very thin. Apples are eaten with maggots and falling off; Plums very thin indeed; small fruits are a good crop, except Gooseberries, which lost a great many buds through the birds. Strawberries are very fine. Walnuts were plentiful, but many have dropped off. *H. Batchelor, Catton Park.*

**SUFFOLK.**—The spring opened full of promise as regards the fruit crop, as there appeared to be plenty of bloom; but though this was unusually late in unfolding, the weather was so unpropitious then and after that little of it set, and what did set has been sadly thinned since by late frost and cold. Apples and Pears have been much affected by maggots, which has preyed on both leaves and fruit, but the rains have now washed the trees clean. *J. Sheppard, Woolverstone Park, Ipswich.*

— Apricots are almost nil. Peaches and Nectarines with us are a good crop—the trees clean and healthy. Although the Plum crop is under average, pyramid trees of the following sorts are carrying fair crops:—Early Prolific, Rivers' Orleans, Victoria, Large Black Imperial, Sultan, Dennistons' Superb, and Farleigh Damson. Apples and Pears blossomed profusely, but the crop of fruit is much under average. The leaves of Apple trees were badly riddled by insects; recent heavy rains have washed the trees, and the growth they are now making is clean and healthy. Small fruits are plentiful and good. Strawberry plants and the fruit have suffered from mildew, and owing to the prevalence of dull cold weather the fruit is deficient in flavour. Much fruit of desert Cherries dropped at an early stage of growth; that left is small in size. Both Plums and Cherries are pretty clean; aphides and blackfly are at present conspicuous by their absence. The leafage of Filberts is full of holes, and the crop is short. *J. Wallis, Orwell Park, Ipswich.*

**ESSEX.**—A remarkable feature connected with both Apples and Pears was the abundance of bloom upon the latter, and the excellence of the blooms upon the former, which upon some sorts—Wellington's, for instance—were each as large as Dog Rose blossoms, yet these grand flowers proved less fruitful than is generally the case. Striped Beaufin, however, will shortly have to be propped up, so excessively heavy is the crop. Wellingtons come next in point of prolificacy. *W. Earley, Double House, Iford.*

— The blossoming of the trees was very late, and the weather favourable for most fruits. Apples were, of course, later than Pears, Plums, Apricots, and Cherries. The weather was fine when the Apples blossomed abundantly, and yet we have a crop much under the average. The blossoms did not set. I cannot understand why. Strawberries were much cut up by east winds, which also affected the blossoms in bud, as much of the fruit is malformed. James Veitch is the best variety this year. *J. Douglas, Great Gearys, Iford.*

— We had a great show of splendid blossom for all kinds of fruit. The trees were attacked when in bloom by caterpillars, which played sad havoc, and in some cases will probably result in the death of the trees. Cordons and other trees which have had their roots attended to have fared by far the best.

The leaves of the Apple trees are completely destroyed in some instances. *A. Ocock, Havering Park, Romford.*

#### MIDLAND COUNTIES.

**WARWICKSHIRE.**—On the whole we have this year the best all-round average crop of fruit of the last ten years, but the continued heavy rainfall is doing great damage to all small fruits. *R. Greenfield, Priory Gardens, Warwick.*

— Apricots are thin. Some years we get a good crop and fine fruit, but the Apricot generally in this neighbourhood is at best but a casual crop. The fruit, however, when they come are good. Apples had fine healthy blossoms, but are certainly disappointing. Pears on standard trees are a good crop, and with a fine autumn may prove a fairly good crop. On walls, notwithstanding the magnificent bloom, the fruit is thin. It may be interesting to remark that a fine tree of Marie Louise which was figured in the *Gardeners' Chronicle* a few years since, and which has borne excellent crops most years, is this year almost barren with the exception of a small portion, on the opposite side of which a fire burns continually. This seems to point to the fact that the old system of fued walls was not a bad idea. I wonder what they are doing now with the fued walls at Erskine—on the Clyde. I remember when there, thirty-six years ago, under the then grand old gardener, Mr. Shiels, that Grapes, Figs, and Cherries were ripened by means of walls so heated. Plums are perhaps less satisfactory than the Apples and Pears. Standards, so far as I have observed, are comparatively fruitless. There are a few on walls—but certainly not a crop. Peaches.—Of these out-of-doors I cannot very well speak, as they do not now get the attention from me they used to get; and unless the trees are well managed, and kept clean, they cannot be expected to fruit satisfactorily. Cherries have done fairly well, both on standards and also on walls. The Cherry orchard at Brandon, near here, is this year, I am told, very satisfactorily cropped. Small fruits are a plentiful crop; they only want a little dry sunny weather to finish them off. Strawberries are somewhat disappointing; last year the weather was dry, and we gathered great quantities; the same beds this year are barren throughout, yet the plants looked healthy in the extreme. One quarter should have borne well this year before being dug up. We are now busy buying and begging plants for a fresh start. The season, so far as it has gone, has been a very wet, and in many respects a very unkind one, especially for the setting, swelling, and ripening of fruit; yet it is nothing much worse than many others of the fraternity may remember, who, like me, are now placed as regards age in the front ranks of the seniors. Some say the seasons are changing; so they do, but they merely oscillate between the better and the worse—nothing more. In this we have the authority of Cowper—and no bad one either—who published "The Task" in 1784, in which we find him writing—

"England, with all thy faults, I love thee still—  
My country! And while yet a nook is left,  
Where English minds and manners may be found  
Shall be constrained to love thee. Though thy  
climate  
Be fickle, and thy year most part deformed  
With dripping rains, or withered by a frost,  
I would not yet exchange thy sullen skies,  
And fields without a flower, for warmer France  
With all her Vines, nor for Ausonia's groves  
Of golden fruitage, and her Myrtle bowers."

I admit that, this year, the lowest temperature has been chronicled; and, although we have had much cloud and much rain, I can easily remember in the June and July of other wet seasons, having far greater frosts, *i.e.*, speaking of this neighbourhood; so that, comparing these deformed seasons with the deformed ones alluded to by Cowper over a hundred years ago, we may come to the conclusion that we have not altered much, either for the better or for the worse. One more quotation, and I have done. This is from Shakespeare, who

wrote towards the end of the sixteenth century, and was more severe on the weather than even Cowper (*Midsummer Night's Dream*, act i., sc. ii.) :—

"And through this distemperature we see  
The seasons alter; hoary-headed frosts  
Fall in the fresh lap of the crimson Rose;  
And on old Hyem's chin, and icy crown,  
An odorous chaplet of sweet summer buds  
Is, as in mockery, set. The spring, the summer,  
The chilling autumn, angry winter, change  
Their wonted liveries; and the mazed world,  
By their increase, now knows not which is which."

*William Miller, Combe Abbey Gardens, July 23.*

**NORTHAMPTONSHIRE.**—The Apple crop here is a very good one. Some varieties, such as Lord Suffield, Bridgewater Pippin—a variety little known in the South and a first-class Apple—Blenheim Orange, Hanwell Souring, are amongst the best. The heavy rains are spoiling what Strawberries we have. All bush fruits are very abundant. *G. H. Goldsmith, Floore House, Weedon.*

— All Apple and Pear trees suffered very much from caterpillar; some trees in the orchard were stripped of all their leaves in June. Of Strawberries, Sir J. Paxton and Sir C. Napier never bloomed; J. Veitch and President were good. Bush fruit generally is abundant. *E. Cole, Althorp Park, Northampton.*

**BENDS.**—The present season is about the worst I remember for most kinds of fruit. No doubt much of the blame may attach to the extraordinary dryness of the past season. Although the trees were loaded with blossom there was a very small percentage of the blossoms set; and immediately after the Apples blossomed we were visited with a perfect plague of caterpillars, which denuded the trees of foliage in a week's time. Strawberries require sun badly, as the fruit is very insipid. *W. M. Bailie, Luton Hoo Park, Luton.*

**OXFORDSHIRE.**—Apricots and Plums are irregular; the buds of the latter were much injured by birds in early spring. Cherries are generally good. Peaches and Nectarines are rather thin, and the leaves blistered a good deal. Apples are very poor, especially orchard trees; dwarfs on the Paradise stock are fairly good; the trees have not been injured by caterpillars in this immediate neighbourhood. Pears good on walls, but thin on open trees. Small fruits of all kinds are most abundant. Strawberries good, but much injured by the heavy and constant rains. Nuts scarce. Walnuts somewhat irregular, small and late. *G. Stanton, Park Place Gardens, Henley-on-Thames.*

**BUCKS.**—Notwithstanding a prolonged period of cold and sunless weather that prevailed in the spring, the fruit crops, taken collectively, are looking satisfactory in this district. Apples and Plums are a partial crop. Pears and Cherries generally good, and Apricots promises to be so. Peaches and Nectarines are not so abundant as last year. Bush fruits clean and good but late. Strawberries less abundant than last year, and nuts likewise. *G. T. Miles, Wycombe Abbey, High Wycombe.*

— Apples and Pears are a poor crop. Plums, such as Green Gage and Victoria, and Damsons a very heavy crop; the trees are healthy and the fruit swelling up well. Strawberries are much in want of dry warm weather. Walnuts and Peaches are a very good crop. *J. Smith, Mentmore, Leighton Buzzard.*

— Speaking generally, the fruit crops of this district are considerably under the average, the cold and dry spring being the chief cause of this. Peaches and Nectarines suffered from the severe frosts and easterly winds, and are carrying, in consequence very little fruit; the trees, however, are now looking well, having benefited much from the copious rains of the past few weeks. Apple trees were infested with caterpillar, but I notice that here and there a tree has escaped, and is bearing a fair crop. Bush fruits and Strawberries are plentiful, but want sun to ripen them. *C. Herwin, Drymore, Maidenhead.*

**HERTS.**—Apricots blossomed weakly, and were imperfect in the bloom, owing, no doubt, to last year's drought. Peaches are a good average, thanks to a copious supply of water while the fruit was swelling-off last year. Apples are very erratic.

Ribston, Irish Peach, Sturmer Pippin, Brownlow's Russet, Beaufin, Dutch Codlin, Majetin and Fearn's Pippin are weighed down with fruit, while a great number of other varieties are bearing very thinly, or even not at all. The same may be said of Pears, but on the whole the Pear crop will be much lighter than the Apple crop. We were troubled with the

but were destroyed by the caterpillars. I never remember having seen such devastation in such a short time. Oaks in the park suffered in the same way, some trees being entirely denuded. Peaches and Nectarines are heavily cropped. Pears and Plums very fair crops and good on walls, but thin on espaliers, bush, and pyramid trees. Strawberries,

LEICESTERSHIRE.—Some kinds of Strawberries here are very good. Keen's Seedling, Pauline, MacMahon and Prince of Teck have failed to produce flowers. *J. Hanshere, Beaumanor Park, Loughborough.*

RUTLANDSHIRE.—Apple trees in this neighbourhood are very healthy, nearly free from maggots; but many sorts are fruitless. Small's Admirable, Northern Greening, Lord Suffield, Tower of Glamis, Hawthornden, and Worcester Pearmain are carrying good crops. A lot of young trees, lifted and root-pruned two years ago next autumn, are most satisfactory. Peaches are under average; the trees suffered much from blister in the spring. Apricots bear a light crop, but they are wonderfully clean and healthy. Pears, a failure, except Bergamot d'Esperen, Marie, Louise, Beurré Hardy, Winter Nelis, &c. Small fruits are very good. Strawberries, such as Keen's Seedling, Vicomtesse H. de Thury, Sir Charles Napier, Loxford Hall Seedling, and Elton, were also a fair average crop. The last-named variety I found to be a free-bearing, useful sort. The aphid family appears to be extinct this year, as there are none on the Cherry or other trees so far. *J. Grey, Normanton Park, Stamford.*

#### WESTERN COUNTIES.

GLOUCESTERSHIRE.—Bush fruits are good this year, but not so plentiful as last, being on the limestone, and the drought during the growing season last year caused the trees to make little growth, especially the Raspberries, the strongest canes being only 3 feet in height. Apple trees have suffered with the maggot, but Pear trees look well—there will be very little thinning to do. *A. Chapman, Weston Bird Gardens, Gloucester.*

MONMOUTHSHIRE.—Fruit trees here were generally unusually floriferous this year, and the blossoms escaped damaging frosts, yet, in many instances, the crops are disappointing, particularly Apples, which are partial, and considerably under average. The varieties that blossomed earliest and latest carry most fruit, while the foliage of all kinds has been greatly injured by caterpillar. Pears set their fruit satisfactorily, and are swelling well. Upon walls Beurré d'Anjou, Beurré Diel, Brockworth Park, Flemish Beauty, Jargonelle, Louise Bonne of Jersey, Marie Louise, Ne Plus Meuris, Pitmaston Duchesse and Williams' Bon Chrétien carry the heaviest crops; Beurré Diel and Beurré d'Amanlis being excellent as standards. Amongst several kinds of Apricots upon a west wall, Peach and Shipley's have the best crops. Plum trees were attacked by aphids early in the season, but are now clean and healthy, and although generally thinly cropped, Kirke's and Victoria are fairly good. Upon our heavy and deeply worked soil Strawberry plants did not greatly suffer from last year's drought, and they are very fruitful; but owing to rain and want of sunshine the fruit lacks in colour and flavour. Respecting quality the same may be said of Cherries, and Morellos have cast a portion of their crop. Currants, both black and red, together with Gooseberries and Raspberries, are abundant, although the latter did not last year make the robust growth they usually do. All fruits are late in ripening. *T. Coomber, The Hendre.*

HEREFORD.—The fruit crops here are, with the exception of Peaches, Nectarines, and Plums, very satisfactory. Peach and Nectarine trees were full of bloom, but the long-continued low temperature, accompanied with bitter cold winds, prevented them, and also the Plums, from setting a good crop. Apricots bloomed much earlier in the season, and set well, and all the trees are carrying good crops. Cherries are also carrying very heavy crops, and Morellos and Kentish promise to be unusually fine. Apple and Pear trees bloomed most profusely, but caterpillars caused great destruction by eating the flowers, young fruits, and foliage. But in spite of these drawbacks some trees are carrying excellent crops, and altogether we shall have nothing to complain about. Bush fruits are abundant, and of good quality. Respecting Strawberries, I have never

FIG. 13.—HEUCHERA SANGUINEA: HARDY PERENNIAL: FLOWERS BRIGHT CRIMSON. (SEE P. 122.)

maggot, but are free from the caterpillar, so prevalent in some places. The severe storm which passed over this district on June 26 cleared us from all insect pests, and trees now are clean and healthy. Strawberries with us are a heavy crop of fine fruit, but quantities are rotting on the ground through continued rains. *J. Kipling, Knebworth Park, Knebworth.*

—Apricots good, where the blossom was protected from the cold winds, driving snow, and rain. Apples promised well; good crops set on all trees,

Currants, Gooseberries, Raspberries, heavily cropped and fine. Cherries good on walls. Strawberries are a little acid and watery, owing to so much rain and little sun. There are splendid crops yet to ripen. I am only speaking of the earliest gatherings. Since June 19, 5.50 inches of rain have fallen at Moor Park. Vegetables look well, and have made considerable progress lately. We are quite a fortnight late in all outside produce. *J. Mundell, Moor Park Gardens, Rickmansworth.*

known them to bloom better than they did this season, and the plants are now carrying heavy crops of fine fruit of first-class quality. *A. Ward, Stoke Edith Park, Hereford.*

— Apples are a very disappointing crop after the fine show of bloom we had in the spring. Some orchards have hardly a leaf on the trees owing to the ravages of the caterpillar. I have heard there are a few exceptions where they have a good crop. *C. Denning, Holme Lacy.*

— The fruit crops in this locality are partial and irregular, but on the whole better than many growers at one time anticipated. I see from spring frosts we must go back to the past year of heat and drought for the cause of failures or partial blindness amongst Strawberries and some fruit trees which were too weak to form and mature their flower-buds. Apples, on the other hand, set an abundance of perfect flower-buds, also in due course plenty of fruit, but the unprecedented attack of grub has greatly reduced the crop, and in some orchards completely defoliated the trees. In this garden we have been obliged to thin Apples and Pears, whilst Blenheim Orange and some other varieties of Apples in orchards are bearing heavier crops than usual. Plums have failed through lack of blossom. Apricots, I believe, are far from plentiful. Peaches and Nectarines have required much thinning, also more attention than I have given to them for some years past. Green-fly, fostered by slow growth, has been most persistent, but soap-suds has been our only insecticide and the trees are now clean and quite to my mind. Gooseberries and Currants, netted from bullfinches in the spring, are an enormous crop, clean and fine. Strawberries are an irregular crop, and the fruit, owing to the absence of rain combined with unseasonable cold, is much affected by mildew. With the exception of a few sorts of Apples and Pears, and choice Plums, which are quite a failure, our fruit crops are above the average. The fine rains have wrought a marvellous improvement, but unless we have a great rise of temperature, and that quickly, the crops will be late and deficient in flavour. *W. Coleman, Eastnor Castle Gardens, Ledbury.*

WORCESTERSHIRE.—Taken all round we have an excellent crop of fruit, with the exception of Plums, which were very thinly flowered. Apples are a very heavy crop—more than we have had for many years, and the same may be said of Pears, both on walls and standards, and they promise to be highly coloured; Marie Louise, Glou Moreau, Passe Colmar, Beurré Rance, Madame Treve, Easter Beurré, Josephine de Malines, and Pitmaston Duchess are heavily laden. Strawberries are an immense crop, and very fine, Sir J. Paxton and Sir C. Napier being the best, although the first named has been on the same quarter for five seasons. All bush fruits are a heavy crop, notably Black Currants, Raspberries, and Gooseberries, the latter exceptionally so. Both Nuts and Walnuts are very good. *W. Child, Croome Court, Severn Stoke.*

— The Apple crop was much reduced by the depredations of caterpillars, and where trees escaped their visitations very heavy crops may be seen, notably Blenheim Pippin, Lord Suffield, King of Pippins, Ecklinville, Keswick Codlin, Pomona, Cellini, Stirling Castle, and a local kind known in Worcestershire as Malster. Pears are a better crop, even better on pyramids and standards than on walls, but they and Plums suffered from insects—the latter from aphid; still, there are fair average crops to be seen. Apricots are clean, and an excellent crop. Peaches and Nectarines are much damaged by persistent attacks of aphid. Cherries plentiful and good, as are also bush fruits. Strawberries a failure, only young plants bearing satisfactorily. *W. Crump, Madresfield Court, Malvern.*

— Apples and Pears are much under the average, and both have suffered to a very great extent from the depredations of the caterpillar and maggot, the former denuding the trees of the foliage, and the latter damaging the fruit. Peaches and Nectarines bloomed well and set good crops of fruit; but owing to the prolonged drought and cold east winds follow-

ing the blooming period, and the subsequent dull wet weather, the crops are in a very backward state; however, notwithstanding these drawbacks the trees and foliage are in a clean and healthy condition. Apricots generally are good, the produce promising to be fine, trees healthy, clean, and vigorous. Both Plums and Cherries are much under the average; the fruit and foliage of the latter also suffered from the attacks of caterpillar in the earlier stages; and now, owing to continuous rain and sunless weather, the already meagre crops are rendered almost useless and unsaleable by cracking and rotting. Strawberries and all small fruits are abundant and fine; the former, however, up to present date, almost useless from want of sun and drier weather. *J. Austen, Willey Court, Stourport.*

SHROPSHIRE.—Apples partial, and slightly under average; some sorts are good crops, others entire failures. Here Codlins, Golden Winter Pearmain, Tower of Glamis, Ribston Pippin, Grosse Sucrée, Hawthornden, and Red Astrachan, are our best examples. Pears are average, and doubtless will "swell off" well after the recent copious rains. Wall fruit scarce, although some trees are carrying full crops. Cherries good crops, especially Morellos. *A. Kemp, Broadway Gardens, Shifnal.*

— Apples in this district are very partial, only the varieties Hawthornden, Lord Suffield, Ribston and Orange Pippins, and Stirling Castle, are bearing good crops, and all trees have been sadly affected by caterpillars. Pears are also under average, with the exceptions of Beurré Del, Williams' Bon Chrétien, Jargonelle, Winter Nels, Josephine de Malines, and Glou Moreau, which are carrying heavy crops. Strawberries are exceptionally good this year, the copious rains having just come in time to swell them off. Peaches and Nectarines were badly affected by blight. *R. Milner, Sundorne Castle, Shrewsbury.*

CHESHIRE.—Apricots are a fair average, but only a few trees are grown. Plums a very poor crop. Peaches and Nectarines fair, but they were very much troubled with blight in the early stage of growth. Pears a fair average crop. Marie Louise being a thinner crop than usual. Winter Nels, Ne Plus Meuris, Beurré Royale, Napoleon, Autumn Bergamot, Louise Bonne of Jersey, and a few others are carrying full crops. Apples are average. Keswick Codlin, Lord Suffield, Pott's Seedling, Ribston Pippin, Hawthornden, Margil, Mère de Ménage, John Apple, and Irish Peach are full; other kinds thin. Strawberries about half a crop. *J. Atkins, Tatton Gardens, Knutsford.*

— Pears may be said to be about average, as some kinds are full in crop, though others have very few. The same remark applies to the Apples. Amongst Pears Williams' Bon Chrétien, Louise Bonne of Jersey, and Jargonelle have good crops; and of Apples Grenadier, Lord Grosvenor, Pott's Seedlings, Ribstons, and King of the Pippins are bearing freely, and at this early date are looking very well. Victoria Plums and Damsons are good crops. Morello Cherries and Late Dukes are looking fair, so are Currants and Raspberries, but Strawberries are a failure—the worst crop that has been here for many years, which we attribute to the excessively dry summer last year. *R. Muckellar, Abney Hall, Cheshire.*

#### SOUTHERN COUNTIES.

MIDDLESEX.—In this market-garden district, where Apples form such an important crop, it is unpleasant to have to report that not only are they under average, but very much so. Since the original setting large quantities of fruit have fallen, either because of defective fertilisation or else that the excessive rainfall has promoted an unwonted ascent of sap, which pushed off all the weaker fruits. What are left, however, will be fine and clean. Pears are very good indeed, although ordinary market sorts are of no special value. Plums generally, Victorias in particular, and Damsons, are abundant; so also are sweet Cherries and Morellos, both being unwonted good crops. Gooseberries have been but a moderate crop, but

clean and good, whilst both red and black Currants are very fine and plentiful. So also are Raspberries. Strawberries were only a fair crop at starting, and suffered severely from excessive rain, so that on the whole it has proved a light produce. *A. Dean, Bedford.*

SURREY.—The prospect for a fruitful year never looked more promising, every tree having abundance of bloom, most of which were fine and fully developed, and the set was a very good one. Then the trees were attacked by the caterpillar, which almost denuded them of their foliage and fruit, and what little of the latter is left is so gnawed that there will be but few clear specimens left. The above remarks apply to Apples more especially, but Pears suffered in nearly as bad a degree. Strawberries are abundant and fine but lacking in flavour owing to the low temperature and continuous rain. Raspberries, Gooseberries, and Currants are plentiful and fine, free from Caterpillars. Peaches and Nectarines set a fine lot of fruit, but owing to the blister and sunless season, I am afraid they will not ripen. A great many fruits were damaged by the heavy hailstorms on June 18, which quite riddled everything and washed even pyramids of Pears, 8 feet high, out of the ground. I registered 1½ inch of rain and hail in fifty minutes. Pears and other fruit lay under the trees quite thick. *A. Evans, Lythe Hill, Haslemere.*

— Our fruit crops are very satisfactory with the exception of Peaches and Nectarines. There are, however, round here many orchards, which have lost nearly all their leaves and fruit from caterpillars, and the Apple crop generally will be very short, though there are a few favoured spots where there are good average crops. Strawberries are very good in crop and quality. *J. Burnett, The Deepdene, Dorking.*

KENT.—I am right in the fruit growing district, and round here Plums are plentiful, and promise to be good in quality. Apples and Pears are thin, owing to maggot, which, however, since the recent rains have quite disappeared. Cherries are good, especially Morellos. Bush fruit, on the whole, are good, particularly Gooseberries and Raspberries, which are abundant and large. Strawberry crops poor, lacking colour and flavour, mildew having made its appearance in Sir J. Paxton—a kind much grown for market—but Myatt's Eleanor and Elton Pine promise to be good. *F. Moore, Blendon Hall, Boxley.*

— The fruit prospect in this neighbourhood is anything but cheerful. A dry season like that of 1887 soon makes even comparatively young plantations unprofitable, and last year did more than previous years to destroy them, consequently the acreage was smaller this year—less than usual—hence the good prices realised; the continual wet weather has rotted large quantities in low-lying fields. Raspberries promise to be the most abundant crop known for years. *H. Cannell, Swanley, Kent.*

— The fruit crop is not quite satisfactory. Small fruits of all kinds are plentiful and good, but the Apple crop will be deficient. It would be well to mention those kinds which are a full crop, and the following are those in the gardens here:—King of the Pippins, Cockle Pippin, Mère de Ménage, Norfolk Beefing, Winter Hawthornden, New Hawthornden, Betty Gesson, Sturmer Pippin, Lady Henniker, Fairy Apple, Hanwell Souring, Adam's Pearmain, Hughes' Golden Pippin, Striped Beefing, Wellington, Duke of Devonshire, Mannington Pearmain, Gravenstein, Queen Caroline, White Paradise, Lane's Prince Albert, Kerry Pippin, and Winter Queening. The trees did not bloom till the month of May, and one would have imagined that we should have had a good crop, but the weather was cold, dull and unfavourable, and the extraordinary crop of last year left us but few fruit-buds, and those weak—another instance of want of judicious thinning and the shortness of labour in all our gardens. *J. Rust, Eridge Castle, Tambridge Wells.*

SUSSEX.—The fruit crops in the surrounding districts are very variable. The most important crop—Apples—is, generally speaking, a failure; our own

is almost as bad as Mr. Fish described recently in the *Gardeners' Chronicle*. Pears are moderate in quantity, and clean and promising. Peaches with us are a failure, while at Normanhurst and Battle Abbey, neighbouring gardens, they are abundant; at those two places Peaches are most successfully cultivated. Strawberries here are excellent, especially Vicomtesse H. de Thury and Burghley President. Bush fruits are plentiful. We are very free from fly, and were it not for the failure of the Apple crop we should have no cause to complain. *W. R. Holmes, Ashburnham Place, Battle.*

— Apples are under average; after a great deal of blossom on some sorts scarcely a fruit is to be seen; others, again, such as Keswick Codlin, Lord Suffield, Adam's Pearmain, Lady Henniker, Flower of Kent, and Dr. Hogg, have very fair crops. Pears are a fair average crop, and the fruit is very clean; trees are blighted. Plums scarce, but we have an average crop of Victoria, Pond's Seedling, Orleans, Reine Claude de Bavay, and Kirke's Blue. Cherries a good crop all round the district. Strawberries are abundant, and very fine, as also are all kinds of small fruits in the district. *S. Ford, Leonardslee, Horsham.*

HANTS.—The worst season I have ever known. The foliage of Apple trees, and in some cases the young wood, have been quite eaten up by caterpillars. Many Pear trees have shared the same fate, and all have suffered more or less. The singular part of the affair is, that other fruits have escaped with but little injury, the caterpillars preferring the leaves of the Oak, and scores of the trees in the park are at the present time as leafless as at Christmas. Apricots were not injured by the caterpillars, the failure of this crop being, I think, attributable to the drought of last summer, as the buds dropped as soon as the swelling stage was reached. I am confirmed in this opinion by the fact that two or three trees that were convenient to the water, and therefore not good supplies, are fruiting moderately well. Altogether this is the worst fruit season that has ever been known in this part of the country. *W. Wilsmith, Heckfield Place Gardens, Winchester.*

HAMPSHIRE.—Strawberries have been a heavy loss to growers in the neighbourhood generally, as many as 20 tons less being sent away from one station in a single day than in some years, owing to continued rains, the fruit rotting on the ground. Apples did not flower so freely as last year. Long-continued cold weather prevented a free set. Some few sorts, such as Mère de Ménage, King of Pippins, Warner's King, Golden Pippin, and Irish Peach, have heavy crops, others almost nil. Very few varieties of Pears have any—Marie Louise, Jargonelle, Beurré Diel, and Pitmaston Duchess, on walls, are the only ones with a good sprinkling of fruit. Pyramids of Beurré Diel, Doyenné du Comice, Williams' Bon Chrétien, and Louise Bonne de Jersey, have heavy crops. Bush fruits are exceptionally heavy, and of good quality, Gooseberries and Currants in particular. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

BEKES.—Apple trees were very much eaten up, and the few old trees that did blossom were eaten up by caterpillars. Young trees carry a good crop. Strawberries destroyed by incessant rains. Currants going mouldy. Gooseberries are the heaviest crop within my recollection. *N. Sinclair, Easthamstead Park, Wokingham.*

— Peaches showed abundance of flower, but owing to east winds and sunless weather, had no chance to set. Of Apples a great many sorts did not show any bloom; this I put down to the dry season of 1887. Blenheim Orange, Lord Suffield, Alfriston, Beauty of Hants, and King Pippin, are about the best we have. We have suffered considerably from the caterpillar both on fruit and forest trees. *J. H. Rose, Lockinge Gardens, Wantage.*

— Our fruit trees on the whole are looking very well, what we now want is sunshine and warmth after comfortless and boisterous winds, and a temperature sometimes down to 38° at night; such continued low temperature, I should say, is without precedent.

This is all against the fruit crops. Raspberries are very good and abundant. From what I have seen I should say fruit crops in this locality are a good average. *T. Jones, Frogmore, Windsor.*

— The fruit crops in this neighbourhood very much. Here very good crops all round, but our best crops are Peaches and Nectarines, Plums, Apples, and Pears. All small fruits are good crops; Strawberries very fine, but much spoilt with the heavy rains. In some gardens a short distance from here the Apple crop is a complete failure. *J. Tegg, Bearwood, Wokingham.*

WILTS.—The prospect of an all-round good year of hardy fruit was very promising before the respective kinds burst into flower, but the long spell of cold easterly winds and leaden sky, accompanied by frosts at night, which prevailed during the time the trees were in flower, caused a large percentage of the blossoms not to set, not so much by reason of the frosts—as all the choice kinds were covered with canvas blinds at night—as on account of the uniformly low temperature which we had all the time the flowers were open. However, taking all the crops together, we have not much cause for complaint. The following are bearing good average crops:—Peaches: Barrington, Alexandra, Noblesse, Chancellor, Sea Eagle, Dr. Hogg, Bellegarde, Violette Hâtive, Nectarines: Pine-apple, Lord Napier, Elruge, and Balgown. Plums: Green Gage, Early Favourite, very heavy crop; Early Prolific, heavy crop; Victoria, Pond's Seedling, Kirke's, Mitchelson's, Orleans, heavy crop; Guthrie's Apricot, Reine Claude de Bavay, Coe's Golden Drop, Royal Hâtive, Mirabelle Jaune, a small round golden Plum; and Prince Engelbert. Pears: Marie Louise, Passe Colmar, heavy crop; Josephine de Malines, Williams' Bon Chrétien, Louise Bonne de Jersey, Easter Beurré, Althorp Crassane, Jargonelle, Dunmore, Beurré Grise, Uvedale's St. Germain, and Catillac. Cherries: May Duke, Black Tartarian, Bigarreau, Cleveland, Imperatrice Eugénie, and Morellos, very heavy crops of large clean fruits. The Apple crop is poor. *H. W. Ward, Longford Castle, Salisbury.*

#### SOUTH-WESTERN COUNTIES.

SOMERSET.—In this district trees much exposed are carrying very poor crops of fruit, this being partly due to cold easterly winds, and partly to a great plague of insect pests. Sheltered trees are much healthier, and the crops are heavy, clean, and, with the exception of Apples, generally well formed. Everything is very late. Bush or small fruits are so heavily laden as to quite break down the branches. The first Strawberries rotted on the ground, but later fruits were of good size and fairly good in quality. What is really wanted is plenty of sunshine. *W. Iggulden, Marston House.*

DEVON.—Many of the fruit trees on walls, especially Peaches, Nectarines, and Apricots, are not so good as usual, owing no doubt to the effects of spring drought. Many were dry at the root during the flowering period; hence the fruit failed to set. Aphids has been very troublesome this season, and this pest got over, mildew set in, Peaches and Nectarines requiring dustings of sulphur occasionally. Plums on walls are excellent, so also are Pears and Morello Cherries. Generally the orchards have poor crops of Apples, but here all are pyramids, and we have very good crops. Bush fruits are fine and excellent. Strawberries were very good indeed. Where allowed to grow together in beds the fruit rotted much during the wet weather, not so where kept grown singly. *D. C. Powell, Powderham.*

— Apples set badly and late, and some sorts better than others, notably: Quarrenden, Cellini, Emperor Alexander, Dumelow's Seedling, and a few others which have good crops. Peaches and Nectarines are poor hereabout, and are going out of cultivation out-of-doors; leaves were very much blistered, and the fruits became spotted and fell prematurely. Pear trees are healthy and fair crops on the usually free-setting kinds; many trees no fruit whatever on. I never saw Strawberries so fine as this year, or the crop heavier. Very few spoilt

with rain. Gooseberries and Currants are also fine, and good crops. *G. Baker, Menblam, Plympton.*

CORNWALL.—Owing to spring frosts and a disastrous hailstorm on June 13, the fruit crops in this neighbourhood are anything but good. With the exception of small fruits and Cherries, it is much under the average. Apples and Pears were so abundant last season that the trees were too much reduced to show bloom. The Pears and Plums that did blossom well were sadly cut with frost. The week's summer weather we enjoyed at the end of May was at the exact time to set the Nuts, consequently we have a fair crop, and the Beech boughs are bending beneath their weight. *C. Lee, Boconnoc, Lostwithiel.*

#### WALES.

DENBIGHSHIRE.—The growth of all trees has been sparingly made; doubtless we shall have a stronger autumn growth on account of the late heavy rains. Most fruit trees bloomed profusely. Apples, Apricots, Cherries, and Quinces set well. Pears, Peaches, Nectarines, Plums, and Damsons set very indifferently, consequently thin crops. Gooseberries and Currants are heavily laden. Raspberries prolific, but small, and weak stem. Strawberries generally set weakly, and flowered thinly—Vicomtesse H. de Thury, Sir Harry, Black Prince, King of Earlies, Elton Pine, good crops; about ten other varieties are worthless, including President. The persistent dry cold of the winter and spring, succeeding a dry summer, acted detrimentally on many of the fruit trees. *P. Middleton, Wymstey Gardens, Raabon.*

PENBROKESHIRE.—Apples bloomed well, but late this season, and the weather being dry and fine at the time, there was a remarkably good set. Pears also bloomed very well, every tree being profusely covered with strong healthy bloom. The early blooming varieties set the best, as they had dry weather. Marie Louise and a few other varieties which flower at the same time are almost a failure, the weather being wet and stormy during the time that they were in flower. *G. Griffin, Slebeck Park, Haverfordwest.*

#### IRELAND.

KILKENNY.—The fruit crop on the whole is a good average. During the flowering period there was an abundance of blossom on nearly all sorts of trees, but amongst Apples, Pears, and Plums only the free bearing varieties are carrying a heavy crop. Small fruits in general are abundant. *W. Gray, Woodstock, Instige.*

#### CHANNEL ISLANDS.

SCILLY.—So small a quantity of fruit is grown at Scilly that reports are not of much value. The Apple crop promised well with an abundance of bloom, but cold winds prevented their setting. Plums also promised well, but they suffered even worse than the Apple crop. Hawthorn and Worcester Pearmain are the best set Apples. *G. D. Vallance, Tresco Abbey.*

JERSEY.—Stone fruits, especially Peaches and Nectarines, suffering very severely, owing to the continuous late frosts. Plums are a partial crop, trees in exposed situations having shed all their blossoms. Morello Cherries stoned well, but the continuous heavy showers of rain cause them to shed their fruit, the ordinary means of protection being insufficient to meet the contingencies. Apples and Pears are below the average. Small fruits are a good average crop. Strawberries and Gooseberries being abundant. Raspberries and Blackberries promise well. *W. B. Saunders, St. Saviours.*

THE OXFORD CARNATION AND PICOTEE UNION.—It is found that the flowers are so late in the Northern and Midland Counties this season, that Mr. Dowdell has postponed the annual exhibition in his garden in the Stanley Road, Oxford, from August 7 until August 14. The usual luncheon will follow the exhibition; and the business meeting will take place in the evening.

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 91.)

**HISTORICAL SUMMARY.**—Whatever may be said in favour of the different "methods" adopted in different text-books as a help to "learning chemistry" for professional or technical purposes, the historic method has this advantage for the student of plant life, that it at once brings him in contact with the earliest investigations of compounds of  $\text{CHON}$  (Carbon, Hydrogen, Oxygen, Nitrogen). From these investigations all our modern chemistry has a direct descent, the explanations of phenomena having come in more or less clearly from electricians and physicists, till perhaps the earlier workers would not fully recognise their science. From  $\text{CHON}$  the greater part of the physical basis of plant structure is built up, and it is to certain compounds of these on which anyone who studies plant life has mainly to fix his attention.

The study of "ash" or that which remains after the combustion of a plant, and methods of analysis bring him in contact with other elements and their compounds, but still with the greater part of the knowledge set forth in handbooks of the science, he has no directly practical interest. Nor need he fear that he will fail to understand how we have come to know what we know if he does not carry his historic retrospect further back than the middle of the last century. It is true that some have claimed both for Boyle (b. 1627), and for Hales (b. 1677), a high place as pioneers in chemistry. That may arise from modern interpretations put on their writings. It at least is difficult to trace any direct continuity of the influence of their researches on their successors.

### BLACK'S WORK—CARBONIC ACID.

Two important changes in chemical work which signify characterised the early part of the second half of the last century, were the re-introduction of the balance, and the commencement of the study of gases. Till then air was to chemists simply air, and the few gases (as we now call them) that had been examined were regarded as "tainted air." There is no trace that any one even used the word *airs*\* in the plural till Black did, and from the days of Alhazen (A.D. 1100) the balance seems to have been entirely neglected by chemists till Black again used it.

The old Greeks fond of, and ingenious at, guessing at the origin of things, had in turn held that earth, water, air, and fire, were the "elements" from which things sprung, and these had continued to be regarded as elements.

The mediæval chemists had principally paid attention to the qualities of bodies, their action on one another, and as drugs. Quantity they disregarded, and hence could never have arrived at a notion of the proportions in which bodies influence one another.

Prior to Black's time, the explanation of combustion (put forward by Beecher and Stahl about sixty years previously) was that, when a body burned, there was something that passed out of it into the air. This hypothetical something was named *phlogiston* ( $\phi\lambda\omicron\gamma\iota\sigma\tau\omicron\nu$ —burnt), and "the phlogiston theory" was believed in by everybody—by what is called "all the world," and, I suppose, "his wife" too. We know that some years later one wife—Madame Lavoisier—after her husband had "abjured the heresy," took prominent part as a widow in the ceremony of burning the "wicked books."

Black's discovery was a simple one, but a memorable one. His experiment is worth while repeating by those who have not yet done so. Most people know that burnt lime is caustic. Those who do not know this can get the information from any bricklayer. Black† when about twenty years of

age (1752) was examining the difference between mild lime and caustic lime. It occurred to him to try whether the phlogiston supposed to give it its causticity when it enters into it from the burning fire made it much heavier. He weighed a lump, burnt it, and then weighed it again. Instead of being heavier it was lighter. He left the lump on the balance, apparently attending to something else when he had noted the weight. Some time after, going to his balance again he found the lump nearly its original weight. This set him thinking. Evidently in burning, something had gone out of it into the air, and the regain of the weight was due to something that came in from the air. He then poured acid on limestone. Again he found something went out, for even with the additional weight of the acid, his lump became lighter, and again, on standing, the weight in time was regained, showing something came in from the air. As his attention was directed mainly to the cause of the causticity of lime, and he was at Edinburgh preparing for his M.D., he did not at the time push his enquiries further concerning this "air" than to identify it with the air we breathe out. It for many years was known by the name "fixed air." Although chemists now call it carbon dioxide, it still retains in popular language its more familiar name, carbonic acid. The fact of its composition being

and the adoption of the symbol  $\text{CO}_2$  was of course not till after Dalton's law of multiple proportions was established. We owe to Lavoisier the first explanation of its composition.

The important part it plays in relation to plant life was not understood till later still.\*

### CAVENDISH—HYDROGEN, &c.

Cavendish, who at the age of twenty-two had left Cambridge shortly before Black's dissertation was published, took up among other subjects an examination of the "fixed air" with a view to determine its density as compared with ordinary air. His rigid rule in all his work was to measure, weigh, and calculate. His habits of exactness and method extended to his own daily life, of which some amusing accounts are given in his memoirs by Dr. Wilson.† In 1760 he joined the Royal Society, and in 1766 contributed his first three papers under the title "Experiments on Factitious Airs." They were printed in the *Transactions of the Society* for that year, vol. lvi., p. 141.

The plate given to illustrate what he terms his "contrivance"—for he does not use the more dignified word apparatus—is well worth looking at, it is so charmingly primitive and simple.‡ The pneumatic

\* It is difficult to determine how far Boyle or Hales understood it. † Cavendish Society's publications.

‡ The kind of way in which Cavendish worked can be readily understood by an experiment with a homely apparatus. Take a glass jar or pickle jar. Pour in half a pint of water and make a mark (say a file scratch) where the water stands. Pour in another half pint and mark that, then another and another. Put the jar into a tub of water deep enough to fill the jar, then holding it, mouth downwards, gradually raise it till it is nearly out of the water. It can be easily supported in this position on the edges of two bricks. Blow through a tube with its end held close under the mouth, and as the bubbles rise the water in the jar will be gradually displaced. In this way you can collect a half pint, pint, &c., of the carbonic acid you have breathed out. A little more trouble will illustrate the method of collecting gases generated from different sources. Take another jar with a well-titting cork, into the cork insert a bent tube long enough to reach over the tub to the mouth of the jar in the water. Put some effervescent powder and water in the jar, put in the cork and place the end of the tube under the mouth of the inverted jar. You will be able (roughly) to measure the amount of gas given off from the effervescent mixture.

This will illustrate the meaning of the expression "gases collected over water." As some gases are very soluble in water (such as ammonia) it is not possible to collect them over water. In this way a certain volume (say half a pint) of one gas can be mixed with double that volume of another by letting in first the one and then the other. This Cavendish did with hydrogen and air, and afterwards with hydrogen and oxygen, and "exploded" the mixture by applying a light. In delicate researches accurately graduated tubes are used instead of the roughly scratched pickle jars, but the method is practically the same.

trough with its convenient shelf had not been invented. That is believed to have been Priestley's device. The phials that were to collect his "airs" were, after Hales's fashion, hung mouth downwards in water by strings. What would a student accustomed to a well-equipped laboratory think of such "contrivances"? Yet he gives a most exact description to even the "luting" of the stoppers, and the joinings of the glass tubing. The three papers were on:—

1. The specific gravity of inflammable air from five different sources (now called hydrogen). His result was that it is but one-eleventh of common air. He noted that inflammable air cannot burn without the aid of common air.

2. The specific gravity of fixed air (now commonly called carbonic acid). His result was that it exceeds that of common air by one-half.

3. On the air produced by fermentation. Engaged with other work, Cavendish did not communicate any other chemical paper till 1784.

### RUTHERFORD—NITROGEN.

Meanwhile, Rutherford, in 1772, made known the existence of another distinct kind of air in the atmosphere. Mice could not breathe in it: hence the inference that it had nothing to do with supporting life like "common air." It would not support combustion. Though fixed air also would neither support life nor combustion, this air was not identical with it. It was called phlogisticated air,\* or, as an alternative azot or azote ( $\alpha$ , privative, and  $\zeta\omicron\tau\iota\kappa\omicron\varsigma$ , belonging to life). Its modern name is nitrogen. Priestley, not knowing of Rutherford's work, also found it a little later, and for this he received the Copley Medal of the Royal Society.

It seems to us strange from our standpoint that though when phlogisticated air was "discovered" by Rutherford twenty years had elapsed since Black found "fixed air," yet the "air" which supports life and combustion (the "air" or "gas" we now call oxygen) was unknown. W. S. M.

(To be continued.)

## NURSERY NOTES.

### COOMBE WOOD.

(Continued from p. 94.)

*CLERODENDRON trichotomum* is a pretty white-flowered species, useful to the gardener at this season for greenhouse decoration; but the plant as usually grown has the drawback of flowering only when it is several years old, and therefore compelling the gardener to have relays of plants if he would have some of them in flower year by year. Mr. Howard, the manager at Coombe Wood, gets over this difficulty by grafting young wood on old stocks of the same species, which then flowers the next year afterwards.

The white *Escallonia philipiana* (*Gardeners' Chronicle*, July 27, 1878, with figure) was full of flowers, just going off in the middle of July. It is quite hardy, standing without protection in the border. The flowers are white, very numerous, and sweetly scented. Close by the above plant was a great bushy Japan Oak, *Quercus Burgeri* (acuta). It too is hardy, and possesses fine large evergreen foliage. Although seen here as a bush, it will, with timely pruning, form a stemmed tree.

*Osmanthus myrtifolius* is another small growing, quite hardy evergreen bush that would bear annual cutting, and would be well adapted for a garden hedge plant, or to take a place amongst formally kept specimen shrubs.

An ornamental standard, deciduous, small tree is found in *Cerasus Juliana rosea*, excellent for a sheltered position in a lawn. In *Ornus brachypoda* is found a Japanese representative of our flowering or Manna Ash. The foliage is larger, if anything, than the more common *Ornus*, and its hardness undeniable. Of Japanese *Acer* many were noticed—thrifty plants of some years standing, therefore of great hardness. It must be from some notion which

\* Air phlogisticated was distinct from phlogisticated air.

\* Van Helmont (b. at Brussels 1577) appears to have been the first to use the word *gas* in the sense in which we use gas. The exact year is uncertain, and so is the date of the first publication of his paper. As no question of priority is involved it is not of importance.

has got about as to this point, which has lessened their distribution in gardens. Here the plants do not suffer in the winter at all, and rarely do the young shoots get nipped by late spring frosts. For grouping by themselves, or as "starers" amongst other shrubs with nearly uniform tints of green, they are invaluable. They might be employed for garden hedges, when, by cutting them twice within the summer months, young shoots would be produced all over the plants, the tender crimson, yellows, pinks, and whites of which would have a beautiful effect.

*Acer dasycarpum*, likewise of Japanese origin, is a tree whose young shoots and leaves are red; the mature foliage is very handsome. Other forms of Japan Maples observed were *A. argutum* and *A. macranthum*, the foliage of both of which turns to bright scarlet in the autumn. *A. Reitenbachii* is a Norway Maple, whose young foliage has reddish hues. *Betula laciniata pendula* is the perfection of a solitary tree for a lawn or a conspicuous corner, as is *Salix laurifolia* for the lake-side; the foliage of the latter is large and striking for a Willow. *Ptelea trifoliata* is quite at home in similar positions, and the golden-leaved variety equally so. *Styrax obassia* is a plant with fine foliage, and is highly decorative apart from the flowers. (See p. 131, fig. 14.)

## FRUITS UNDER GLASS.

**Figs.**—The weather for some time back has not been of a favourable character for the production of luscious fruit, the temperatures having been maintained largely by artificial heat. Where early trees are producing their second crop of fruit, the atmosphere will have to be kept much drier than was recommended for the trees when swelling the crop. On the other hand, aridity would speedily cause respiration to put in an appearance. Gather the fruits as they are fit—the fruit which is to be used at once—when the skin is quite tender. If the fruit is to travel, it must be picked rather under-ripe. When the fruits which are ready are picked a good syringing may be given to the trees, and the night temperature maintained at 75°, with air admitted. Where the trees are grown in tubs or pots, plenty of some kind of weak stimulant should be afforded to assist them in finishing their crop. Strip off all late shows. Trees which require shifting should be seen to as soon as they have finished fruiting. Guard against over-potting; once in two years is quite often enough to shift Figs, if all has gone well. Use for potting compost good turfy loam, lime-rubbish, and Thomson's manure. See that the drainage is properly arranged, and of sufficient quantity.

**Melons.**—The present season is not what could be termed a good Melon season, as abundance of sunlight is indispensable to high flavour. The dull sunless, and cold weather is favourable to canker in the stems, unless syringing and watering are conducted with great caution; syringing should only be resorted to on very bright afternoons, and a simple dew over will meet the requirements of the plants on all other occasions. Confine damping to the paths, and keep all moisture from the stems of the Vines. Let the temperature be kept about 75°–80°. Maintain a dry atmosphere and a good circulation of warm air in houses where the fruit is colouring. It has been a difficult task lately to get Melons in frames to set their fruit satisfactorily. Where heat is supplied from fermenting material alone it will be necessary to apply fresh linings to keep up the requisite temperature. During cold nights, when the thermometer falls to nearly 40°, some covering should be placed over the glass at dark, and removed as soon as possible in the morning. When pinching is requisite let the work be carried out as early in the day as possible, when the sun strikes the frames, so that the sap from the wounds may be dried up before the frame is closed for the night. Let each fruit be elevated on the top of a flower-pot, so as to get all the sun and air possible, and turn the fruit every other day. The latest sowing for the season should now be made. This will be the last crop of Melons, but unless the season turns out sunny they will not have much flavour. This lot of plants it will be as well to grow in pots. Place a shallow box on the top of the hot-water pipes. In this place a layer of turf, and stand the pot on the top; when the roots emerge through the pots a little fresh compost can be placed over them, and the roots in the box can be watered without running all the water through the pot.

**Cucumbers** in full bearing must have rich light top-dressings placed over their roots as they appear on the surface. Old plants which show distress may be cut over and allowed to break afresh. Keep dry at the root, but syringe two or three times a day until the young shoots develop a few leaves. Shade during the bright part of the day. When growth becomes rapid, remove a portion of the old soil from the roots, and replace with fresh. See that the bottom-heat in dung frames is kept up; where it has declined, fresh linings must be applied.

**Train and pinch** the points of young plants which were recommended to be sown last month. Do not allow them to bear until they have furnished the trellis. Now is a good time to sow for winter. Let the structures be thoroughly cleansed before the seeds are planted. As they have a long season of dull, ungenial weather before them, it is important that they should receive all available light possible. Also the season is not favourable for dealing with spider and other pests, hence the advantage of a clean start.

**Strawberry Plants for Forcing.**—These plants should now be in their fruiting pots, and when they have begun to make fresh roots they should be placed where they are intended to make their growth—a piece of ground with a good bottom of clinkers or stones, covered with a couple of inches of screened coal-ashes or gravel. The situation should be fully

exposed to the sun, and a good plan is to mark out the ground into beds, for the easy examination of the plants. Some growers provide trellises for the plants. This is undoubtedly a good plan, if the weather be wet, or for late autumn treatment; but where several thousands of plants are grown it is an item of considerable expense, but where it can be carried out, by all means let it be adopted. The plants must receive careful attention as to watering, the runners closely kept pinched off as they appear, and the pots kept clear of weeds. Such varieties as *Vicomtesse Hericart de Thury* and *Sir Charles Napier* have a great tendency to throw off several crowns. This must have attention, and the best crown only allowed to develop itself, the others being removed. It is scarcely possible to recommend sorts of Strawberries for forcing, as some varieties succeed admirably in one district, and refuse to grow at all in another. *W. M. Baillie, Luton Hoo.*

## THE FLOWER GARDEN.

**Roses.**—Any budding that yet remains to be done should be pushed forward. Where this work was begun in good time, the earliest buds inserted had better be examined and the ties loosened where necessary, neglect in this matter often resulting in injury to the swelling buds. Look over *Tea Roses* and strong growing varieties that are trained against walls, pillars, or trellises, cutting out all weakly and superabundant growths, not forgetting to tie or nail in the strongest shoots as often as becomes necessary, not overcrowding them, but allowing space for proper development. If mildew has made its appearance, no time should be lost in checking its course. Mildew compositions may be obtained from most seedsmen. Cut off seed pods; and pull up all suckers from *Manetti* stocks.

**Carnations and Picotees.**—Layering of these must now be carried forward, and for this purpose use a compost consisting of three parts loam, one of silver-sand, and one of leaf-mould, the whole to be passed through a fine sieve previous to using it. The operations of layering, it may be stated for the benefit of the inexperienced, consists of pinching off the bottom leaves from the strongest shoots of the current year's growth; cut off also the points of the leaves; afterwards spread in between and round the shoots a 2-inch thickness of prepared compost, press down moderately firm, and with a sharp knife make a clean cut halfway through a fully developed node or joint, the knife entering just below, and drawn upwards in a slanting direction so as to form a tongue, then with a short hooked peg secure in proper positions the young shoot in prepared compost, adding another inch, or half inch, of the latter over the base of the layers. Should dry weather be experienced afterwards, they must be kept watered through a fine rose watering-pot till rooted. Weak growing varieties are best propagated by cuttings put in well-drained clean 5-inch pots, and placed on a gentle hotbed, and shaded from bright sunshine.

**Outdoor Ferneries.**—These should be looked over again, and freed from weeds if necessary. The fronds of most species are now fully developed, and are rapidly coming into fructification, so that the proper time has arrived for the cultivators to ascertain the correct names of species and varieties of any plants in his collection of whose nomenclature he entertains doubt. The Editor of this paper will name species of not more than six specimens at a time; but it would be too much to expect him to name varieties, and these had better be referred to specialists. Amongst the best of the British Ferns we have here at the present time, I may mention *Athyrium*, *E.-f. Craigii*, *A.-f. Victoria*, *A.-f. corymbiferum*, *A.-f. spinosum*, *Cystopteris fragilis*, *Allosorus crispus*, *Polystichum lonchitis*, *P. angulare* Baylin, *Scolopendrum v. Clitiffi*, *S. v. marginatum*, and *Isoetes* them here as worthy of cultivation in any well kept garden, either on rockeries or for planting amongst old stumps and roots of trees in shady nooks and corners. They range in height from 4 inches to 2 feet. Many more native species and varieties equally good might be given, but it is not in brief calendarial notes that they can be noted.

**Lawns.**—It will be a good plan to skim these over with the scythe, so as to take off the long bents that escape cutting, by the machine, and it will also be advisable to give some attention to any weeds which may be found on the lawn. Cut out Plantains, and destroy Dandelions by applying a drop of vitriol to each crown. *J. Horsfield, Heytesbury.*

MESSRS. SALTMARSH & SONS, THE MOULSHAM NURSERIES, CHELMSFORD.

Coniferous plants are an important feature, and planters would here find a choice selection from which to draw supplies. While there is a general nursery stock, fruit trees form a considerable portion of it, and Messrs. Saltmarsh & Sons have long been famous for their standard Mulberries. Florist's flowers, such as Dahlias, Verbenas, Phloxes, &c., can also be seen in good and choice collections; and as exhibitors of the first-named, Messrs. Saltmarsh & Sons are very successful at the Crystal Palace and other exhibitions. Against the offices can be seen growing a venerable Clematis Jackmanni, with a stem the girth of which is just 1 foot. It is probably one of the earliest plants sent out by Messrs. Jackman & Son, of Woking. It has to be pruned back hard every year in order to keep it within bounds.

Among objects of interest are a bush of *Genista hispanica*, the Spanish Gorse, which forms a dense hemispherical bush, covered by a mass of yellow flowers in spring; the foliage sprays are elegant at all times; *Ligustrum ovalifolium variegatum*, a very handsome golden shrub, increased by means of cuttings; the green-leaved type is also desirable, as the early autumnal frosts change its foliage into bright purple tints; the purple-leaved *Filbert*, *Corylus Avellana purpurea*, is also striking, having beautiful dark purple foliage, with fruit to match; the fruit also is sweet and pleasant to the taste; *Quercus coccinea*, the variegated Turkey Oak, a tree that is in fine character late in the season; *Cistus roseus*, and that noble Cherry-Laurel, *Cerasus latifolia*, with its fine dark green leaves. These are but a few of the choice handsome ornamental trees and shrubs to be found in the nurseries.

In the way of Coniferous plants there is a very fine specimen of *Abies nobilis* glauca, 35 to 40 feet in height, and probably over thirty years of age, a grafted specimen; a very handsome form of the golden *Cupressus Lawsoniana*, 10 feet in height; *Cedrus atlantica glauca*, very fine; glaucous-tinted form of *Cupressus Lawsoniana*, a very handsome silvery form of the common Yew, which came among a batch of seedlings, and which Mr. Saltmarsh has appropriately named *albo spica*; some fine specimens of *Picea orientalis*, some seedlings from *Thuia gigantea*, much more dense in growth than is usual, and which do not take the usual pyramidal form. Lovers of Coniferous trees and shrubs will find much to interest them at this season of the year.

While all kinds of fruit trees are in demand, there is a brisk run upon some leading sorts of Apples, such as Ribston Pippin, Norman Wonder, Cox's Orange Pippin, Blenheim Orange, &c. The new Queen Apple is in brisk demand, and Mr. Saltmarsh consider it one of the best late keepers grown. Trained fruit trees of all kinds receive careful attention. Standard Plums are well grown. Mulberries are largely propagated, standards finding a ready sale; but it takes from five to six years to get them into saleable size. They are layered in spring from stools, they lie so for two years, then they are taken off, planted in nursery beds, and gradually trained into standard form. *R. D.*

*Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.*

Transit and Distribution of Fruit.

FEW matters in connection with fruit-growing in this country more need improvement than the transit and distribution of fruit, affecting as they do an enormous amount of capital, and to a large extent the welfare of our teeming population. The two are so closely connected, that at first sight it appears somewhat difficult to separate them, but for the sake of convenience it is desirable to do so, in the hope that, by so doing, the two questions will be presented to those whom they most concern in a clearer light than would be the case if they were treated singly.

Of the three modes of transit of fruit to market—viz., by water, road, and rail—we purpose now dealing with the latter only, as it is to the majority of fruit growers, and to a certain extent to the consumer as well, the one of most importance. Are the existing ways and means employed by railway companies for the transit of ripe fruit over long distances the best, or can they be improved upon? These are questions which at times many fruit-growers must have asked themselves, particularly in such weather as was experienced last summer, and they have probably often felt puzzled to form a definite or very decided opinion on the matter, except the one that their returns ought to have been considerably higher. Great improvements might be brought about with great advantage to buyer and seller, but as the matter is one which rests mainly between the railway companies and the fruit growers, the latter ought to approach the former in an amicable spirit, lay the matter clearly before them, and the probabilities are that their requirements would be met, and the whole question settled, in a very short space of time. Under the prevailing mode of transit,

tons of produce of high quality when first gathered, and which ought to form a portion of the food supply of our population are absolutely spoiled and rendered unfit for human food for the want of an improved system of carriage, this being especially the case with such soft fleshy fruits as Strawberries, Cherries, Raspberries and Plums, in such unusually hot weather as was experienced last summer.

The present type of railway van used for the transit of fruit is a closed covered carriage, devoid of ventilation save that by the doorway; and it is obvious that in such a structure as this the temperature during July, August, and early part of September, must often range from 70° to 90°. Under such conditions, deterioration and consequent loss of profits must inevitably take place in a journey of 200 or 300 miles—say from Kent or Hampshire to the North of England; and we may feel perfectly sure that among the above-named kinds of fruit fermentation and decomposition have set in long before they are sold in the open market, and that they are in consequence disposed of at ruinously low prices. Independently of the grower's returns, the question merits notice from the consumer's point of view. How much better off would the latter be with 1 lb. of good sound fruit than he would be with double the quantity of partially decayed fruit, we can hardly venture to state; suffice it to say that he must be better in health and probably in pocket also in the long run. Practical men who thoroughly understand their business need no arguments to convince them that a consignment of ripe fruit—say, for instance, Strawberries or Cherries—would arrive at their journey's end and be placed in the market in a better condition, if the inside temperature of the van used in their transit had not exceeded 50° than would be the case under a very much higher temperature—say 80° or 90°.

From this the inference will at once be drawn that properly constructed vans, in which a low temperature can be maintained in hot weather, are a necessity which ought not to be beyond the skill of railway carriage builders, who have the American fruit-trains as a pattern. At the bottom of a closed covered van there might be a cold-air chamber, over which iron grating could be fixed instead of wood flooring, as at present, with a good system of ventilation at the top and bottom for ingress and egress of air. If by this plan the temperature cannot be kept down to something like 50°, then other means should be tried. Of course a suggestion of this nature, on first being mooted to managers and directors of railway companies, will almost of a certainty be treated with something akin to ridicule, and be described as fanciful, with the additional epithet, "It won't pay." Well, innovations on old customs are usually treated this way, but that need not for a moment daunt the ardour of those whose business it is to reap the greatest benefit they can from the fruits of their own labour. With a little perseverance it will be found in the long run that railway directors are quite as accessible and open to entertain reasonable proposals as freely as any other class of men.

At a time when a Railway Rates Bill is being dealt with by the Legislature—the principal object of which is to reduce terminal charges and rates—it is scarcely expedient to venture the suggestion of a slightly increased charge for this improved accommodation, however the argument may be advanced that an increased traffic would be the eventual result, and in that way directors and managers of companies might possibly be convinced that the change would be to their own interest. These specially constructed vans or

carriages for fruit ought to be attached to all passenger trains running through the fruit-growing districts, if possible, from the middle of June to the middle of September. With regard to consignments of fruit conveyed in open trucks by goods train there is not so much to complain about; still, some improvement might with advantage be even introduced here. In the first place, instead of the present form of close flooring, the latter ought to be so made as to allow of a current of air to come from underneath, and this could easily be done by allowing a space of 2 or 3 inches to intervene between each strip of planking. One or two other improvements might be introduced at the same time, to obviate the practice of loading hampers and baskets too closely together. Half an hour's conversation with a railway engineer by the side of a van or truck would put the whole matter in a clear light, and the sooner some improvements, of whatever kind, in the direction indicated are brought about the better it will be for fruit growers and the public at large.

With reference to this subject we draw attention to the packing-case (see fig. 15, p. 135), designed by Mr. TALLERMAN, of the Commercial and Agricultural Co. (Limited), and exhibited by him at the last meeting of the Royal Horticultural Society. The idea is so to pack soft fruits generally that they shall not be liable to damage from the ordinary exigencies of railway or other usual modes of conveyance. The crate, which is made of slight spars of deal, is 14 inches in width, and the same in breadth, by 16 inches in height. It is intended to hold securely sixteen cardboard boxes, each of which will hold from 1½ to 2 lb. of fruit, according to kind. This method of packing would seem to recommend itself especially to the notice of persons who obtain their supplies of fruit direct from the wholesale dealer or the grower.

The distribution of fruit is quite as important as transit, and although we have a more perfect railway system than that of any other country in the world, it is greatly to be feared that a good many fruit growers fail to reap such advantages therefrom as the nature of the case would seem to warrant, but which they undoubtedly would do by a slight deviation from old and too well worn ruts. It is undeniable that far too many persons regard London as the central depot for their produce, and as a consequence, the markets of the metropolis are at times glutted with fruit, much of which, after being sold, and after deducting salesmen's commission, carriage, and other incidental expenses, leaves but a very narrow margin of profit—sometimes none at all—for the grower. The same kind of thing may occasionally occur in two or three other large centres of industry, although not to the same extent, nor yet so frequently as in the London market. Is it possible for this state of things to be altered for the better? or can a remedy be found that will obviate the evil of causing a glut in some few of the largest markets, whilst at the same time comparative scarcity prevails in many others? These are questions which will force themselves to the front in due course, as the fruit-growing industry extends, and will demand a solution in some form or other, or the consequence will be that a vast amount of capital—and which is annually increasing in fruit farming—will not only fail to return interest, but will be absolutely lost. In considering these matters it is necessary to take into account two matters, viz., distribution in its relation to supplies derived from existing resources, and a means of enlarged distribution that will be able to cope with annually increasing supplies. Of

FIG. 14.—*STYRAX OBASSIA*: HARDY SHRUB: RACEME PENDULOUS: FLOWERS WHITE, FRAGRANT. (SEE P. 133.)

course a system that will be applicable to the future, will be more than ample for present purposes, therefore all that is put forth with a view to remedy existing defects must necessarily apply to future requirements also. In regard to the present state of things it has always occurred to us that large growers of fruit might with advantage take a lesson from a custom that has long prevailed in the milk trade, *i.e.*, sale by contract. Selling by contrast may prove a difficult and hazardous question in regard to fraud, though it is adopted in some parts of Kent, indeed, as a matter of fact it might with some kinds, and under certain contingencies, prove altogether unworkable. Notwithstanding that, however, there are other kinds of fruit that might be sold under the contract system just as easily as milk is. Let us take for example a crop of Grapes or Peaches, grown under glass: any man who has the growing of these under his charge, and who thoroughly understands his work, will be able to estimate to a nicety some weeks before the crops are ripe what his probable yield will be, and the same may also be said of Apples, Pears, Plums, and one or two other kinds of fruit. Under such circumstances as these what could be better than to make arrangements with the retailer or shopkeeper some time beforehand to supply by contract at per pound, dozen, or bushel, to be delivered on, or between specified dates? If a grower cannot agree with his customary buyer—be it in London or any provincial town—upon a certain price, he will have time, under this plan, to write elsewhere, and it stands to reason that he will be more likely to derive benefit by knowing what his returns would be than he would if he sent his produce to be sold on commission simply for what it would fetch.

In the distribution of home-grown fruit the commission salesman must be regarded as a necessary evil, to be avoided as much as possible, in order to benefit both producer and consumer; the latter certainly would thus be a gainer to the extent of having fruit of a better quality, for it cannot be denied that the less "knocking about" there is with this kind of food the better. It is not at all an uncommon occurrence to see fruit sold in London and other large centres, on stalls and costermonger's barrows, at infinitely cheaper prices than would have to be paid for the same article in rural districts. Any system of distribution that will tend to remove such inequalities—be it by contract or some other plan—will be a step in the right direction.

Having touched briefly on the present state of things, let us take a cursory glance at the future. Within the past few years hundreds of acres of land have been planted with fruit trees, and so far as it can be judged from present circumstances, this will be added to yearly to an indefinite extent, supplanting, in a great measure, the growing of corn crops, which with our large importations is becoming less remunerative year by year. Now the question arises. In what way is this promised increased supply of fruit to be treated so as to avoid unnecessary waste, loss of capital, and loss of food to our fellow creatures? When looked at from a broad and comprehensive point of view, it will be admitted by most persons that our present system of distribution will require to be greatly extended and improved upon. To meet the difficulty the only remedies that present themselves are increased market-accommodation and the establishment of fruit factories. In all large towns the present number of markets might very well be doubled, and, in some instances, a larger number than this even might prove advantageous. In many of the smaller towns also greater facilities for whole-

sale trade purposes are urgently needed, and in all cases the nearer to the railway station these markets are the better. Railway companies themselves in the majority of towns could doubtless supply this want, and there can be no doubt that they would greatly benefit thereby, as they would add largely to their income from increased traffic receipts and market-tolls. With regard to fruit-factories, here again we think may take a lesson from dairy farming, and build them at the source of supply, as is done in Kent and elsewhere, instead of in the large towns, as they mostly are at present. In all large fruit growing districts there ought to be one or more of these factories where fruit could be taken in any time between Monday and Saturday to be made into jam, and some kinds to be converted into articles of food by a process of drying. There appears to be a great future in store for home-grown dried fruit, and probably we shall hear more about this part of the subject at no distant time. The two Fruit Conferences to be held in the coming autumn we are pleased to see are likely to take up these and similar questions, and we sincerely hope that practical benefit from them may accrue to all concerned.

**ROYAL HORTICULTURAL SOCIETY:** THE APPLE AND PEAR CONFERENCE AT CHISWICK.—The joint executive committee of the former Apple and Pear Conferences met at Chiswick on Tuesday last, under the Presidency of Colonel Beddome, representing the Council of the Royal Horticultural Society, the Rev. W. Wilks, Hon. Secretary of the Society, being also present, Mr. A. F. Barron acting as Secretary. The following members attended:—Messrs. Shirley Hibberd, F. Q. Lane, Haycock, G. Bunyard, A. Turner, Cheal, Herbst, Roberts, Hudson, A. Dean, Wildsmith, and J. Wright. A prospectus of the proposed Conference, with schedule of classes for the respective fruits, issued by the Council, was submitted and discussed freely, several very important amendments being made, foremost amongst which was one fixing the date of the Conference for October 16 to 20, so that it should not clash with the hardy fruit show at the Crystal Palace of the preceding week. Papers on subjects arising from or connected with the Conference are invited from capable persons, which, it is hoped, arrangements will be made enabling them to be read, and as far as possible, published. As the schedule of classes as amended, and which will shortly be issued, shows, the Conference will partake chiefly of an horticultural character, but the invitation of "orchard-grown fruit" shows that an even wider cultivation of Apples and Pears has not been lost sight of. It is specially worthy of note that whilst collections of diverse characters are invited in each case, not only the number of varieties but the number of fruits of each variety is limited, as were competitive efforts to exhibit allowed the greater bulk would be intolerable. To exhibit five large fruits, or up to nine small ones of any variety will distress no one. The collection specially representative of districts should prove particularly interesting, whilst remembering that this year both Apples and Pears are but partial crops, still it is hoped that a general response to the invite to exhibit at the Conference will be made.

**THE GARDENERS' ORPHAN FUND.**—The monthly meeting of the committee, and the first meeting of the new elected body, took place at the "Caledonian" Hotel, Adelphi, on the 27th ult., there being a good attendance. Mr. GEORGE DEAL was unanimously elected Chairman of the Executive Committee for the ensuing year. The minutes of the previous meeting having been read and signed, the Hon. Secretary reported that the sum of £736 14s. 4d. stood to the credit of the Fund at the bankers. It was unanimously resolved that a further sum of £500 be invested in "Goschens," making £1500 in all. The accounts of the recent dinner

were laid before the meeting, and were considered highly satisfactory. Hearty votes of thanks were passed to the President, Sir JULIAN GOLDSMID, Bart., M.P.; to the donors of plants, flowers, and fruits; and to the vocalists, for their assistance and support at the recent dinner; also to the local secretaries for their valuable services during the year. The Chairman announced that he had recently had an interview with Mr. N. SHERWOOD, of Messrs. HURST & SON, Houndsditch, E.C., and that gentleman had generously promised the sum of £100 towards placing another child upon the Fund in accordance with the provisions of Rule XII. The committee unanimously resolved that Mr. SHERWOOD's generous offer be accepted with hearty thanks, and that a child four years of age be placed upon the Fund for the period of ten years. Mr. SHERWOOD having waived his right to nominate a child, it was unanimously resolved to nominate and recommend to Mr. SHERWOOD as the recipient of his bounty KATE HARRIET BROOKS, of Holmsworthy, Devon, one of a family of ten fatherless children, two only of the number being able to earn anything towards their support. This case is strongly recommended by the Rector of Holmsworthy. It was resolved that the allowances to the ten recently elected children should date from July 1. Forms of contract and receipts were approved, and the Chairman and Hon. Secretary appointed as a sub-committee to carry out all the foregoing arrangements. It was stated that in the case of the recently elected children the grandmother would have the custody of the child in one instance, uncles in two others, and mothers in the remainder. It was resolved that 3000 copies of the annual report, balance-sheet, and list of subscribers be printed for circulation, and 500 collecting cards be obtained, as many persons appear to be willing to give small sums. Various accounts were ordered to be paid, and the committee then adjourned until the last Friday in September, the Chairman and Secretary being empowered to convene a special meeting if necessary.

**THE BATH FLORAL FÊTE.**—The committee of the above have issued a special prize schedule for the exhibition in the Sydney Gardens on September 5 and 6, and several classes of botanical interest are contained therein in honour of the visit of the British Association. Prizes are offered for a hybrid Orchid, and hybrid or cross-fertilized plants, also for Ferns of several species. In all cases of hybrid plants it is requested that illustrations of the parents from which they were obtained be also submitted.

**LORD JUSTICE LINDLEY.**—The autumn graduation ceremonial of the University of Edinburgh took place on Tuesday, August 1. Professor KIRKPATRICK proposed for the honorary degree of Doctor of Laws Sir NATHANIEL LINDLEY, Lord Justice of Appeal. He said, as the honoured name of Dr. JOHN LINDLEY was a household word among botanists and men of science, so that of his son (Lord Justice LINDLEY) was a household word among lawyers, not only in England, but in Scotland also, and indeed wherever the English language was spoken.

**THE "TROPICAL AGRICULTURIST."**—The seventh volume of this publication is now completed, and like its predecessors contains a perfect mine of information on subjects connected with tropical agriculture and economic botany. The information is gleaned from many sources, but the editors are careful to cite date and chapter, if not verse, for all their extracts, and they are most honourable in citing their authorities. A full index renders the volume comparatively easy to consult. The publication, though issued at Colombo, Ceylon, is adopted for all tropical countries.

**TROPICAL PRODUCTS.**—We have received from M. F. W. VAN EEDEN, the Director of the Colonial Museum at Haarlem, a series of handbooks illustrative of that notable collection. The subjects

treated of include the trees, timber, and fibre plants of the Malay Archipelago, by M. VAN EEDEN; Cinchona, Coffee, Tea, Sugar, Cocoa, Vanilla, Rice, Tobacco, and Spices, by R. W. VAN GORKOM; Fruits, Drugs, &c., by F. HEKINER; Fats, Oils and Gums, Caoutchouc, Gutta-percha, by Dr. DE LOOS. Unfortunately for us the text is written in the Dutch language; but the indexes of botanical, commercial, and vernacular names render the books useful even to those unfamiliar with the language of the Netherlands and of the Dutch possessions in Malaysia.

**DUTCH BULBS.**—The weather in Holland this summer has been in general cold and rainy like in other countries, and so the season is more backward than usual; the harvesting of bulbs, in consequence, will take place at a much later date than ordinarily is the case, as one of the principal rules in their cultivation is never to take them up before they are well ripened—the flowering qualities being injured by too early removal; thus, the bulbs (especially Hyacinths and Narcissus) will probably be ready a fortnight later than in ordinary years, when the first days of August see the beginning of the exportations. It is reported that several of the leading firms in the bulb trade do not intend to begin sending out their bulbs until they are quite fit for the purpose. It is to be hoped that this system will be generally adopted by the Dutch growers.

**BRITISH TOBACCO.**—The report of the judges appointed to determine the award for the prize of 50 guineas offered by the London Chamber of Commerce for the best specimen of British-grown Tobacco has now appeared. The conditions made when the prize was offered required that each specimen of Tobacco submitted for competition should consist of not less than 400 lb., grown on a commercial scale. It was also stipulated that each sample should embrace an average of the crop grown, and that the growers should give such particulars as would assist the judges in making "a report on the yet doubtful question as to the possibility of growing Tobacco in Great Britain such as in quality relatively to price can compete with that of other countries." The entries numbered eleven, and were duly inspected at the Fenchurch Street Bonded Warehouse on May 14. It was found that only four exhibitors had complied with the conditions so far as quantity was concerned; but in view of the interest which is being manifested in regard to Tobacco growing in the United Kingdom, the judges considered it desirable to present a supplementary report on the remainder of the specimens, though not properly coming within the scope of their adjudication. They placed the four exhibits submitted to them in the following order of merit:—1st, Messrs. James Carter & Co.; 2nd, Mr. W. L. Wigan; 3rd, Sir Edward Birkbeck, M.P.; 4th, Mr. John Graves; and they recommended that the prize of 50 guineas should be awarded to Messrs. James Carter & Co. Detailed particulars, furnished by the growers, as to the cultivation and preparation of the samples sent in for competition are given, together with remarks of the judges on the various exhibits. In concluding the judges state that, speaking generally, "not one of the four samples eligible for the prize was in any respect valuable for trade purposes, or even merchantable, presuming that no duty was chargeable upon the article. Still, it was evident that well grown Tobacco leaf could be produced upon English soil, though, of course, this admission in no way takes account of the cost of production. With regard to the prospects of Tobacco-growing on a remunerative basis in England, we share the opinion that, even under the most favourable conditions possible, such a crop cannot be made to pay, and that in most seasons it must be an absolute failure and heavy loss. The climate of this country, to begin with, is less favourable than that of Kentucky or Virginia, and the cost of production will be found far greater here than in the United States. Until the curing of Tobacco is perfectly well understood in the United Kingdom the finest leaf that can be grown will be absolutely wasted and useless." The judges were Dr. J. Bell, F.R.S., Somerset House; Professor W. Fream, LL.D., College of Agriculture, Downton, Wilts; Dr. J. Augustus Voelcker, Mr. Henry F. Moore, Frome, Somerset; Mr. W. H. Willis, Mr. James Biggs, Mr. Louis Morris (Tobacco manu-

facturer), Mr. Algernon Gilliat (merchant), Mr. James Chambers, Mr. G. H. Ball (Tobacco brokers), and Mr. C. A. Müller (Tobacco importer).

**WANTED.**—The Editor would be obliged if any reader would kindly send him a copy of the *Gardeners' Chronicle* for June 18, 1881. Full price will be given.

## STYRAX OBASSIA.

Messrs. VITCH are receiving the well merited reward of their enterprise in introducing through the late John Veitch, Mr. Maries, and others, a series of hardy Japanese plants of various kinds. A visit to the Japanese quarters at Coombe Wood is always a source of delight to those interested in beautiful or interesting plants.

Among their numerous introductions of this character there are none to surpass the very beautiful hardy shrub above-named. The shrub in question was first made known to the botanist in Siebold and Zuccarini's *Flora Japonica*, vol. i., t. 46 (1835), where a full description and illustration are given. As our illustration (fig. 14), conveys an accurate idea of the shrub, we need not enter into further detail save to point out that in Zuccarini's figure the inflorescence is shown more pendulous than in our drawing, which was taken by Mr. W. G. Smith from the cut specimens exhibited at one of the meetings of the Royal Horticultural Society in the spring, when it was awarded a First-class Certificate.

One peculiarity may also be mentioned, and that is the fact that the buds are concealed in the base of the sheathing leaf-stalks almost as in the Plane tree. The flowers add fragrance to their charms. The plant was first made known from the gardens of Japan only, but it has since been found wild on Fusi Yama and other localities in Japan, as well as in Corea. The word *Obassia* is from the Japanese, but we regret to be unable to give its meaning.

Other species, such as *S. officinale* (from which the drug *Storax*, used in incense, is, or was, procured), and *S. japonicum*, are grown in gardens, but the present species is superior to all in elegance.

## TREES AND SHRUBS.

### STRIKING KALMIAS.

THESE plants are easily propagated by cuttings of the young shoots inserted in sandy peat, under hand-lights and placed in a shady place; or, by seeds sown in shallow pans of sandy peat, and kept close in a frame until the seedlings are up, when they may be pricked off, and kept close again, until rooted afresh, and then gradually inured to the open air before planting out. Owing to their having a dense mass of fibrous roots, Kalmias may be taken up and potted after the bloom is set without doing them any injury; and if assisted afterwards by gentle heat, and well syringed, they flower freely in winter continuing in beauty for several weeks in succession. *Kalmia latifolia*, a species with broad leaves and red flowers, will be found most useful for forcing; *K. glauca*, purple flowers; *K. angustifolia*, narrow leaves and red flowers; *K. lucida*, *K. nana*, *K. angustifolia ovata*, are all worthy of a place in the American garden. *W. A. Hodge*.

### RAISING OF EMBOTRIUM COCCINEUM FROM SEED.

Is your correspondent, "P. P.," at p. 8—writing in reference to this plant, sure that Mr. Bach has sown perfect seeds? In our experience here there has been no difficulty in the seeds germinating when we have been fortunate enough to get them, but the trouble has always been to get matured seeds. The seeds are, when matured, quite as large as that of the sweet Pea, but not so round. The peculiar twist of the stamens prevents easy fertilisation by insect agency; I have, therefore, with a camel's-hair pencil artificially fertilised the flowers, and have thus secured perfect seed. When the plant is very full of flower it is best to pick off most of the seed-pods,

when it will be found the remainder will often produce good seed without artificial aid. The best time for sowing is directly the seeds are ripe. I have kept them until spring, but have not been anything like so successful as when I have sown at once after the pods begin to crack or split in two pieces. There are many plants in Cornwall equal to, and larger in proportion, than the one your correspondent alludes to, but the difficulty of increasing them lies in getting the seed, and not in the seed germinating. Two seeds in a pod is the most I have seen; the blind scales of which the pod is full have been sown for seed in some cases, and of course resulted in failure. *Henry Mills, Enys, Penryn*.

### FLOWERING OF EUCALYPTUS GLOBULUS.

There is now in the garden of Beaconhill House, Exmouth, Devon, a tree of *Eucalyptus globulus*, which in a few days will be a beautiful sight—at present there are some hundreds of flowers open and a large number of buds are about to expand. The height of the tree is about 30 feet, and at 6 feet from the ground, measures 24 inches in circumference. It was planted about seven years ago. Does not such a specimen speak well for our mild climate? *W. J. G.*

## CULTURAL MEMORANDA.

### DELPHINIUMS.

AT this season of the year there are few, if any, more strikingly beautiful plants in borders than Delphiniums, sending up, as they do when good varieties are obtained and cultivated, fine towering spikes of brilliantly coloured flowers, varying from scarlet to nearly all shades of blue. These remarks, of course, refer to the perennial kinds, of which there are now a great many, for besides the fine species that have been introduced, many hybrids have been raised, which have enriched gardens very considerably, and helped, where they are used, to make places much gayter than was possible without these tall showy plants.

Besides the numerous single kinds, there are several double sorts, and among the best of these may be mentioned Madame Henri Jacotot, Madame E. Geny, Roi Leopold, Michael Angelo, General Ulrich, Sphere, Trophy, Aureum, and Victor Lemoine. The finest of the singles are *Belladonna*—a lovely pale blue; the good old formosum, *Gloire de St. Maude*, *Celestial*, *Coronet*, *Hendersoni*, and *magnificum*. The only scarlet ones worthy of note are *nudicaule* and *cardinale*, both of which are very desirable, and were thought much of when they first made their appearance. These and all the other single perennial Larkspurs may be made to bloom much longer, and some of them almost continuously during the summer months, by cutting off the spikes immediately they have done flowering, and thus relieving them of their seeds, which are so exhausting to the plants on account of the quantity which they bear. Their freedom of bloom may be increased by giving them plenty of depth of soil, as they like "to send their roots well down, and it is only when they can do this that they are able to withstand the dry weather. This being so, the places in the borders assigned them should be well broken up by digging out holes; and if the land is at all poor a heavy dressing of rotten manure worked in at the bottom, which they will find and feed on, when it is of the most use to them—at the time they come into flower. The way to propagate the Delphiniums referred to is by division, as they soon make strong spreading crowns, and these may be cut through easily by using a sharp spade, which should be done early in spring, just as the plants are beginning to grow; and that is also the proper season to remove any and replant, which is very desirable every three or four years, as they exhaust the soil in time; but this may in a measure be prevented by mulching around the crowns, or giving a dressing of rotten manure. Although Delphiniums cannot be depended on to come true from seed, it is a good plan to raise them in that manner, as

finer kinds than the parents may show themselves, and all are sure to be valuable for the wilder parts of the garden, or to plant alongside of shrubby walks—positions for which these stately plants are well fitted.

#### SEED-SOWING.

Seed of Delphiniums may be sown as soon as it is ripe, employing boxes or pans and ordinary light garden mould, covering it with a little sifted soil of the same description, giving water through a fine rose and place in a cold frame. The frame should be kept close until the young plants appear, when sufficient air should be admitted to secure a sturdy growth, and the young plants, when large enough to handle, be pricked out in boxes or on a sunny border a few inches apart. If 2 or 3 inches thick of good soil be placed on a hard bottom the plants will make a more sturdy growth, and will lift better for the final transplantation than would be the case were they allowed more scope for the roots to ramble and porous soil to grow in. The Delphiniums, like kindred subjects, succeed best in a good loamy soil resting on a porous subsoil. *H. W. Ward.*

#### NEWER VARIETIES OF DELPHINIUMS.

The games of a collection of these flowers recently shown at a meeting of the Royal Horticultural Society by Messrs. Kelway & Sons, Langport, were Prince Oscar, deep blue, margined with bronzy-purple; Vosegus, rich bright blue, with slight margins of pale rosy-purple—a large single variety of great beauty; Mrs. Edgar Wild, blue exterior, the centre petals pale wine-purple; Ustane, delicate sky-blue, the centre pale blue, margined with delicate mauve, extra fine—a fine single flowered variety; Miss Pinney, very like the foregoing, but still distinct—a very fine variety; Lord Balfour, blue and rosy-lilac—very fine; Amelia, another fine single variety—colour bright pale blue; Imogen, pale blue, with slight edgings and dashes of pink—very fine; Frederica, fine bright blue, the top segments edged with pink; Lady Churchill, blue, slightly shaded with purple—very fine spike; Prince of Naples, blue and pinkish mauve; Sigrid Arnoldson, deep blue and rosy-mauve—very fine full spike; Lord Randolph Churchill, deep blue, shaded with mauve and pink—extra fine; and Valentina, a bright blue self. A better selection could scarcely be made than the thirteen varieties composing the foregoing list. *R. D.* [We have just received several spikes of very particular merit from Mr. C. Irvine, Jedburgh, to which we hope to refer next week. *Ed.*]

#### DIPLOADENIA BREARLEYANA.

The dark green leaves of this evergreen stove climber contrast effectively with its large grandly coloured flowers, opening pink and changing to the richest crimson. The plant is of free growth, and produces from May to October its flowers freely, and which stand well above the foliage. Cuttings of the young growth taken off with a heel of old wood during the summer, and inserted in small pots filled with peaty soil having a surfacing of silver-sand, watered and placed in heat, will take root within a few weeks. They should then be potted singly into small 60-size pots, and returned to heat, giving water at the roots and pinching the shoots once or twice, to make them branch after the roots have pushed into the soil. Shift into larger pots before the roots get matted until the plants are placed in their flowering pots, using four parts of good fibry peat and one of a like description of loam, with a sprinkling of sand added: and train the young shoots to a suitable trellis. *H. W. W.*

**THE WEATHER.**—Mr. G. J. Symons, writing in the *Times*, points out that the rainfall for July, though continuous and heavy, is not unprecedented in amount; the minimum temperatures have not been excessively low, but the maxima have been lower than for thirty years. In London 7.22 inches of rain fell between June 4 and July 31, on forty-six days, so that the fall was five times as frequent and seven times as heavy as during the corresponding months of last year.

## FLORISTS' FLOWERS.

### CARNATION GERMANIA.

This very fine self-yellow Carnation, raised and distributed by M. Ernest Benary, of Erfurt, certainly answers the expectations formed of it when only flowers were seen last year. It is of a pure clear yellow, remarkable for its full substance and fine petal; and with a refinement of character apparent to the most casual observer. It is a good grower also, putting forth freely robust grass. It has been announced as a Tree Carnation, and probably can be had to bloom in the winter, though I think it should properly be regarded as a summer flowering type. In the general character of the flowers it resembles Pride of Penshurst. and it may perhaps have been raised from it; but it is apparently of more robust growth and better quality of flower, and is sweetly scented. *R. D.*

#### TREE CARNATIONS.

We have had a succession of blooms from a very small lot of plants up till now (July 21), and the summer flowering varieties being now in flower, there has been no break in the season of bloom. Not many years ago there was cause of complaint in the season of bloom being so short—less than a month of bloom for a whole year of labour! Now there need not be any complaint of lack of flowers at any season, the perpetual flowering varieties being so easily grown. The plants should now be in an open position out-of-doors, and not be allowed to suffer for want of pot-room. A neat stick should also be placed to each plant, and the young growing shoots kept quite free from green-fly. The main point in their culture is to keep a uniform state of growth, which they will make better out-of-doors until the end of September than under glass, when some of the plants will be coming into bloom. *J. Douglas.*

## BOOK NOTICE.

**AUTOUR DE MON JARDIN.** Par Eugène de Daru. (Bureau, 11, Pont St. Laurent, Verviers.)

Among the crowd of books for the instruction of the intelligent amateur, who desires to gain a general insight into gardening procedures, we have rarely come across one better suited to its purpose than that whose title is given above. It is a dissertation on the general principles on which practical horticulture is based, and to those to whom the language in which it is written forms no bar, it will be found as pleasant to read, as it is sound in teaching. Clear, simple, and to the point, it is essentially well-written and not devoid of humour. It bears on every page the characteristics of an erudite and practised writer, while the practical details betray the hand of one who knows not only how to write about his garden, but also how to work in it. Its contents may be divided from the titles of the chapters, of which one is devoted to soil, air, and water; one to garden appliances, others to garden design, garden decoration, garden pests, and garden friends. A detailed table of contents and a full index complete an unpretending, but excellent work. A slight *lapsus* on p. 11, where nitrogen is spoken of as derived by the plant from the air, may be pointed out—a statement inconsistent with another and more correct one on p. 13, where the nitrogenous matters are rightly spoken of as entering by the root.

## PLANTS AND THEIR CULTURE.

**PELARGONIUMS.**—Zonals which were struck in the spring and were subsequently potted into large 60's, and which for some time may have been standing in the open, are now in capital condition for potting up for winter flowering; the size most suitable is 32's. Employ sound loam with a liberal addition of bone-dust, a small quantity of decayed manure or leaf-soil, a sprinkling of soot, and as much sand as will give

porosity. In potting, press the soil quite firmly, and pinch off all flower-spikes, and stop any straggling shoots. Plunge the pots thinly in coal-ashes, and if in frames so much the better, as they are then quite under control.

**Gesneras.**—Tubers of *G. cinnabarina* which are now starting into growth should be shaken out of the old soil, and repotted. I like to put them into their flowering pots at once, any after assistance that may be required being given in the form of liquid manure. A rich porous soil suits them well, that is, one consisting of about one-half loam and fibry peat, with a large admixture of silver-sand. Owing to the hairiness of the leaves syringing is not advisable, for if there is any sediment in the water used it is sure to settle on them and spoil their appearance; and for the same reason try and keep them free from insects, as washing in any form is equally injurious. A good position is one near the glass in a light pit, with a mild airy temperature between 60° and 70°. Late plants or cuttings of *G. zebрина* and *G. regulifera* may be treated similarly, so as to come in with *G. cinnabarina*.

**Hydrangeas.**—The common *Hydrangea hortensis* is probably the most useful, and is possibly not seen to better advantage than when grown in a small pot with a single flower-head. For this purpose cuttings should now be put in, selecting strong, clean, and moderately well ripened shoots. Insert them singly in small pots, using a light loamy compost. Give a good watering, and if the leaves are large and likely to flag support them by inserting a few small stakes round the edge of the pots, and run a bit of batten round them. It is well to try and preserve the leaves, for if they fall prematurely the cuttings take longer to root, and they are more liable to miss flowering when started in the spring. A frame placed on a gentle hotbed over which a few inches of plunging material has been spread is a good place to root the cuttings in; shade them from bright sunshine, and maintain a genial, glowing atmosphere, never allowing the cuttings to get over-dry, yet giving sufficient air to expel superfluous damp, otherwise the leaves would be apt to decay. In a few weeks they will be nicely rooted, and then more air should be given until they can stand full exposure. If large 60's have been used for the cuttings, this size will be large enough to winter in. During the winter months a cool, airy position, where frost is excluded, suits them well; but if smaller pots have been used, pot the plants soon after they are rooted, and again when started in the spring; 5 and 6-inch pots are large enough. A rich loamy compost should be afforded them. This season may be prolonged by periodically introducing batches into a mild heat; they usually show flower after a few pairs of new leaves have been made. There is also a white-flowered variety, *Thomas Hogg*, and a variegated variety of *hortensis*, both of which are worth growing, but they look best as small specimens. Old specimens which have flowered are better stood out-of-doors in summer-time; but a few degrees of frost will, however, not do them any harm. *F. Ross, Bletchingley, Surrey.*

## HOME CORRESPONDENCE.

**THE BEGONIA AS A BEDDER.**—I can fully endorse all that your excellent correspondent, Mr. J. Horsefield, has said, at p. 94, in your last issue, respecting the superiority of these plants over Pelargoniums as summer bedders. The year 1887 will long be remembered as an unusually hot one, when the general floriferousness of the Tuberous Begonia was thought by some to be due to the warm summer; but that cannot be said of the present season, and notwithstanding the heavy rains the Begonias are far superior to the Pelargonium in brightness, indeed they are the brightest beds in our garden at the present time. I have not tried the groundwork for the beds recommended by your correspondent, as we usually plant the Begonias so close together that when they are fully developed the plants cover the ground, and they are liked best when grown in masses. Any one contemplating the bedding out of tuberous Begonias, raised in the usual way, from a packet of mixed seeds, would do well to grow them the first season in the reserve garden, as by so doing plants of uniform growth can be selected. I should feel grateful to any one of the correspondents of the *Gardeners' Chronicle* if they would kindly give me the names of a few of the newer tested free bloomers amongst crimson, scarlet and pink varieties.

I still retain the old Vesuvius, Monarch, Sedeni, &c., on account of their floriferousness. *D. Elkins, Trewherry House, Cirencester.*

**THE POTATO DISEASE.**—As a lady's postscript is said to contain the most important item in her letter, so must the postscript to my recent report on the condition of the Potato crops in this district be of more importance than the report itself, for since that was penned, and especially during the past few days, the ordinary form of disease has shown itself in a rampant state in our Potato breadths, and in all directions, in some cases the leafage being already quite blackened. That such should be the case is hardly to be wondered at, for the downpours of rain are so frequent and so heavy, the sky is so clouded, and the average temperature so low, that the weather conditions are those of November rather than of July. In retentive soils the water has converted the earth into the consistency of brick clay, the tubers extending literally in this way. With such surroundings, there is now too much reason to fear that the Potato disease will this year present itself in its very worst form of Potato rot. *A. Dean, Bedford, July 26.*

**CABBAGES.**—I would like to ask "A. D." in what way Sutton's Early Gem Cabbage differs from Little Pixie? In the summer of 1887 I grew both varieties on the same border, sown and planted on the same day; neither in form, earliness, nor colour, could I detect the slightest difference. As to flavour I will not speak, I have always found Little Pixie A 1 in that respect, but it is essentially a summer or early autumn Cabbage. To stand the winter I prefer Webb's Emperor, a variety that has never failed me. *John Wilkes, Crewell Hall Gardens, Stafford.*

**WHICH IS THE EARLIEST PEA?**—When authorities differ, who shall decide? We gardeners naturally look to the horticultural writers to keep us *au fait* with the best varieties of vegetables required for the different purposes. As one of the old school, I was much disappointed in reading such a meagre account of early Peas in the report of the trial grounds of a large London seed firm by "R. D." I know it used to be a rule among London houses to prove the various kinds in their different classes side by side for comparison, and still believe it to be so. Now the question that naturally arises is, Where are the Ringleader, First Crop, and the thousand and one novelties which have been dinned in our ears for years past as being so much earlier than the old Dillstone's Prolific and Improved Sangster's No. 1? I for one cannot understand how these old varieties should come to the fore again if the descriptions given of the later introductions were correct and true. Surely it must be a mistake to write Veitch's First Early, Harrison's New Early Eclipse, and the other round blue-seeded named, as being forms of Sangster's No. 1. They have always appeared to me different in height, habit, shape of pod, and colour, in every stage of growth; certainly they are of the form, but it is only in the shape of the Pea in its dry state, both being round. Besides, in the catalogue of the firm in question, they are described as being much shorter in the haulm. The writer favours us with the information that the Semitar is a desirable variety, with a tendency to run to a tall type. Is this a new early variety or another version of the lamented death of Queen Anne? If so, it is surely out of place in a report on early Peas. We know it is not always advisable for one firm to push into notoriety the introductions of other firms, and I cannot help thinking the reporter in this instance has withheld some of the most interesting parts of his observations, as there are so many leading varieties in commerce not noted. *An Old Gardener.* [We drew attention to the discrepancy here noted. Ed.]

**THE LIFTING OF DAFFODILS.**—Having read with interest the remarks of Mr. J. Walker and Mr. E. Jenkins on the annual lifting of Daffodils, I would add my mite for the benefit of the readers of the *Gardeners' Chronicle*. Both gentlemen may be right in a certain sense. I fully concur with Mr. W. Burbridge that "the best plan in practice is to find out the best course to pursue in one's soil." No hard and fast lines can be laid down respecting either the planting or lifting of Daffodils—soil, climate, and situation must be taken into consideration; deep planting is by some recommended, but my experience in the Isles of Scilly is to the contrary. We seldom plant deeper than 2 inches, and in some cases not so deep as that. I

consider that but few Daffodils require to be lifted within three years; *N. pallidus* precox and Mary Anderson may be excepted. If flowers be the main object in growing, they would produce a greater quantity of flowers during that time than if lifted annually, and the offsets taken off and planted singly; as the offsets flower sooner by being left on to the parent bulb than by being removed. But if marketable bulbs are required, then I would say lift annually, and remove the offsets. I cannot endorse the statement of Mr. Walker, that for general purposes bulbs and flowers are all the better for being lifted annually; nor can I that of Mr. Jenkins as to leaving in the ground for more than three years *Poeticus ornatus* and *P. plenus*: my experience with these two varieties is that if left for longer than that time the flowers deteriorate, and many are apt to come blind; but I may not be right for all soils and situations. With us the soil is light and the climate mild, so mild that from the open ground we cut Soleil d'Or the first week in January, and other Polyanthus varieties soon follow; in the trumpet section *pallidus precox*, Arct. High, or Irish King and obvallarie the second week in February; and about the latter part of the month Golden Spur, Scoticus, princeps, Henry Irving, variformis, spurius, and several others. *J. C. Tomkin, Isles of Scilly.*

FIG. 15.—CRATE AND BOXES FOR THE TRANSIT OF STRAWBERRIES AND CHERRIES. (SEE P. 130.)

**CARNATIONS.**—The season of the Rose is not at an end, and we have that of the Carnation and its nearly ally, the Picotee, upon us; but the flowers we observe on the stands at special exhibitions of that flower are not the flowers of our borders or the cottage garden, but the produce of plants grown in pots from first to last. The flowers are very pretty, very refined, the colours regularly distributed over the flower, and the form rendered still more so by the art of the exhibitor: but the "cut and come again" plants in the border of stout Clove Carnations—selfs like Alice Ann Mary, Dandy Dinmont, Dora, J. Arthur Wellington, and Mrs. Huson Morris, or fancies, like Adonis, Satellite, Touchstone, and Mrs. Champneys—scarlet biazres, pink and purple biazres, and flakes in purple, scarlet, and rose—are flowers which every one should grow, and in quantity. The Picotee is a weaker-growing plant in some soils than is the Carnation, but by proper attention to drainage and to giving them and the Carnation also a warm position, the former will grow quite satisfactorily. Warmth and thorough drainage at the root being essentials is one reason that the florists grow their show flowers on plants in pots.

The Italians and Tyrolese, who are great admirers of the selfs, especially of selfs of the crimson and red shades, which assort so well with their rich red-brown skin tints, grow the Carnation in its windows and balconies, and the flower in its season can be found in cottage and villa alike. But in one respect they widely differ in their manner of treatment—they do not try to make the flower-stems, which naturally droop as the flower-buds get heavier, stand upright by means of sticks, as we in our stupidity do, but they let the flowers fall about in *negligée* profusion, hanging over the sides of the quaint pots and below the window sill. Let our gardeners try their hand at growing the plants in quantity in pots for window-boxes and open-air stages, employing only vigorous growers and those with powerful perfume, and their employers will greatly appreciate their endeavours. *M. W.*

**BROCCOLI GILBERT'S VICTORIA.**—I can assure your correspondent "J. H." that the reason I did not again refer to this variety was not in the least owing to disappointment, as the opposite was the case. The breadth of plants which I mention in my notes, *Gardeners' Chronicle*, June 9 last, as looking so very promising not only turned in well, but supplied us with fine heads fully a fortnight after all others were finished. The lateness, and very mild flavour of the Victoria, are favourable points. This Broccoli and Dean's Snowball Cauliflower have filled up what would have been a long break in the supply of these vegetables. Of the latter I made a sowing in heat early in March, planting out in the quarters in April. The weather was not favourable to growth, but notwithstanding the heads turned in well, supplying us with beautifully compact white heads, not large, but firm. Another excellent point in favour of this variety is that, owing to its making but little leafage, it may be very closely planted: not more than a foot apart is quite sufficient. *H. Markham.*

**DISEASE OF ORNITHOGALUM.**—Re the Ornithogalum fungus, figured some time since, a peculiar feature should be recorded, that is, that the leaves only are affected. After they have been quite destroyed the flower-scapes develop in a perfect manner. So far as I have seen, only *O. nutans* is affected by it. *T. Smith, Daisy Hill Nursery.* [This disease, as caused by *Heterosporium ornithogali* (see *Gardeners' Chronicle*, May 26, 1888, p. 658, and June 23, 1888, p. 781) is, as a correspondent informs us, confined to the leaves. At least, it is so in our correspondent's case, for he informs us that after the leaves "have been quite destroyed the flower-scapes develop in a perfect manner." *W. G. S.*]

## SOCIETIES.

### ROYAL HORTICULTURAL.

#### Scientific Committee.

JULY 24.—Dr. H. Scott in the chair. Present: Messrs. Pascoe, W. G. Smith, G. F. Wilson, J. O'Brien, D. Morris, Dr. Hogg, and Dr. Masters.

*Heterocism in Fungi.*—Mr. Plowright, in acknowledging the letter of thanks addressed to him some time since by the chairman, on behalf of the committee, made the following remarks:—"It was my hope when I began my cultures that the general outcome would tend to a lessening of the number of the species of the Uredineae. This, however, is not the case; on the contrary, I feel convinced that physiological investigation will show that these parasitic fungi are much more numerous than we at present imagine. To take one instance only, that of the Uromyces, which occurs upon Beans. It is now generally thought that one species is common to most of the Leguminosae. I have made a number of cultures on this point, and find that when *U. fabae* from the common Bean haulms is placed on young plants of Bean, Pea, Vicia cracca, V. sativa, Lathyrus pratensis, and Ervum hirsutum, *Aecidia* are only produced on the Bean and Pea; and further, that the Uromyces on *Ervum hirsutum* applied to the same host plants produced its *Aecidium* on *Ervum* only. In the same way the *Puccinia* which occurs upon the Compositae, I find, not one species, as is generally supposed, but that *Uredosporae* from *Centaurea nigra*, for instance, will not affect *Taraxacum officinale*, neither will the *Uredosporae* of *T. officinale* infect *Apargia autumnalis* nor *Lapsana communis*. Before the true affinities of these species can be satisfactorily determined numerous and long-

continued biological investigations will have to be made for the hasty grouping together of the various forms, because they occur on allied host plants, is as liable to error as the opposite plan of making every form a species because it occurs on a different host plant."

**Malformed *Cypripediums*.**—Dr. Masters exhibited drawings and made comments on several malformed *Cypripediums* which had been referred to him at a previous meeting. The principal peculiarities, in different flowers, were the following:—imperfect development of the lip; adhesion of the lateral petals to the sides of the column, and consequent displacement; disjunction of the lateral sepals, and presence of two lips in one flower. The adventitious lip might be the result (a) of additional development, (b) of subdivisions of the primary lip, (c) of the presence in the guise of a lip of one of the outer stamens (A 2), which is usually suppressed. Another flower had three stamens, one corresponding to A 1, and two lateral ones as usual, the stigma being distinctly three-lobed. From Mr. Kimball came a drawing of *C. Lawrenceanum*, in which the parts of the flower were arranged in crossed pairs. The most peculiar flower was one of *C. barbatum* exhibited by Mr. O'Brien. In this the general form was triangular, the upper sepal was wanting, the two lateral ones were present, the two lateral petals were also present, but in the shape of broadly ovate segments, more like sepals in shape, but having the position of petals, as well as the little tufts of hairs on the margins, characteristic of the petals in this species. The column was erect with two lateral shields concealing the anthers, while the ordinary median staminode was absent. The style was erect, cylindric, scarcely lobed at the top, and the ovary entirely absent.

***Passiflora kewensis*.**—X.—Dr. Masters showed drawings of this hybrid, as also of *P. hybrida floribunda*, to show how closely similar they were. *P. kewensis* X was known to be a hybrid out of *P. kermesina* by cerulea, and *P. hybrida floribunda* in all probability had the same origin.

**Movements in the Shoots of Firs.**—Dr. Masters showed diagrams representing the movements, not only of the leader shoot of *Abies bifida* (fir), but also of the lateral shoots, and explained that while the leader shoot gyrates in irregular ellipses, its point being alternately raised or depressed, the lateral shoots not only move from one point of the compass to another, and are elevated or depressed, but are also rotated on their own axis, the leaves likewise being raised or depressed at various angles. These movements of shoots and leaves were very complex, and in all probability dependent on different causes.

**Growth of *Philadelphus*.**—Dr. Masters exhibited a drawing of a plant of *Philadelphus* raised from a cutting in a pot. On shifting the cutting into a larger-sized pot, it was found that a dense leath of roots had proceeded from one single point only of the callused end—not from the entire circumference. One lateral shoot only was, in the first instance, produced from the side of the cutting, and this shoot was on the opposite side to that whence the tufts of roots issued. Not till this one shoot had grown to a large size, and produced three or four pairs of leaves with internodes of considerable length between them, was a second shoot produced. From the base of the original cutting, opposite to the first, a third and a fourth were also produced regularly, first on one side, then on the other side of the plant, and nowhere else.

***Aracaria brasiliensis*.**—Professor Henriques, of Coimbra, sent a photograph showing two fine trees of this species growing in the open air in the Botanic Gardens of the University of that city.

**The Plymouth Strawberry.**—Dr. Masters showed ripe fruits of this curious monstrosity, grown from plants presented to him by Mr. G. F. Wilson. It is an alpine Strawberry, in which all the parts of the flower are more or less represented by leaves. The plant was mentioned by old botanical writers, but afterwards disappeared, or was so completely overlooked that its very existence was assumed to be a myth. Of late years, however, the plant had reappeared in several gardens, and the correctness of the old writers has been vindicated.

***Hybrid Clematis*.**—From Mr. Noble came specimens of his *C. Jackmanni* alba. The ordinary Jackman Clematis produces its purple flowers in late summer on the young wood of the year. The white variety, however, produces flowers in the spring on the old wood of the preceding year, and which are more or less irregular in character, and again flowers on the herbaceous shoots later in the summer, thus showing in one and the same plant the characteristics of two

distinct sections of the genus, and affording evidence of the hybrid origin of the plant in question.

**Stag Beetle.**—From Mr. Rouppell came a specimen of *Lucanus cervus*, stated to be very abundant this season in certain localities. While the perfect insect, in spite of its formidable appearance, is harmless to plants, its larva is very destructive to the wood of trees.

### Trials at Chiswick.

A MEETING of the Fruit and Vegetable Committee was held at Chiswick on July 26. Present:—Harry J. Veitch, Esq., in the chair; Messrs. Lee, Warren, Pearson, Ross, Rivers, Marshall, Norman, and Denning.

The collection of Peas growing in the garden was further examined. Mr. Hogg, from Messrs. J. Veitch & Sons, was noted as a very fine stock. Midsummer Green was condemned as worthless. Optimum (Laxton), a tall green Marrow, having large handsome pods resembling Telegraph, was approved. Prince of Wales was noted for its extraordinary cropping qualities. Pride of Kent (Divers) and Gloria Mundi (Yates) were considered to be *Ne Plus Ultra*. The Abbot (Hurst & Son), a wrinkled green Marrow resembling Telegraph in appearance, but of superior quality, was greatly approved, and received a First-class Certificate. Reliable (Laxton), a dwarf green wrinkled Marrow of the Scimitar type, was approved for its free cropping qualities and well filled pods. Empress (Eckford), a tall green wrinkled Marrow, was approved as a good cropper and of good quality. *Ne Plus Ultra* Seedling (Culverwell) was considered a good stock of the old variety.

A collection of autumn-sown Onions was inspected, the various types and selections of White Spanish, autumn-sown, were noted as superior to the Tripoli section this season. Bailey's selected White Spanish (Veitch) was highly commended by the committee, being considered the best selection.

Tomatoes were inspected. Messrs. J. Veitch & Sons submitted examples of Raspberry Superlative, referred from the meeting at Westminster, together with examples of Lord Beaconsfield and Semper Fidelis for comparison. They were considered quite distinct. Superlative, being far superior, was awarded a First-class Certificate.

Mr. T. F. Rivers submitted examples of a seedling Peach and Nectarine raised from the Nectarine Peach. The Nectarine was remarkable for its enormous size, being 10½ inches in circumference, and 10 oz. in weight.

### NORTHAMPTONSHIRE HORTICULTURAL, NORTHAMPTON.

NORTHAMPTON, JULY 19 AND 20.—The above Society's show was held on land adjoining the show-ground of the County Agricultural Association, and was in every respect an excellent all-round exhibition, the liberal prizes judiciously offered in the chief classes being an inducement to exhibitors living at considerable distance from the town to compete.

For twelve stove or greenhouse plants, six in bloom and six fine-foliage, Mr. Cypher, of Cheltenham, staged a beautiful lot of plants, notably those in flower, which consisted of *Erica depressa*, as fresh as in May, and most densely bloomed—probably as fine an example as has ever been staged; *Erica Parmentieri* roses, also in fine condition; a huge plant of *Phorocoma prolifera* Barnesii, in splendid health and profuse bloom; *Exonia salicifolia*, now seldom seen, was equally well done; these, with excellent plants of *Stephanotis floribunda* and *Allamanda nobilis*, were all in Mr. Cypher's best form. The foliage plants consisted of *Crotons*, *Palms*, and a fine example of *Cordyline indivisa*. The 2nd prize went to twelve capital plants from Mr. Wm. Finch, gr. to Jas. Marriot, Esq., of Coventry, who had a very fine plant of *Croton mortifortensis* splendidly coloured. Groups of plants, 20 feet by 12 each, were a most attractive feature, and were so arranged as to fill the central space of a marquee set apart for them. This is an excellent system of arrangement, as it affords scope for variety of arrangement.

Mr. Parker, of Rugby, was to the front with a very light and tasteful group, the central portion of which could hardly be surpassed either in choice of material or design; well-grown plants of *Cocos Weddelliana* here played a most important part, associated with *Eulalia japonica* variegata and white Lilies; flowering plants in season were fully em-

ployed, without too much reliance being placed on choice exotics. Mr. A. Webb, gr. to J. H. M. Sutton, Esq., Kelham Hall, Newark, was 2nd, his group showing considerable taste in its design—the addition of slightly more colour to enliven it would have given a better finish. Mr. Cypher was 3rd, with a choice lot of plants, prominent among which were several *Orchids*; a few more plants of light growth would have added to the effect of this group.

A similar class for groups, but limited to places within thirty miles of Northampton, was also well filled with exhibits. With the same limitation, Mr. Finch gained the 1st position with ten stove or greenhouse plants showing well-grown specimens of medium size. The same exhibitor also took the 1st in the previously mentioned group class. The classes provided for exotic Ferns were well filled, as were also others for *Begonias*, zonal *Pelargoniums*, &c.

Among cut flowers the dinner-table decorations by Mr. Cypher formed a prominent feature, and which secured for him an easy victory over Mr. Parker, whilst Messrs. Perkins, of Coventry, won the 1st prize with a bouquet of tasteful design. Cut flowers of hardy herbaceous plants were shown in fine condition. Mr. Goldsmith, gr. to Sir E. Loder, Bart., Floore House, Weedon, was 1st, with a collection which consisted of the best things in bloom, and those staged in an admirable manner. The competitors in the classes of stove and greenhouse cut flowers would do well to imitate on a future occasion Mr. Goldsmith's style in arranging their exhibits.

Messrs. Perkins exhibited Roses in classes for twenty-four and twelve respectively, gaining 1st in each instance.

The fruit classes were fairly well filled, two strong collections of almost equal merit being staged in the open class provided for eight distinct kinds, and came from Mr. Blair, gr. to the Duke of Westminster, at Trentham; and Mr. Edmonds, gr. to the Duke of St. Alban's, Bestwood; the first-named had a fine fruit of Queen Pine, Duke of Buccleuch Grapes, and a good Melon, an extra fine dish of Plums, with Peaches and Nectarines of more than average quality. Mr. Edmonds was strong in black Grapes, Peaches, and Nectarines, showing also a good Melon, but was weak with his Pine-apple.

Mr. Goldsmith showed well in other fruit classes, taking 1st for Peaches, Nectarines, Cherries, and Strawberries, the latter being very fine fruit of James Veitch.

Mr. Birch, gr. to the Marquis of Northampton, Castle Ashby, was 1st, with some fine bunches of Black Hamburgh Grapes, and in the class for one Melon.

Collections of vegetables were staged in admirable condition by Mr. Robinson, gr. to T. Howard, Esq., Bedford, who was 1st for twelve kinds; and Mr. Underwood, gr. to J. S. Bouvier, Esq., Delapré Abbey, for eight; whilst in a special class, the prizes being offered by Messrs. Sutton & Sons, Reading, Mr. Goldsmith took a similar position. The cottagers' products at the Northampton show are invariably good, and this occasion was no exception to the rule.

Superintendents of flower shows please note. At the recent Northampton show the judges were able to commence their duties at 10 o'clock by a judicious arrangement on the part of the committee, who insisted that one tent should be cleared at that hour, and so on with the others in rotation. The work of judging was thus far easier, and was completed well within time. H.

### BISHOP'S WALTHAM HORTICULTURAL.

THE annual exhibition of this Society took place on the 25th ult. in Swanmore Park, the seat of W. H. Myers, Esq., whose gardener, Mr. E. Molyneux, has gained much renown as a Chrysanthemum exhibitor.

The show, which was unfortunately held on a very rainy day, consisted chiefly of cottagers' exhibits of vegetables, and if Potatoes be excepted, all were exceptionally fine for the season. Carrots, Turnips, Onions and Peas were excellent, the varieties shown most largely being the Early Nantes Carrot, Six-week Turnips, Reading Onions, and Duke of Albany Pea. The show was fixed at too early a date for Potatoes, and they were poor indeed. Small fruits were of good quality. Many of the dishes of Black Currants approached in size the berries of a West's St. Peter's Grape, and there must be some ingredient in the soil of the district peculiarly suitable to this fruit.

As regards flowers, the feature of the show was

undoubtedly the collection of six, twelve, and eighteen varieties of hardy cut flowers, the cottagers' exhibits in these classes being quite on a par with those of the amateur and gentlemen's gardeners, a fact due in no small degree to the example set of growing them largely in the Swanmore Gardens, and also by the offer of special prizes by Mr. Myers. I give the names of the most successful stand of eighteen varieties, sent by Mr. Chequer, gr. to Mrs. Franklyn, Sheddfield Lodge; they were—*Achillea millefolium rubrum*, *Agrostemma Flos-Jovis*, *Campanula persicifolia alba fl.-pl.*, *Coronilla varia*, *Delphinium altissimum*, *Gaillardia grandiflora*, *Galega officinalis alba*, *Lathyrus latifolius alba*, *Lilium croceum*, *Linaria asaroides splendens*, *Lychnis chalcedonica*, *Monarda didyma*, *Pentstemon barbatus*, *Statice species*, *Silene aemula*, *Stenactis speciosa*, *Veronica spicata alba*, *Yucca gloriosa*.

Table decorations were on the whole good; particularly so was that composed of wild flowers from Miss M. Wilson, which obtained the 1st prize, Mrs. Mellicott, of the Vicarage, Swanmore, being a good 2nd.

## SCOTLAND.

### THE SCOTTISH HORTICULTURAL ASSOCIATION AND THE ROYAL BOTANIC GARDENS, EDINBURGH.

AN extraordinary meeting of the above Association was held in the Queen Street Hall, Edinburgh, on Thursday, the 26th ult., to protest against the transference of the Botanic Garden from the Crown to the University, as proposed in the Universities (Scotland) Bill. Mr. John Methven, of Thomas Methven & Sons, occupied the chair, and, in addition to a strong and representative muster of members of the Association, there were present Bailie Turnbull, Councillors Robertson, Ritchie, Macpherson, and Anderson, Convenor White, Dr. Craig, President of the Edinburgh Botanical Society, and Dr. Paterson, Bridge of Allan.

The Chairman, in opening the meeting, disclaimed on his own part and that of the Association any hostility to the Universities Bill as a Bill. The measure would, no doubt, be beneficial to the Universities of Scotland; but the several clauses in it proposing the transference of the Botanic Gardens from the Crown to the University of Edinburgh could not but be injurious to horticulture in Scotland. It was simply the handing over of an important public institution from a public and responsible body to a private and irresponsible body. The public, in the event of the transference clauses of the bill being carried, would have no power to influence the administration and maintenance of the gardens, and this he considered would be deplorable in the interests of horticulture and the public generally.

Mr. Malcolm Dunn, The Gardens, Dalkeith, moved — "That this meeting views with alarm the proposal in the Universities (Scotland) Bill, transferring the Royal Botanic Gardens from the Crown to the University of Edinburgh, and protests, in the interests of horticulture in Scotland, against the proposal." Nothing, he thought, could be more fraught with harm to the efficiency and usefulness of the gardens than to disestablish them, as was proposed by this bill. The gardens were the centre and the source of all the scientific branches of gardening. It would, he considered, be a lamentable loss to the community at large, and particularly to horticulturists, if the management of the gardens were limited only to the providing for the requirements of medical students, and he hoped the time would never come when none but these students would be allowed to enter these gardens, and avail themselves of the rich resources of information they contained under the present management.

Mr. Alex. Mackenzie, Warriston Nursery, seconded the resolution, and expatiated with much force on the benefits conferred on horticulture during the past thirty years by the gardens.

Bailie Turnbull spoke in support of the resolution on public grounds, and deplored the proposal to deprive the public of Edinburgh of its finest outdoors resort.

Dr. Paterson, speaking as an old graduate of the University, held that it would be an additional burden to that institution without any compensating advantages were the contemplated change carried out; and looking upon the matter as of national importance, called upon every Scotsman to protest against the transference.

Dr. Craig pointed out that no one interested wanted the proposed change except the Government, and they had failed to give any reason for the proposal. The authorities of the University viewed the proposal with alarm, and had protested against it, so also had the Corporation of Edinburgh. He assumed that economy was at the bottom of it, and if this were so Government should frankly say so.

Mr. A. D. Mackenzie, Edinburgh, moved — "That this meeting petition Parliament against the transference clauses in the bill, and authorise the Secretary to forward the petition to the member for the Western Division of Edinburgh for presentation to Parliament." Were the gardens handed over to the University, he said, without adequate provision for their proper maintenance, a fraud would be committed by the Government on the public.

Mr. Matthew Todd, in seconding the resolution, said that Professor Bayley-Balfour had well expressed the effect of the change by the terms "transference meant arrest," when speaking in his inaugural address of the efficiency and expansiveness that should be provided for in the future administration of the gardens, and held that if there were no progress there must be declension.

Mr. Andrew Taylor supported the motion, and said that the gardens could not be exclusively given over to the University, because they were, out-and-out, national property, and they ought to be kept open as a distinct national institution.

Both the resolutions were unanimously adopted, and a vote of thanks to the Chairman brought the meeting to a close.

### ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

The thirty-fifth annual general meeting of the Royal Scottish Arboricultural Society will, by the kind permission of the Regius Keeper, Professor Bayley-Balfour, be held in the class-room at the Royal Botanic Gardens, Inverleith Row, Edinburgh, on Tuesday, August 7, at 11 A.M.

The Council have arranged that, immediately after the meeting terminates, members who may be desirous to do so, will have the opportunity afforded them of inspecting the Arboretum and Inverleith Nurseries.

The annual dinner will be held in the "Waterloo" Hotel, Waterloo Place, on Tuesday, August 7, at 6 P.M. The Council of the Society have arranged with the committee in charge of the "Dr. Hugh-Cleghorn" testimonial, that the presentation be made to Dr. Cleghorn at the dinner.

**Annual Excursion.**—The eleventh annual excursion of the Society will take place, by the kind permission of the proprietors, to several estates in Roxburghshire, on August 8 and 9.

**Ballot List, August 7.**—The names of the proposed new office-bearers (recommended by the Council) are printed in *italics*; those who retire by rotation are marked by an asterisk.

**President.**—*The Right Hon. the Earl of Hopetoun, Hopetoun House, Linlithgowshire.*

**Vice-Presidents.**—\*Hugh Cleghorn, M.D., LL.D., F.R.S.E., of Strathvie, St. Andrews; Malcolm Dunn, The Palace Gardens, Dalkeith; the Right Hon. Lord Balfour of Burleigh, Kennet House, Alloa; William McCorquodale, Forester and Wood Surveyor, Scone, Perth; D. F. Mackenzie, Factor, Merton Hall, Liberton; Hugh Cleghorn, M.D., LL.D., F.R.S.E., of Strathvie, St. Andrews.

**Council.**—\*John M'Laren, Inspector and Valuer of Woods, Hawthornvale, Winchburgh; \*D. F. Mackenzie, Factor, Morton Hall, Liberton; \*James Watt, J.P. (of Messrs. Little & Ballantyne), Nurseryman, Carlisle; \*John Lamont, Nurseryman and Seedsman, Edinburgh; \*Charles Buchanan, Overseer, Penicuik House, Penicuik; Robert Lindsay, Curator, Royal Botanic Garden, Edinburgh; John Methven (of Messrs. T. Methven & Sons), Nurseryman

and Seedsman, Edinburgh; Robert Hutchison F.R.S.E., of Carlowie, 29, Chester Street, Edinburgh; James Robertson, Wood Manager, Panmure, Carnoustie; Andrew Slater, Overseer, Hayston, Peebles; Robert Baxter, Forester, Dalkeith Park, Dalkeith; John T. M'Laren, Overseer, Kennet, Alloa; Thomas Wilkie, Forester, Ladywell, Dunkeld; Daniel Dewar, Forester, Tynninghame, Prestonkirk; John M'Laren, Inspector and Valuer of Woods, Hawthornvale, Winchburgh; Charles Buchanan, Overseer, Penicuik House, Penicuik; James Alexander (of Messrs. Dicksons & Co.), 1, Waterloo Place, Edinburgh; John Allan, Forester, Dalmeny Park, Edinburgh; James Cook, Land Steward, Arnsfoot, Gorbidge.

**Secretary and Treasurer.**—William J. Moffat, 5, St. Andrew Square, Edinburgh.

**Auditor.**—John Ord Mackenzie, of Dolphinton, W.S., 9, Hill Street, Edinburgh.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees — i.e. "Day-degrees," signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending July 30, is furnished from the Meteorological Office:—

"The weather has continued in a very unsettled and changeable state, with heavy falls of rain at nearly all the Irish and English stations, and severe local thunderstorms."

"The temperature has remained considerably below the mean, the deficit ranging from 2° in 'England, S.,' 'Scotland, W.,' and the 'Channel Islands,' to 5° in the 'Midland Counties.' The highest temperatures were, as a rule, registered either on the 24th or 25th, when the thermometer rose to 67° or 68° in the 'Grazing districts,' and to between 69° and 72° in the 'Wheat-producing' districts. Towards the close of the week the maximum readings were below 60° in all the more northern parts of the kingdom. The lowest temperatures which were recorded on irregular dates ranged from 37° in 'Scotland, E.,' and 39° in 'Scotland, N.,' to 48° in 'England, S.,' and 'England, S.W.,' and 52° in the 'Channel Islands.'"

"The rainfall has been largely in excess of the mean in all districts, excepting 'Scotland, N.,' and 'Scotland, E.,' where a slight deficit is reported. In Ireland and the east of England the aggregate for the week amounted to as much as three times the normal, and at Durham, during thunderstorms which occurred on the 25th and 26th, the total amount collected was no less than 3.75 inches."

"Bright sunshine has again been very deficient, the percentages of the possible amount ranging from between 16 and 18 over the southern parts of our islands to 29 in 'England, E.,' and 32 in 'Ireland, S.'"

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

\* Will Mr. Long, who gave the address, The Newark, Leicester, send his correct address, as a letter forwarded to him was returned, marked "Not known."

CUCUMBERS: P. G. H. Send specimens of the roots; the symptoms are those of the rootworm disease.

FUNGUS: T. D., Darlington. Fairy-ring Champignon (*Marasmius oreades*); one of the edible series.

GRAPE VINE: I. H. A recipe for making Rhubarb wine was given on p. 664 of last volume; the same answers equally well for Grapes.

GARDEN PRIMULAS DISEASED: T. Smith. A correspondent forwards specimens of *Primula Fackinii* badly infested with the fungus known as *Trichobasis* (= *Uromyces*) *primulae*. The diseased examples should be destroyed at once, otherwise the fungus will not only destroy the Primulas, but will reproduce itself and prepare for a future attack.

NAMES OF PLANTS: J. Drury. *Santolina incana*.—H. B. *Hyoscyamus niger*.—Reader. 1, *Polygonum persicaria*, perhaps; 2, not determinable; 3, perhaps *Chenopodium album*. All wretched scraps; send better specimens.—Wheeler & Co. Dried leaf looks like the Logquat (*Eriobotrya japonica*). We cannot be sure of the Pine from the leaves sent. It looks like *P. taeda*.—F. I. I. *Ceanothus azureus*; 2, *Malva moschata*, white variety.—J. C. *Trachelium coraeum*.—G. B. 1, *Galium verum*; 2, *Rubus odoratus*; 3, *Achillea*

*ptarmica fl.-pl.*; 4, *Polystichum aculeatum*; 5, *Aspidium dilatatum*; 6, *Athyrium Filix femina*.—G. O. R. 1, *Funkia Sieboldiana*; 2, *Spiraea Ulmaria*; 3, *Malva moschata*, white flower; 4, *Achillea Ptarmica*, fl.-pl.; 5, *Campanula rapunculoides*; 6, *Phlomis fruticosa*; 7, *Agrostemma coronaria*; 8, *Antennaria margaritacea*; 9, *Polygonum affine*.—E. T. *Lilium Scarlet Martagon*; *Achillea Ptarmica*, fl.-pl. —T. C. H. The specimen was much withered; please send again, and pack in damp moss. —W. B. 1, *Lastrea Filix-mas cristata*; 2, *Athyrium Filix-femina*, crested var.; 3, *Lastrea Filix-mas polydactyla*; 4, *Lysimachia ephemerum* (not a *Veronica*).—D. *Geranium pratense*, double var. —G. W. R. *Sarcanthus Bucephalus*.—P. K. *Stanhopea Bucephalus*; *Hemerocallis fulva*.—A. B. 1, *Veronica ligustrifolia*; 2, *Veronica Andersoni*; 3, *Hieracium aurantiacum*; 4, *Santolina chamaecypariss*; 5, *Campanula isophylla* (probably); 6, *Lysimachia nummularia*.

PANDANTUS UTILIS: *Pandanus*. Small offsets which grow out from the stem and around the collar of the plant; if taken off with a slight heel and inserted into a pot of sandy loam surfaced with silver-sand, and placed in a propagating pit or hot-bed (if in the former a bell-glass must be used) will, with care, root in five or six weeks. Larger portions of the head may be layered into small boxes of earth, supported by stakes in a suitable position, before layering making an incision, as is done with Carnations when layered, and putting in a thin wedge of bone or hard wood to keep the slit open.

INSECTS: J. W. A well-known pest, *Adelges abietis* (fig. 16).

FIG. 16.—ADELGES ABIEIS: CAUSING GALLS ON SPRUCE FIR.

PARASITE ON ERICA: H. L. & Co. A Dodder (*Cuscuta*). Comes in the peat.

SAW-FLY: J. J. F. If the flies only are as yet found on the trees, try washing with water strongly impregnated with Hellebore powder; strong tobacco-water solution to which soft-soap, at the rate of 2 oz. to the gallon has been added, and with soot-water repeatedly applied, the fly itself will be destroyed. The larvæ of the saw-fly, usually called the slugworm, can be destroyed by dusting the infested trees with Hellebore powder. The cocoons of the fly are deposited in the soil at the foot of the trees, and should, after an attack, be either lightly pricked over to a depth of 4 inches, working some quicklime into it, or taken away and charred.

SCALE ON CAMELLIAS: *Pandanus*. Mere syringings with petroleum would have no effect unless used of dangerous strength. Seal-oil might be employed on the old wood, but not on that which is young, nor on the leaves. Gishurst Compound—a soap obtainable at the nurseries—or methylated spirits might be employed, using the wash with a hard brush to dislodge the insects.

SEEDLING ACUCURAS: J. J. S. Yes, fine varieties. TOMATO DISEASE: Bennett. One of the many forms of fungi affecting the Tomato often referred to. See back numbers, and burn the plants.

VINE LEAVES: Alice McLennan. 1. Has warts over the surface induced by an excessively moist state

of the internal air of the vinery, and too little ventilation; such conditions causing also the growth of aerial roots sometimes observed on Vines. 2. Shows outgrowths from the leaf similar to those found on Carled Kale, &c. They do no harm, and are caused mainly by the vigour of the Vine finding but small outlet in the few bunches borne at the top of the cane. Were the crop a good one, it is probable that the foliage would have been in its normal state.

WILD PLANTS: G. B. Bentham's *British Botany* (Reeve & Co.)

## CATALOGUES RECEIVED.

LUCOMBE, PINGE & Co., Exeter Nursery, Exeter—Bulbs and Roses.

J. R. Box, East Surrey Seed Warehouse, Croydon—Bulbs.

DAMIAN & Co., San Giovanni a Teduccio, near Naples, Italy—Bulbs, Roots and Orchids.

COMMUNICATIONS RECEIVED.—W. Ridgway.—C. W. D.—M. F.—J. Barron.—O. King.—E. H. J.—G.—W. S.—C. S.—H. T. K.—J. Cameron (we do not contemplate publishing Jan.).—F. M.—W. G.—A. D.—M. Sider.—R. D.—D. J. Y.—W. H.—J. W. J. Y. J., Madeira.—J. G. B.—G. M.—D. W. Fole.—C. W. D.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

## MARKETS.

## COWLEY GARDEN, August 2.

MARKET still heavily supplied, with scarcely any alteration in prices. James Webber, Wholesale Apple Market.

Lemons, per case	12 0-21 0	Strawberries, lb.	0 6-1 0

## SEEDS.

LONDON: August 1.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that owing to the continued wet weather there is increasing firmness in the seed trade. All descriptions of Alsike, white and Trefoil are consequently held with great strength. In imported Italian there has also been a substantial advance. For Canary and Hemp seed the sale is slow. Higher prices are now asked for Blue Peas, Mustard and Rape seed realise late quotations. Feeding Linseed is firm.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended July 28:—Wheat, 32s. 6d.; Barley, 25s. 1d.; Oats, 17s. For the corresponding week in 1887:—Wheat, 34s. 5d.; Barley, 21s. 6d.; Oats, 17s. 1d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: August 1.—Supplies of fruit good; of English Potatoes, fair; of Jersey, St. Malo, and Cherbourg Potatoes, short. Trade is not quite so active. Prices:—Foreign Peas, 2s. to 2s. 3d. per bushel of about 24 lb.; foreign Green Gages, 2s. 6d. to 3s. per bushel of 18 lb.; black Currants, 3s. to 3s. 3d. per half sieve; red Currants 2s. 3d. to 2s. 6d. do.; white Currants, 3s. do.; Cherries, 2s. to 3s. 3d. do.; Gooseberries, 2s. to 2s. 6d. do.; Strawberries, 1s. 6d. to 2s. 6d. per peck; Raspberries, 2d. to 4d. per 1 lb. punnet; ditto, 18s. per cwt.; English Tomatoes, 3s. 6d. to 4s. per peck; foreign do., 1s. 9d. to 2s. 6d. per box; Vegetable Marrows, 1s. 6d. to 2s. per dozen; Cabbages, 9d. to 2s. 6d. per tally; Peas, 1s. 6d. to 2s. 6d. per bushel; do., in sacks, 3s. to 4s. per sack; Broad Beans, 1s. 3d. to 1s. 6d. per bushel; do., in sacks, 2s. 3s. per sack; Beetroot, Runners, 7s. to 8s. per sieve; foreign do., 6s. 6d. to 7s. 6d. per box of about 130 lb.; frame Cucumbers, 2s. to 3s. per dozen; Endive, 1s. to 1s. 6d. do.; Cos Lettuce, 6d. per score of 22; Beetroot, 6d. to 8d. per dozen; English Walnuts (for pickling), 2s. to 2s. 3d. per half sieve.

STRATFORD: July 31.—Supply has been good during the past week, and fair trade was done at the following prices:—Cabbages, 3s. to 4s. per tally; Mangels, 18s. to 22s. per ton; Watercress, 6d. to 8d. per dozen bunches; Gooseberries, 4s. to 5s. per flat; do. 2s. to 3s. per half bushel; Peas, 3s. 6d. to 5s. per bag; black Cherries, 3s. to 3s. 6d. per half sieve; white, 4s. do.; Tomatoes, Jerseys, 5d. to 6d. per lb.; Apples, 8s. to 10s. per case; Currants, black, 3s. 6d. to 4s. per half sieve; do., red, 3s. to 3s. 6d. do.

## POTATOS.

BOROUGH AND SPITALFIELDS: July 31.—Supplies are quite sufficient for demand, which is dull. —Shaws, 60s. to 70s.; Hebrons, 70s. to 90s.; kidneys, 80s. to 100s. per ton.

SPITALFIELDS: August 1.—Quotations:—English kidneys, 4s. to 4s. 6d.; Beauty of Hebron, 3s. 6d. to 4s. 6d.; Early Roses, 3s. 6d. to 4s.; Jersey kidneys, 4s. 6d. to 5s. 6d.; do. flukes, 4s. 6d. to 5s. 6d.; St. Malo rounds, 3s. to 3s. 6d.; do. flukes, 3s. 9d. to 4s. 6d.; Lisbon rounds, 3s. 6d. to 4s.; Cherbourg do., 3s. to 3s. 6d.; do. flukes, 4s. 6d. to 5s. 6d. per cwt.

STRATFORD: July 31.—Quotations:—English kidneys, 90s. to 110s.; Beauty of Hebron, 70s. to 90s.; Early Rose, 70s. to 80s. per ton.

Imports.—The imports into London last week consisted of 3137 packages from Jersey, 2 boxes from Malta, and 754 boxes from Cherbourg.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 98s. to 135s.; inferior, 76s. to 86s.; hay, prime, 94s. to 126s.; inferior, 76s. to 84s.; and straw, 26s. to 46s. per load.

## ORCHIDS.

THE UNDERSIGNED, Sole Agent for the United Kingdom, for CARLOS TRAVASSOS, Rio de Janeiro, begs to announce to the Trade generally, that he is open to Receive Orders for every description of Brazilian Orchids. For CATALOGUES, terms, &c., please address,

A. H. GRIMS DITCH,  
5, CLAYTON SQUARE, LIVERPOOL.

Black Currant.—Buddenburg's Black Prince. HAYWARD, The Nurseries, Cheadle, Cheshire, is now Booking Orders for this extraordinary fruit for Autumn delivery. The finest black Currant in cultivation. 12 berries weighing 1oz. Send three stamps for a sample of fruit. Young healthy trees, three sizes, 2s., 4s., and 6s. per dozen.

PRIMULAS—PRIMULAS—PRIMULAS.—Grand Premier Prize and Covent Garden strains. Fine large trusses, beautifully fringed flowers, and new colours. Good Plants, to bloom well, per dozen, 1s. 3d.; extra strong, 1s. 6d.; per 100, 9s. carriage free.

CINERARIAS—CINERARIAS.—Bull's and Cannell's celebrated Prize Strains, and most brilliant colours. Cannot be excelled. Good Plants to bloom well, per 1s. 3d.; extra strong, 1s. 6d.; per 100, 9s. All carriage free.

80,000 CLEMATIS, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple, for climbing and bedding, from 12s. to 24s. per dozen strong plants; extra strong plants, repotted into 5½-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

CUTBUSH'S MILL-TRUCK MUSHROOM SPAWN.—Too well known to require description. Price, 6s. per bushel (1s. extra per bushel for cartage), or 9d. per cake; try by parcel post, 1s. **SPHINCTER GRIP GARDEN HOSE.**

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured.

Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

Used in the CRYSTAL PALACE GARDENS, the ROYAL GARDENS, KEW, and other Public and Private Gardens.  
 Mr. W. G. HEAD, Superintendent of the Crystal Palace Gardens, says:—"We were so satisfied with your Weed Killer and its price, that we have used it absolutely. I have every confidence in recommending it."  
 Mr. J. BELL, the Duke of Wellington's Gardener, says:—"Your Weed Killer will prove to be a great boon. It not only destroys every form of weed but leaves the gravel bright and clean."  
 Mr. W. EDWARDS, Gr. to the Right Hon. Earl Craggan, says:—"I have used it (the Acme Weed Killer) on the walks, and plantain on cricket ground. It seems to answer well."  
 Mr. JAMES MYERS, Gr. to the Earl of Sandwich, says:—"I must say it does its work very effectually."  
 Mr. R. IRWIN LYNCH, Curator, Botanic Garden, Cambridge, says:—"There can be no question with regard to its efficacy."  
 T. HEWITT & Co., Nurserymen, Solihull and Birmingham, say:—"We find it excellent."

Price per Gallon, 2s. (tax included); 5 Gallon lots, 1s. 6d. per Gallon; 10 to 20-Gallon lots, 1s. 4d. per Gallon.

## Estate Sales.

The best County medium for Advertising Sales of  
Estates is

**THE WORCESTER HERALD**, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agriculturists  
in and around Worcestershire. Specimen copies sent  
free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to Let, would do well to advertise in

**THE WORCESTER HERALD**, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circulation,  
moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.

Offices, 72, High Street, Worcester.

## NORWICH.

## GARDENING APPOINTMENTS.

Mr. J. GIBSON, for the last eight years Head  
Gardener to Sir L. M. S. PILKINGTON, Bart., of  
Chevet Park, has been appointed Head Gardener  
to E. W. STANFORTH, Esq., Kirkhammerton  
Hall, York.

Mr. S. BRIGWOOD, late Foreman in the gardens,  
Effingham Hill House, Dorking, has been ap-  
pointed Head Gardener to T. NARBURGH, Esq.,  
Summerfield House, Elstree, Herts.

Mr. C. PAGE, late of Fern Lodge, Bracknell,  
has been appointed Gardener to H. P. LES-  
CHALLIES, Esq., The Highams, Bagshot, Surrey.

Mr. W. WILSON, for some years Foreman at  
Droptone, Maidenhead, has been appointed  
Gardener to W. BARRON, Esq., Sefton Park,  
Slough.

Mr. E. HODGSON, late Foreman at Ash Grove,  
Sevenoaks, has been appointed Head Gardener  
to G. W. WILLIAMS, Esq., Piggett's Manor,  
Latchmore Heath, Elstree, Herts.

**PARTNER, Practical or Amateur, WANTED.**  
with small Capital to develop Nursery. Good position.  
Long lease. Four miles from Covent Garden.—FELIX, 57,  
Crystal Palace Road, East Dulwich, S.E.

## WANTED, A HEAD WORKING

GARDENER (others kept), who thoroughly under-  
stands his duties. Wages £1 and cottage; 2 tons of coal yearly.  
—Mr. GIBSON, Schenel, Sittingbourne.

**WANTED, A HEAD WORKING GAR-**  
DENER, for a Gentleman's Establishment, where the  
chief part of the produce is sold.—Must be thoroughly com-  
petent in all branches, including Packing Fruit and Flowers,  
and Making Bouquets, Wreaths, &c., and with special knowl-  
edge of growing Chrysanthemums, Roses, Violets, and Stove  
Plants. Must be a married man, and between 30 and 40 years  
of age.—Address, enclosing photograph, to J. P. *Gardeners*  
*Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, A GARDENER**, capable of  
Managing Small Nursery. Several Houses. Plants,  
Fruit, Tomatoes, and Cucumbers Grown. Three others em-  
ployed. Married, no children. Must be practical and thor-  
oughly reliable. Good residence on the place.—Apply with  
full particulars, E. L. GILES, Wells, Norfolk.

**WANTED, as SECOND GARDENER**, a  
married man. Without family preferred. Must be  
experienced in Indoor and Outdoor Gardening. Will be  
required to milk and take charge of Cows, &c. Wife must  
be a good Landress. Wages 27s. per week, with lodgings on  
the premises, milk, vegetables, and gas. Good references required.  
—Apply by letter to W. F., The Manor House, Richmond,  
Surrey.

**WANTED, A FOREMAN**, single, Houses,  
energetic, well recommended by Gardener. Wages  
£1, no boy.—J. H. VALLANCE, The Gardens, Reiland  
Lodge, Bristol.

## Outdoor Nursery Foreman and Salesman.

**WANTED, a competent MAN** as above. Must  
be a good Budder and Grafter, and thoroughly experi-  
enced in General Outdoor Nursery Management.—Apply in  
own handwriting, stating wages expected, to B. MALLER  
AND SONS, Burnt Ash Lane Nurseries, Lee, S.E.

**WANTED, A SECOND ORCHID GROWER**,  
for the Trade.—Only an experienced man need apply.  
State wages.—*Gardeners' Chronicle* Office, 41,  
Wellington Street, Strand, W.C.

**WANTED, a good strong working young**  
MAN, not under 20 years of age, to work on Pleasure  
Grounds and in Kitchen Garden, and make himself useful.  
Only those whose character can bear strict investigation need  
apply.—F. H., The Gardens, Harewoods, Blithingley, Red  
Hill, Surrey.

**WANTED, a thorough steady and trustworthy**  
young MAN, to take charge of the Greenhouses.  
Wages 15s. per week, with boy.—R. DOVER, High Leigh,  
Hoddesdon, Herts.

**WANTED, as SHOPMAN**, a qualified man,  
to take charge of Counter in Retail Trade. Must have  
fair knowledge of all-round business.—State salary required,  
with references, to G. DALEY AND SON, Seedsmen, Coleraine,  
Ireland.

**WANTED, a thoroughly efficient CLERK**,  
in a high class country Nursery. Well up in the  
Seed and Bulb Trade, and able to prepare Nursery and Seed  
Catalogue in first-class style. Must be methodical and trust-  
worthy.—Address full particulars, age, wages, experience, &c.,  
G. G. *Gardeners' Chronicle* Office, 41, Wellington Street,  
Strand, W.C.

**A VACANCY** will shortly occur for an  
INVOICE CLERK, who has had good experience in  
the Nursery and Seed Trade; also for a SHOPMAN, well up  
in all departments of the business.—Apply, stating age,  
qualifications, and salary required, to LITTLE AND BALLAN-  
TYNE, Carlisle.

**WANTED, as SECOND CLERK** (several  
being employed), a steady, painstaking Man, accus-  
tomed to the general routine of Counting-house Work. A  
comfortable and progressive appointment. None need apply  
whose character will not bear the strictest investigation.—  
Give particulars of age, qualifications, and wages expected,  
to THOMAS S. WARE, Hale Farm Nurseries, Tottenham,  
London.

**Floral Mounter and Saleswomen**  
**WANTED, smart and skilled. Call.—W.,**  
Earl's Court Entrance, Italian Exhibition, 11 o'clock,  
from Tuesday.

**WANTED, Gardeners and Others, to accept**  
AGENCY for our CHOICE CEYLON TEAS, to sell  
among Private Families. We give 6d. per pound on the 2s.  
cost. No need be filled in payable to No. 42, DRURY LANE,  
to W. RICHARDS, as, unless the name of a Postal Order is  
known, and it has been made payable at a particular office, and  
to a particular person, it is impossible to prevent any person  
indecently handing it away from negotiating it.

N.B.—The best and safest means of Remitting is by POST-  
OFFICE ORDER.

## WANT PLACES.

**NOTICE TO ADVERTISERS.**—In many instances  
Remittances in Payment of Repeat Advertisements  
which are not without delay, and are sent by the  
postmark on envelope by which to identify the sender; this  
in all cases causes a very great deal of trouble, and fre-  
quently the sender cannot be identified at all.  
Advertisers are requested when Remitting to give their  
Names and Addresses, and also a Reference to the Adver-  
tisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and  
Others.—It is very important in Remitting by Postal Order  
that it should be filled in payable to No. 42, DRURY LANE,  
to W. RICHARDS, as, unless the name of a Postal Order is  
known, and it has been made payable at a particular office, and  
to a particular person, it is impossible to prevent any person  
indecently handing it away from negotiating it.  
N.B.—The best and safest means of Remitting is by POST-  
OFFICE ORDER.

**Gardeners, Farm-Bailiffs, Foresters, &c.**  
**DICKSONS (Limited)** are always in a  
position to RECOMMEND MEN  
of the highest respectability, and thoroughly practical at  
their business. All particulars on application.—Telegraphic  
& Postal Address "DICKSONS, Chester."

**Head Gardeners.**  
**JOHN LAING AND SONS** can at present  
recommend with every confidence several energetic and  
practical MEN of tested ability and first-rate character. Ladies  
and Gentlemen in want of GARDENERS and BAILIFFS, and  
HEAD GARDENERS for first-rate Establishments or Single-  
handed Situations, can be suited and have full particulars by  
applying at Stanstead Park and Rutland Park Nurseries,  
Forest Hill, London, S.E.

**RICHARD SMITH AND CO.**  
beg to announce that they are constantly receiving  
applications from Gardeners, seeking situations, and that they  
will be able to supply any Lady or Gentleman with particulars,  
&c.—St. John's Nurseries, Worcester.

## SCOTCH GARDENERS.

situation. Is thoroughly capable in all branches, also in  
general Estate Work. Best references.—BRITAN AND  
SON, Waterloo Nursery, Salisbury.

**HOLLOWAY'S PILLS and OINTMENT. —**  
Glad Tidings.—Some constitutions have a tendency to  
rheumatism, and are, throughout the year, borne down by its  
protracted tortures. Let such sufferers bathe the affected parts  
with warm brine, and afterwards rub in this soothing Ointment.  
They will find it the best means of lessening their  
agony, and, assisted by Holloway's Pills, the surest way of  
overcoming their disease. More need not be said than to  
request a few days' trial of this safe and soothing treatment,  
by which the disease will ultimately be completely swept  
away. Pains that would make a giant shudder are assuaged  
without difficulty by Holloway's easy and inexpensive remedies,  
which comfort by moderating the throbbing vessels and calming  
the excited nerves.

## DICKSONS

(LIMITED).

Royal Nursery and Seed Establishment,

**CHESTER.**

**BEESEON'S MANURE.**—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s., 3s., 6d., 10s., and 10s. 6d. each, or 1 cwt. Bags, sealed 13s. By all Seedsmen, or apply direct to W. H. BEESEON, Carbrook Bone Mills, Sheffield.

**GISHURST COMPOUND,** used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft-water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in latter from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

**To Horticulturists.**—Great economy in Fuel, and other advantages secured by the use of our **SMOKELESS ANTHRACITE.**—For information as to the mode of using this coal, and prices delivered to any railway station, apply to the TRIMSTAR CO. (Limited), 62, Leadenhall Street, London, E.C.

**PATENT TUBULAR FLOWER STANDS** for Artistic Grouping of Cut Flowers, have attracted much attention at recent Horticultural Exhibitions. Manufactured and Sold by GEORGE SMITH AND CO., Commercial Road, Pimlico, S.W. Trade supplied.

## SPHINCTER GRIP GARDEN HOSE.

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured. Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

For Price Lists and particulars of The Original and Only Genuine Sphincter Grip Armoured Hose,

APPLY TO THE  
**S.C.A. HOSE CO. (Ltd.),**  
63, FORE STREET, LONDON, E.C.  
(Unprecedentedly low prices.)

ESTABLISHED, A.D. 1813.

# NOTICE

TO THE

## HORTICULTURAL TRADE.

HAVING for some years past, owing to the particular nature of my business as a Horticultural Agent, recognised to the fullest extent the absolute importance of securing speedy transit and quick delivery, in the case of all plants sent from the Continent to England and vice versa; and having myself suffered great inconvenience, annoyance, and loss from causes which could easily have been avoided, had the shippers entrusted with plants possessed any practical knowledge of their nature and requirements, I beg to inform you that, my business with the Continent having become so extensive, I am now obliged, in self defence, to take up the business of a

## SHIPPING AND FORWARDING AGENT.

I am so well aware of the serious consequences of a few hours frost in the case of plants left on the wharf for a night—as frequently happens—and which by a little care in warehousing can be easily avoided, to the great benefit of sender and buyer, that I have determined in future to give all such details my closest personal attention, and beg you to recognise the advantages which will thus be gained by your shipping all your consignments to this country through me.

I have secured admirable premises for this branch of my business at 12, Cooper's Row, Crutched Friars, London, E.C., and with the available accommodation at the various wharves for the proper and prompt warehousing of the most tender plants, am in a position to assure you that I possess every facility for conducting the business in a manner that I am sure will give satisfaction to those who may favour me with their patronage and support.

**WILLIAM DENMAN,**

THE

## Gardeners' Chronicle.

SATURDAY, AUGUST 11, 1888.

### THE ROSE SHOWS OF 1888.

IT is quite clear that there is one subject on which it will never do to prophesy in England, and that is the weather; we see how often the forecasts issued by the Meteorological Department are wide of the mark, and so we need not be surprised if those of us who can only make guesses are often woefully wrong. Thus I had ventured to say that there was every prospect of a good Rose season, and so, when I wrote, there was; but on looking forward I believe that I cautiously added an "if"—if we do not have some thunderstorms; and now that the Rose show season is over I think the epithets "aggravating" and "disappointing" are those which are most applicable to it. I have seen a good many Rose seasons, but I do not ever remember one more irritating to the exhibitors (of whom I am not one) than the season of 1888 has been. Societies whose existence depends on the gate-money, exhibitors who have desired to gain honours in the strife, and lovers of the Rose who have wished to see for themselves the best productions that the skill and intelligence of our growers have been enabled to produce, have all alike had to suffer disappointment. Some societies have been fortunate in securing a fine day, but many have had to hold their shows in the midst of heavy showers and sloppy meadows, while in some cases the mishaps have been especially worrying.

It may give some idea of the character of the season, and how it has affected the Rose shows, when I mention that the number of entries at the Metropolitan Show of the National Rose Society at the Crystal Palace numbered 531 (the largest number ever recorded at any Rose show), while the number actually staged was 306. It will also show who were most affected, when we find that in the higher classes both of traders and amateurs there were few absentees, but that as we come down to the lower and smaller classes the falling out was most decidedly marked. This was notably the case in the Tea and Noisette divisions, in the larger classes of which the exhibits were

only less than the entries by two or three, while in the smaller classes they were reduced by nearly one-half; but the falling-off was most noticeable in the classes for light-coloured Roses, or what are called fair-weather Roses. Thus in the class for twelve blooms of Her Majesty, it was reduced from ten to one solitary exhibit. The same held true of Niphetos. The class for twelve blooms of Lady Mary Fitzwilliam was reduced from fifteen to three, while that for A. K. Williams was reduced one-half only—from nineteen to ten; and of dark velvety Roses from twenty-one to nine. The same held good at nearly all the shows that I have attended, and in some cases it must have been most trying to the patience of the exhibitor. Thus one looked forward to a great contest between North and South at Darlington, when it was hoped that Messrs. Grant, Whitwell, Hall, Pemberton, and others would have tried their prowess. They had all entered, but Mr. Grant had to telegraph that a storm had completely destroyed his Roses; and what must have been most trying was that half a mile on either side of his garden it was perfectly fair, while, as I have already stated, Mr. Whitwell had not one Rose in bloom in his garden, although he has once taken the Challenge Trophy at the Metropolitan show on the first Tuesday in July.

When we come to the quality of the Roses I fear that we must state of the season generally that it was distinguished for "mediocrity." In calling to mind the flowers I have seen there are no standards which dwell in one's memory as in former years—no blooms that linger in one's mind as a "joy for ever." There have been good boxes of blooms, and some fine individual flowers, but that is all that can be said, I fancy, concerning them. There were some dark coloured flowers—old favourites—which came quite to the front, such as "General Jack," as he is familiarly called, Charles Lefebvre, Prince Arthur, a son of the General's, but very much darker; while the light coloured Roses, or rather those which are very full, suffered terribly. I have been surprised to find how well such flowers as Baroness Rothschild, Merveille de Lyon, and White Baroness have withstood the most drenching rain, while flowers like Monsieur Noman, Lady Mary Fitzwilliam and Her Majesty were simply lads of rotten leaves, making no attempt to open, and defacing the beds with their unsightly buds. It is very difficult to judge as to Teas, as to whether they have been grown under glass or not. Where there is a house, of course the exhibitor has a great advantage, and some of the best stands were aided by flowers so grown. In many cases they were skinned—that is, all the outer petals which had been discoloured were stripped off—of course greatly disfiguring them, but rendering them at the same time presentable; still they were only half Roses. It was, however, on the whole very wonderful how, in the midst of such weather as we have had, such clear blooms could have been produced from plants which one knew to be grown in the open—clearly evidencing how much the culture of Teas Roses has advanced.

There were two subjects connected with Rose showing concerning which a good deal was said at various times and places during the show season. The first was the question of amateurs selling Roses. This subject was very much discussed some years ago, and was brought under the consideration of the committee of the National Rose Society, and a rule was framed prohibiting persons who "habitually" sold Roses from exhibiting in the amateurs' class. It would appear, however, that a rather narrow interpretation has been given to the word, and that what some consider habitual others consider only occasional. It is said, and said with justice, that a gentleman who buds his 1000 or even 500 every year, and in order to make room for them sells off his old stock, fights at a great advantage those who

never sell, and that it matters little how he does this—whether he has an auction and so disposes of them, or hands them over to a neighbouring nurseryman, he is virtually a trader and not an amateur; while many say it destroys the pleasure of Rose showing when you know you are competing with men who thus handicap you in the race. Very strong things have been said, and I presume that we shall hear more about it; but I hope and believe, whatever steps are taken will be made in a conciliatory manner, and that the good feeling of those who are supposed to do these things will lead them to change their method of showing and growing.

Another subject about which exhibitors' minds seemed to be very much exercised was what is called "pot hunting," i.e., exhibitors being more regardless of the amount of money they can get than the honour and glory of the warfare; and that thus, instead of exhibiting in the classes in which the number of the plants they grow would seem to place them, they go down to lower classes, and by their big battalions overpower them. It is possible that an amateur, who grows under 200 Roses may show a twelve that will beat the exhibit of one who grows 1000; but it is not likely, and if he does, he deserves immense credit for his pluckiness. Now no rule that a society can make can prevent this. The National, in order to give all a fair chance, made a number of small classes, and yet, withal, many amateurs are to be found exhibiting in these classes who ought not to think of it. I remember some years ago, at the Crystal Palace exhibition of the National Rose Society, one who was currently reported to grow 10,000 trees setting up a stand in a class of six, eliciting the caustic remark, "I think it would be very nice were they to make a class of three for Mr. —," but as I have said, no rule that can be made can meet such cases—they must be left to the honour and good feeling of English gentlemen, although I cannot but think that if the "National" were to pass a resolution condemning the practice it would have a good effect.

I hope to follow these notes up with some on the new and semi-new Roses that have been exhibited, although not in the number one might have expected or hoped. *Wild Rose.*

## ORCHID NOTES AND GLEANINGS.

### EPIDENDRUM NEMORALE (E. VERRUCOSUM).

THE fragrance and beauty of the flowers of this Orchid, together with its free-growing character, make it one that may certainly be included amongst the comparatively few Epidendrums that are worth cultivating. It belongs to that section of the genus with short, round pseudobulbs, the flower-spike rising from between the two long narrow leaves at the top. The flowers, of which ten or twelve occur on a spike, measure 3 to 4 inches across, and are of a delicate pale rose colour; the lip is prettily veined with purple, and in some varieties has a patch of white in the centre, which, however, is absent in others. It is figured in the *Botanical Magazine*, t. 4606, as *E. verrucosum*, a name under which it is known in some gardens now. It is a native of Mexico, and succeeds well in the intermediate-house potted in fibry peat and sphagnum. A plant is now flowering at Kew.

### BRASSAVOLA LINEATA.

A plant of this at Kew has been displaying its large white flowers for several weeks past; indeed, there are few Orchids whose flowers last longer in perfection than these. The whip-like, terete leaves, 2 feet in length, greatly resemble those of *Scuticaria*, and, like them, grow in a downward direction. The sepals and petals are linear, and about 3 inches long; the lip is cordate, and measures  $1\frac{1}{2}$  inch in diameter, the whole flower being of pure ivory-white. This plant grows and roots freely on a piece of Fern-stem or Teak block, and if suspended from the roof its

flowers and curious habit are shown to advantage. The intermediate-house suits it, giving abundance of moisture when growing, and a well-marked period of rest after growth is completed.

### CYPRIPEDIUM PARISHII.

Numerous and popular as are the different forms of *Cypripedium* there are few having a better claim to notice than this species, which flowers at this season. It is nearly related to *C. laevigatum*, to which it bears some resemblance, especially in habit; that species, however, is a native of the Philippine Islands, while *C. Parishii* comes from Mouline, where it was originally found in 1859 by the veteran Orchid discoverer after whom it is named. The prevailing colour of the flower is pale green; the petals, however, which are twisted and nearly 5 inches long, are dark purple for two-thirds of their length; the slipper also has a purplish tinge. The apex of each petal is rounded and edged with short hairs. No collection of *Cypripediums* should be without this species, for even out of flower its thick dark green glossy leaves make it a very handsome plant. It requires to be grown in the warm house. *W. B.*

### EPIDENDRUM TAMPENSE, Lindl.

This graceful little *Epidendrum* has long been known in herbaria, having been originally described by Lindley, from a dried specimen collected in Tampa Bay, Florida—the locality whence it was obtained being commemorated in the name given to the species. Until the other day I had no evidence of its being in cultivation; Mr. James O'Brien, however, sent me an *Epidendrum* to name which had been imported from Florida, and which I was able to identify with Lindley's specimens. It is one of the few *Epidendrums* found in Florida, and at present is not known from elsewhere. The specimen received consisted of a pseudobulb, leaf, and inflorescence, and from it the following notes were taken:—Pseudobulb ovoid, small, and narrowed above. Leaf narrowly linear, 6 inches long by  $\frac{1}{2}$  inch broad, scape slender, exceeding the leaves, smooth, and brownish in colour. Flowers  $1\frac{1}{2}$  inch across. Sepals linear, obtuse, narrowed below, light yellowish brown in colour. Petals similar, but more narrowed below, light yellowish-brown in colour. Petals similar, but more narrowed below. Lip white, the front lobe rounded, obtuse, with a number of radiating purple lines, which become somewhat confluent into a blotch; the side lobes linear with a few faint purple lines below. Also the narrowed base of the front lobe has a number of purple lines which become almost confluent on the callus. The column is greenish-white, with a pair of short, angular teeth on the angles, and three to five light purple stripes on the back. It belongs to the section *Encyclium*, distinguished by the nearly free lip, and is, perhaps, the smallest and most slender species in the group. *R. A. Rolfe.*

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 128.)

PRIESTLEY: OXYGEN.—Two years more elapsed before Priestley found that. But from 1756 Black had been a Professor of Chemistry, first at Glasgow and then at Edinburgh (which post he held thirty years), and he was so assiduous in preparing his lectures that he allowed himself no time for investigation. Of course he had to run much on the old lines, as the new discoveries were not yet sufficient to constitute a new science. Cavendish was fully occupied with other researches.

Priestley was mostly known during his lifetime as a Nonconformist divine. One of his biographers (Lord Brougham) has said of him that though he was trained in Latin, Greek, Hebrew, Syriac, and Chaldean, he was only half trained in chemistry, and able only to experiment. What a blessing! It was experiment that was needed to advance chemistry. When living at Leeds in 1767, near a brewery, he

had experimented on the "fixed air" given off during fermentation; had also, in 1772, examined azote, and at Birmingham, on August 1, 1774, he made his important discovery of the air we now call oxygen. He called it dephlogisticated air. The following year it was independently discovered by Scheele in Norway. He called it empyreal air. From the discovery of oxygen the new chemistry took its rise. Priestley's statue at Birmingham represents him in the act of making his discovery. It is on record \* that he first obtained it (in a closed vessel heated by a burning lens), from minium commonly called red lead (red oxide of mercury). From the statue few would know that. But then Newton, in Trinity Library, is represented (so it has been facetiously put) as making the remarkable discovery that you cannot see through a plaster prism!

In this same year Stahl found the gas now called fluorine, and many others were soon studied.

#### CAYENDISH—WATER, &c.

Cavendish, who had been studying "nitrous air" and the atmosphere in relation to it, read at the Royal Society in January, 1784, his celebrated paper, "Experiments on Air," in which he described his experiments that led to the discovery of the composition of water and of nitric acid. Till oxygen had been discovered as a separate "air" the union of inflammable air (hydrogen) with dephlogisticated air (oxygen) to form water could not, of course, be known; it was practically a continuation of his previous experiments with H, but he now exploded it in O instead of air.

We thus see that in the thirty years following (1752) Black's first observations on "fixed air," that H, O, N, had been discovered as distinct airs or gases, that some compounds of C and N were investigated, the composition of water was made known, and the composition of the atmosphere was receiving increased attention. All of these studies lay at the commencement of our modern chemistry.

#### DALTON'S ATOMIC THEORY.

Activity in chemical research had been by this time aroused in several centres of civilisation in Europe, and many experiments were made. Guyton de Morveau, in 1782,† wrote an essay on a new nomenclature to represent the then state of the science, but the next great step in advance was Dalton's question, What do all these facts mean?

Dalton (b. 1766) had from 1796 given considerable attention to the constitution of the atmosphere when in 1802 he communicated to the Manchester Society a paper, "An Experimental Inquiry into the Proportion of the several Gases or 'elastic fluids' Constituting the Atmosphere." It is worth noticing his analysis, as it is an illustration of the way in which analyses were in his time given in percentages:—

Azotic gas	...	...	75.55 by weight.
Oxygenous gas	...	...	23.32 "
Aqueous vapour...	...	...	1.03 "
Carbonic acid gas	...	...	0.10 "
100.00			

A great many chemists set about examining the constitution of the atmosphere, with different results. We now know that it is only the azotic gas (nitrogen) and the oxygenous gas (oxygen) that have a constant proportion, while the carbonic acid gas and the aqueous vapour and other constituents vary according to circumstances.

Dalton's paper, however, has a higher interest. In it he mentions that he found that 100 measures by weight of common air would combine in a narrow tube with 36 measures of pure nitrous gas or with 72 in a wide vessel—72 is the multiple of 36. The combination would take place in no intermediate quantity. He subsequently examined the gases known as light carburetted hydrogen and heavy carburetted hydrogen, and here he found the carbon in the latter double that of the former. This set him thinking about the proportions by weight in which

combinations take place, and he enunciated the view that they all do so in some definite proportion or some multiple of that proportion. This, which is now known as the law of chemical combination in multiple proportion by weight, has been so definitely established by countless experiments, that it forms the foundation of all chemical work. (One illustration may make the law clear. There are five distinct compounds of N and O known, and the proportions by weight of O in them are 16, 32, 48, 64, 80, to 28 of N in each case.) A year later he read another paper in which he stated what he conceived to be the explanation of these facts. The paper was entitled "On the Absorption of Gases by Water." In it he asks the question, Why does not water admit its bulk of every kind of gas alike?—and his reply is, "I am nearly persuaded that the circumstance depends on the weight and number of the ultimate particles of the several gases. . . . An enquiry into the relative weight of the ultimate particles of bodies is, as far as I know, entirely new." This guess or theory he proceeded to work out, and in 1805 published his first paper "On the Weight of the Atoms of Different Bodies." This theory to account for the law is quite apart from the law itself. The law is an established fact. The theory may possibly even yet turn out to be not the fully true one. Gay-Lussac's paper of 1809,\* "On the Combination of Gases by Volume," for a while caused some confusion, especially to Dalton himself. Gay-Lussac showed that gases combine with one another by volume in proportion of 1 to 1, 1 to 2, 1 to 3, &c., but no intermediate volume. A study of the question, which it would take too long to enter into, showed that the two lines of research were confirmatory, and not antagonistic. Dalton's theory is known as the "atomic theory." The Swedish chemist, Berzelius (who, following Richter, was working at the same subject), brought out in 1812 his paper "On the Fixed Proportions and Weight of Atoms," based on exact and manifold experiments.

Whatever may be the future of the atomic theory, it is accepted as at least "a good working hypothesis." Repeated experiments, with instruments of delicate precision have been made since Dalton's time. On the theory or assumption that the relative combining weights of different "bodies" (as Dalton called them) indicates in all known combinations the relative weights of their atoms we have our tables of atomic weights of the elements, W. S. M.

(To be continued.)

## HARDY FLOWERS FROM HOLLAND.

MR. C. G. VAN TUBERGEN, jun., of Swannenburg, Haarlem, has sent another collection of Lilies and hardy flowers from his nursery, amongst them a handsome spike of *L. Hansonii*. This species has proved itself to be a better garden plant than it was thought to be at first. It was at one time confounded with *L. avenaceum*, and when exhibited for the first time at South Kensington it was awarded a Second-class Certificate. Later—on June 18, 1878—a fine pot of it was exhibited by Mr. G. F. Wilson for a second time before the Floral Committee, when it received a First-class Certificate. It has since proved to be an excellent garden plant, well deserving the highest award; in fact, the gravest objection to Second-class Certificates is contained in the fact that perfectly new plants are seldom shown at their best the first time, and a first-class thing may be depreciated in value for lack of sufficient material to show its intrinsic worth. The lovely *Chionodoxa Lucilæ*, for instance, was passed over the first time, and received a First-class award when ample material was available.

*L. pardalinum*, with stems 8 feet high and seven flowers on each, is a noble Lily. We have it in our own flower borders, but it has never exceeded 6 feet;

probably our soil is too dry for it, as it seems to be a moisture loving plant. Dr. Bolander, who saw it growing in its native haunts in California, describes it as a magnificent Lily, attaining a height of from 6 to 9 feet, at an altitude of about 4000 feet, and growing in wet, boggy soil. The petals are yellow, densely spotted with purple red dots; the tips of the petals are orange-red, and unspotted. *L. pardalinum angustifolium* is also sent; it is richer in colour, the petals as well as the leaves being longer and narrower. *L. Parryi* came to hand in capital condition, and grows freely over there. Its clear yellow flowers, lightly spotted, are exceedingly pretty. As a choice border plant, it takes high rank amongst Lilies. It is from the same altitude in California as *L. pardalinum*, and was discovered "in the Potato patch of a settler in boggy soil."

A vigorous spike of *L. Martagon dalmaticum* shows what an excellent border plant it is; the flowers deep purple, faintly spotted. The good old *L. chalcedonicum* is also amongst them. Its native habitat is Hungary, and always on the tops of the mountains.

A spike of *L. excelsum* was sent to show the vigour of this species, the buds were unopened; but these open when the spike is placed in water. This has been grown in England on spikes 6 feet high, and twenty-four flowers on a spike.

*L. philadelphicum*, an interesting and distinct species, is well known, and was first grown by Mr. Philip Miller in 1757. The flowers are orange-red, with blackish red spots. Miller considered this and *L. Catesbei* to be "less hardy than some of the other sorts."

*L. Krameri*.—This fine species, or hybrid, was also sent—a deeply coloured form of it. Mr. Baker believes it to be a hybrid between *L. speciosum* and *L. japonicum*; but whatever it is, it is a beautiful Lily, and succeeds well in the open border. I was talking about this Lily to Mr. G. F. Wilson the other day, and he says it has been grown with as many as nine flowers on one stem with Mr. McIntosh, at Danevan. One, two, and three flowers on a stem are more frequent. This has large delicate pink flowers. This and *L. auratum* thrive admirably in the soil of Rhododendron beds.

Four more distinct forms of *L. Thunbergianum* show how this useful old species varies not only in the colour, but also in the form of the flowers. By far the best is a new form introduced from Japan, and unnamed. The flowers are well formed, and of a decided scarlet shade.

Pictum is a free-flowering vigorous variety, with reddish-orange coloured flowers; sanguineum is dark coloured, but the form of the flower itself is not good. The darkest variety is grandiflorum, but it is a misnomer, as the flowers are not large nor of good form. The variety grown in England has orange-yellow flowers of good substance. Mr. Tubergen's variety corresponds with our atro-sanguineum.

The silvery variegated form of *L. longiflorum* is a pretty plant for borders or pot culture. A long healthy spray of *Littonia modesta* Kettili is also sent with the note, "Darker in colour and more numerous flowers than *L. modesta*. Against a very warm and sunny wall a lovely thing!"

The flowers are orange-yellow, and one is produced at the axil of each leaf. It forms a curious tuber as large as a Spanish Chestnut. *Tricyrtis macropoda* is a novel plant for the herbaceous border. It is probably a better garden plant than *T. hirta*, which flowers too late in the autumn to do any good. It has creamy flowers densely spotted.

A handful of *Brodiaea grandiflora* shows most vigorous development. It was named in honour of Mr. J. Brodie, of Brodie, in North Britain. Douglas collected it for the Royal Horticultural Society in dry plains west of the Rocky Mountains, and it blossomed in the gardens of the Society in July, 1823, in the open border in peat soil.

A bunch of *Ixia Galatæa* represents the best of the late flowering varieties. It has well formed pure white flowers with a black centre.

A few specimens of a bulbous plant with yellow

\* Phil. Trans., lxx., p. 337.

† Observations de Physique, 1782, May, p. 371.

\* Mémoire sur la combinaison des substances gazeuses les unes avec les autres. Arcueil. Mem. de physique, II., 1809.

flowers, named *Calliprora flava*, are sent. It is a distinct and pretty hardy plant, not differing in any respect from *C. lutea*. It is another of the introductions of Mr. David Douglas from California.

Some of the scapes have a score of flowers upon them. Some trailing growths of *Tropæolum polyphyllum* and a big handful of *Iris Kämpferi* complete the collection. The Lilies are the most remarkable, and prove how valuable they are as border and pot plants. *J. Douglas*.

### CLEMATIS JACKMANNI ALBA.

SOME quarter of a century ago I had learned to appreciate the extraordinary value of *Clematis Jackmanni*, and when admiring it the exclamation frequently arose, "What a glorious thing a white Jackman would be!" At that time I had just succeeded in raising the beautiful set of patens varieties—Miss Bateman, Albert Victor, Lady Londesborough, Lord Londesborough, and a host of others, all lovely, and still holding their own, as they are still unsurpassed. I tried all ways I could think of, and at last after—I am afraid to say how many—years I succeeded in getting a cross between Jackmanni and white patens. From this number of seedlings no break at all appeared of any importance, except the present subject, but it flowered, and I was delighted, and showed it to one or two people, and told many more; its after history is well known—its hairbreadth escapes, almost total loss, its disappointments, its condemnations. I had planted out a specimen, and watched its opening flowers, when, to my disgust, it produced a nondescript, dirty bluish abortion. I said "Propagate no more!" and for a year or two I crestfallenly admitted to all my friends that Jackmanni alba was a disappointment, and should never be sent out. After a time, however, I remembered the parable of the Fig tree, and said "Dig about it, and try again." It was done, and at last, in 1883, it appeared in public in its true form. A good many thousands have now been circulated over the world, and although I have had some very pointed questions put to me respecting these abnormalities, one or two abusive letters, and one case of a Dutchman who refused to pay, I may say that altogether I am quite satisfied with my child; but its habit of producing the nondescript flowers is very curious indeed. The flowers produced from the old wood during the months of May, June, and July, are double or semi-double, solitary, and of a bluish French-grey; while those produced from the young shoots, in August and September, are single and white, in pairs on a long raceme, showing as many as ten pairs and a terminal on a string. This is one of those freaks of Nature which are such sore puzzles to the poor unsentimental ones. It appears to me that the union of the blood of patens, a spring-flowering kind, with Jackmanni, an autumn type, is complete so far, but that a kind of rivalry, if I may use the term, is set up to see which type is the stronger. As far as my experience has gone, the patens form is never white, and only flowers when the old wood is left growing, but always appears during May, June, and July, while no Jackmanni form is ever seen during those months; on the other hand, when the old wood is cut away no patens is ever seen, but Jackmanni commences and produces a mass of flowers on the shoots of the year during August, September, and October, as true Jackmanni does.

I have one other case, perhaps equally curious, though different; the kind named *Proteus* produces large double flowers about June; it then rests a month or so, and then commences to flower again, producing its second crop of flowers quite single, but of the same colour.

I wish some of the thousands who have grown Jackmanni alba would give their experience, because it seems to me a very interesting problem, and it would be well to know if the plant has perpetrated any further freaks. As far as I know, the purple Jackmanni never flowers in the abnormal way just described with regard to alba, whether allowed to flower on old or young wood, though in both cases

(purple and white) the four or six parted flowers are produced on plants more or less robust. If very strong, the first burst of flowers will, many of them, be six-parted in both kinds.

As regards the origin of *C. Jackmanni*, all I can say is that no *Clematis* approaching the character of Jackmanni ever came under my notice through Mr. Fortune, either from China or Japan, as far as I can remember. Fortunei, Standishii, lanuginosa, and lanuginosa pallida, and, lastly, John Gould Veitch, were all Fortune's importations. M. Lavallée's notion, that *C. Jackmanni* is the *C. hakonensis*, a native of Japan, is very curious. I myself believe implicitly in Jackman's version against it, but there are so many extraordinary things amongst plants, that it is not safe to speak positively. There is, for instance, the remarkable *Cytisus Adamsi*, whose story need not, perhaps, be repeated here.

*SPIRÆA NOBLEANA*.—Then in my own case I grew *Spiræa Douglasii* (North American) and *Spiræa callosa* (China), side by side. The plants seeded and fell on the ground, producing a crop of seedlings for yards round. The young plants were grown on, and a large number produced a form about midway between the two species. Dr. Lindley named it *S. Nobleana*; that was strange, but the most remarkable thing remains to be told. The same plant (identically the same) was raised the same year by the late Robert Donald, of Woking, and M. Lierval, of Paris; not only that, but Dr. Lindley told me he had dried specimens from North America agreeing exactly botanically with my *Spiræa*. I myself saw the plants growing in Mr. Donald's and M. Lierval's grounds. *Charles Noble, Bagshot*.

### FUNKIAS.

SEVERAL of these are highly ornamental on account of their foliage, and there are few things that give a more tropical appearance to certain parts of a garden than they do when judiciously placed, as, though not of large size, they are of bold contour, and very striking and effective in the rich hue of the leaves. One of the finest in this respect is *F. Sieboldi*, which is the largest of the species, plants of it in suitable soils or situations attaining a height of 3 feet, the stems being stout and strong, and the foliage somewhat heart-shaped, and from a foot to 15 inches across, the colour being of a peculiar blue-green with a metallic hue, which renders it very distinct. Not only is this Funkia a striking object as regards its leafage, but the flowers are effective, as they are Lily-like in appearance, and are borne on tall spikes, where they show off in fine contrast to the foliage below.

There is another species, *F. Fortunei*, which resembles the one just referred to, but its leaves are of a stouter texture and more glaucous in hue. The next most noteworthy Funkia in point of foliage is *F. ovata*, the leaves of which are large and broad, and the habit of the plant strong and robust. *F. subcordata* is another fine species which has big heart-shaped leaves, less ribbed than those of *F. Sieboldi*, and not nearly so glaucous, the flowers being creamy white, and borne on shorter stems than the others. *F. grandiflora* (fig. 17, p. 153) produces the finest blooms, which are borne in tufts on the top of tall spikes, and when fully expanded make quite a show. *F. lancifolia* has, as its name implies, lance-shaped leaves, and there are many beautiful and interesting varieties of this well-known species that are prized for the rich markings of their foliage, one being *F. lancifolia albo-marginata*, which has an edging of white round the leaves; and *undivata*, which has the midrib marked with the same colours; *undulata variegata* is variegated, more or less, all over the surface. These last-mentioned look exceedingly well when grown in the herbaceous border, but they are more particularly adapted for edging large beds, where they associate well with other foliage, or help to tone down and form a suitable setting for gay

flowers. The four first-named are of great value in the sub-tropical garden or hardy fernery, where much may be made of them either in masses or single clumps, in either of which ways they always command admiration. Although Funkias will do in almost any soil or situation, that which suits those now being treated of is a partially shaded position, where there is plenty of depth of loose rich soil, and an abundant supply of moisture, as then the plants can send their fleshy roots down, and the foliage becomes more rich and handsome from the extra feeding it gets. The way to propagate or increase Funkias is by division, which may be carried out almost at any time, but is best done in the spring, just when the plants are beginning to start, a period when they may be taken up, and cut through, and divided into as many pieces as there are crowns, and each one will grow. *J. S.*

### REPORTS OF THE POTATO CROP UP TO JULY 20.

#### SCOTLAND.

**ABERDEENSHIRE**.—Potatoes are late, but there is no indication of disease. There are complaints in the fields of the crop not coming regularly, but should we now get warm weather appearances are in favour of a good crop. New Potatoes are not general, but with me Sharp's Victor still bears the palm as the first. *R. Farquhar, Fyvie Castle, Fyvie*.

**ABERDEENSHIRE**.—Potatoes, like most other vegetables, are very late, owing to the backwardness of the season, and the late frost cut down all the earlier sorts after they were 6 inches high. The general crop and field crops are now—since the copious rains of late—making a fairly good appearance, and up to this date there seems no appearance of disease. *J. F. Smith, Dun Echt Gardens*.

**AYRESHIRE**.—Potatoes look well in fields about here, and garden crops are good and clean. No signs of disease as yet. Dry warm weather very much needed now, the night temperature for the last fortnight being very low—seldom above 40°. *W. Priest, Eglinton Gardens, Irvine*.

**EAST LOTHIAN**.—Potatoes in the gardens are all looking healthy and promising, in the meantime; Old Ashleaf and Myatt's Prolific are of a fair size and good quality. We were exactly fourteen days later to begin using them this year than in 1887. Field Potatoes are all looking well at the present time, although late. But really the prospects of the farmer and the gardener this season are not very bright in this district at the present time. *L. Dow, Newbyth Gardens, Prestonkirk*.

**FARFARSHIRE**.—Potatoes are growing most luxuriantly, with every prospect of a good crop. It was far too good last season, and there have been far too many for folk and cattle to consume; in consequence some long Potato pits are yet untouched, as the prices would not pay the labour of lifting. *J. Mitchell, Panmure Gardens, Carnoustie*.

**MID-LOTHIAN**.—Potatoes, like all other crops, are fully a fortnight later than in an average season, but they are very healthy, and with the rain of the past fortnight they have grown vigorously, so that there is every appearance of a fine crop in the autumn, if we have an average dry and warm season to bring them to maturity. Early varieties are turning out well, although a little soft from the heavy rainfall. There are no signs of disease yet; but it has seldom appeared of late years in this district till the end of July, and for the last few years the attack has been slight. A succession of dry autumns has done much to lessen its virulence, and with another dry autumn the probability is that we shall hear little about it. *M. Dunn, Dalkeith Gardens, Dalkeith*.

#### ENGLAND—NORTHERN COUNTIES.

**NORTHUMBERLAND**.—Potatoes look well, but we have not yet lifted any. Planting could not be done before April, and since then the weather has been exceptionally wet and cold. On June 14 we had a

FIG. 17.—*FUNKIA GRANDIFLORA*: FLOWERS WHITE, POLLEN GRAIN MAGN. 320 DIAM. (SEE P. 152.)

severe hailstorm which injured the leaves, and I cannot say what kind of a crop we shall have. If the weather continues so cold as lately, we shall have no French Beans or Scarlet Runners, nor Vegetable Marrows—outside. *G. Harris, The Castle Gardens, Alnwick.*

— It is yet too early to speak with any certainty as to the Potato crop, owing to the very late season. Early kinds are lifting splendidly. The weight is below the average, but the tubers are of excellent

quality. Scotch Regents and Champions look well in the fields. I have not yet heard of any disease. *D. Inglis, Howick Hall, Lesbury.*

DORHAM.—In our district Potatoes are very backward, and the early varieties now being lifted turn out small in size but clean in the skin. The crop is fully three weeks later than usual, from absence of warmth. Late crops are the same, although now growing fast, and as yet there is no trace of disease. The haulm of field Potatoes has covered very little

of the ground. *J. Hunter, Lambton Gardens, Fence Houses.*

YORKSHIRE.—The Potato crops about here are very promising, but we have found some disease among the early kinds. The late crops in the fields look very promising, and will give large returns. *J. Shaw, Nunappleton, Bolton Percy.*

— In this district the Potato crops never looked better than they do now. No symptoms of disease so far, but I fear the continuance of wet weather we

have experienced will do much to favour its chances. It generally shows itself here about the end of July or first week in August. *W. Chuck, Broadworth Hall, Doncaster.*

— The Potato crop is likely to be a good one, but quite three weeks later than usual. Early sorts are scarce as yet. We had more than our usual quantity of rain in June, consequently the tops are very strong. We now want warm weather to complete the crops. *W. Culverwell, Thorpe Perrow, Bedale.*

— Early Potatoes a good crop—clear of disease. Late crops are healthy and promising, but the excessive rainfall—amounting to 4 inches already for the month of July—with thermometer at night down to 38° and 40°, I fear, must have a serious effect on them. *R. C. Kingston, Brantingham Thorpe Gardens, Brough.*

LANCASHIRE.—Potatoes, like everything else, are late, and to provide a supply at the usual time have had to be dug up at considerable sacrifice. It is yet too early to say anything of the disease, but the conditions calculated to generate it have been most favourable the past few days. *W. P. Roberts, Cuerdon Hall, Preston.*

#### EASTERN COUNTIES.

LINCOLNSHIRE.—The early Potatoes turn out well in this district, but somewhat later than previous years, owing to the prolonged cold weather. Early Rose and Mona's Pride are two good sorts about here, and are very clean and free from scab. As yet there is no sign of disease. The field and late crops are looking remarkably well. The heavy fall of rain was much wanted, and seems to have come at the right time. *Magnum Bonum* are a leading late sort here. *T. Rowlands, Bardney Manor, Lincoln.*

— Potatoes crops with us are looking very well. No disease has made its appearance as yet, and early crops are turning out well, but they are later than usual. *D. Lumsden, Bloxham Hall Gardens, Sleaford.*

NORFOLK.—Potatoes are looking well. The yield at present is good in places. Late sorts at the field are running very much to haulm and the disease is making its appearance in places. *J. Forster, Hillingdon Hall, King's Lynn.*

— In this neighbourhood the crop is the best we have had for some years. All kinds have turned out well up to the present, and we have not seen any indication of disease. *F. Lee, Lynford Hall, Mundford.*

SUFFOLK.—Potatoes look remarkably well in this district, and bid fair to produce a most abundant crop, as the ground has lately had a thorough soaking, which will greatly assist the tubers in forming and swelling, and will render the land moist enough to carry them through. The only thing now to fear is the Peronospora, but as yet I have not seen or heard of a trace of it here or elsewhere. *J. Sheppard, Woolverston Park, Ipswich.*

— Early sorts are good in crop and quality; late kinds, where grown in open positions and on porous subsoils, look, at present, healthy and promising. In some low-lying damp spots blotched leaves are already prevalent, showing very like the disease. A return to bright dry weather is much to be desired. *J. Wallis, Orwell Park, Ipswich.*

— The Potato crops are clean and vigorous; they were generally cut down by the frosts about the middle of May, and came up later than usual. Tops have made extraordinary growth since the thunderstorms in July. Tubers watery, but free from disease. With dry warm weather Potatoes promise a yield above the average. *D. T. Fish, Hardwicke Gardens, Bury St. Edmunds.*

ESSEX.—Potatoes promise well so far. They were long in forming tubers. We could not dig from the early borders until the first week in July. We began with the old variety of Ashleaf, and are now digging Myatt's. We grew Sutton's No. 38 last year, and found it so good in crop and quality that we planted a lot of it this year; the Village Blacksmith was also of excellent quality. We have those two and Victoria for the general crop, and their appearance is all that can be desired; there is a lot

of Myatt's in the field with them, which are also excellent. *J. Douglas, Great Gearies, Ilford.*

— As a result of past rains, there exists around here an exceedingly robust haulm, the bloom upon certain varieties being very abundant and pretty to behold. Early varieties, both kidneys and rounds, taper but very slowly from want of heat. I note that young kidney Potatoes newly dug prove firmer when cooked than is customary during drier, and what are considered more favourable seasons. *W. Earley, Double House, Ilford.*

— Potatoes are looking wonderfully well—in fact, almost too strong. We have only lifted Ashleaf and Beauty of Hebron as yet, both of which have turned out well. I have not seen any sign of disease, nor heard of it. *A. Ooock, Havering Park, Romford.*

— The Potato crop is looking magnificent, and judging from what is being lifted daily, the produce promises to be the most abundant we have had for years. No signs of disease at present. *W. F. Bowman, Highlands, Chelmsford.*

#### MIDLAND COUNTIES.

BEDS.—The Potato crops are looking well at present, but the disease is making its appearance on the cold heavy land. A dry time would now be very beneficial to ripen the tubers. *G. Ford, Wrest Park, Amptill.*

— The Potato crop promises well. The tubers are large and excellent in quality. With plenty of sunshine the crop would be larger and better than we have had for many years. On the other hand, if the weather continues wet the blight will spoil it utterly. I have heard of the disease being observed in low-lying districts hereabouts, although I have not seen it myself. *W. M. Baillie, Luton Hoo Park, Luton.*

OXFORDSHIRE.—The quality of the tuber at present is not by any means in proportion to the haulm, which this season is unusually strong and healthy, showing a marked contrast to last year. Myatt's from the open borders are fairly good, and Early Rose—a kind much grown in this neighbourhood by the cottagers—are being dug as wanted, and in most cases are of good size, but immature. During the last week I have heard reports of disease from the heavy land in this district. In one case three or four bad to a root. On the lighter and drier parts the crop could not look better, and with favourable weather they promise an abundant yield. *G. Stanton, Park Place Gardens, Henley-on-Thames.*

BUCKS.—Potatoes are looking well at the present time. No disease visible on the haulm, neither have we found any diseased tubers yet, and the growth is all that can be desired. If favourable conditions prevail after now we may fairly anticipate having a bountiful yield. *G. T. Miles, Wycombe Abbey, High Wycombe.*

— This crop is looking remarkably well. No appearance of disease of any kind. Veitch's and Myatt's Ashleaf are our best earlies; for second early we find Snowdrop a fine variety; it cooks very white, and is always good, with very few small tubers. For main crop we grow M.P., which has been good here for two years past. *J. Smith, Mentmore, Leighton Buzzard.*

— The Potato crops are very late, but look well, and with dry hot weather the yield would no doubt be a good one. We are now lifting good crops of Veitch's Ashleaf and Beauty of Hebron. Later varieties not yet developed. Have seen no disease as yet, but it is reported in the neighbourhood. *C. Herrin, Dropmore, Maidenhead.*

HANTS.—Early kinds are generally very late this season, and the first liftings were very light crops of poor tubers. Early and second early crops now being lifted are turning out well—not large, but good crops of clean tubers, Snowflake, which we grow largely, being the best. Late crops are looking remarkably well in the fields everywhere, and of which there are several hundred acres grown in this district. Perhaps they are making a little too much haulm, sunshine being sadly needed just now for

them as a counter-action to the over-sodden growth. Disease is reported in a place or two, but I have not seen any signs of it myself. *J. Kipling, Knebworth Park, Knebworth.*

#### SOUTHERN COUNTIES.

BERKS.—Potatoes look very promising at present, but unless we soon have some warm sunshine and a few weeks drier weather, I fear for the crop on our rather heavy soil. The quality as yet is very inferior, American Earlies in particular being very watery when cooked. The best are the different varieties of Ashleaf.—*Midsommer Kidney* and *Sutton's Ring-leader* are also good. *W. Pope, Highclere Gardens, Newbury.*

— I am out of the Potato world. I do not like the monsters that the American varieties produce for us I am personally anxious for the disease to come, as I have some seedlings with which I want to prove as to resistance. Potatoes in this neighbourhood are too gross in the haulm. I hear of some rotten in damp clay soil—I do not like to dub it "the disease." I am still fighting with *Solanum Fendleri* and *S. tuberosum*. I have placed cuttings of the haulms of the latter to give me late flowers in the open ground to try and come in with *Fendleri*. *Robert Fenn, Sulhamstead, Reading.*

— Potatoes are looking well, and the crop is enormous on our Ashleaf Kidneys, the haulm on all varieties looking healthy, with a promise of an excellent crop, and Peas of all kinds have been very good and plentiful up to this period, although they filled slowly. Our rainfall, from July 1 to the 18th included, has been 3½ inches; out of that time we have had seven sunny days—all others more or less overcast, cloudy and cold, with rain, hail, and thunder. *T. Jones, Frogmore, Windsor.*

— A remarkably fine crop of tubers of uniform size. The yield, so far, is twice as good as that of last year. The field crops have a great number blank, some varieties being worse than others. *N. Sinclair, Easthampstead Park Gardens, Wokingham.*

MIDDLESEX.—I have delayed my report upon the Potato crops because small rumours have come to hand of disease appearances, but so far none seem to be serious, or, indeed, definite; amongst some of the earlier planted of the Rose family there may be found on very wet soils tops turning yellow or brown, or literally decaying; but that appearance seems to be as much due to the action of continuous cold and heavy rains upon a tropical plant, and especially upon some of the less robust forms, as to any other cause. With respect to the Potato crop generally, it never looked better than now, no matter whether the plots be of a few rods or of 20 acres. At the first the plants came through unevenly, but the moist condition of the soil soon caused amendment. Did warm weather ensue and the disease remain absent, we should have one of the grandest crops of Potatoes on record. Of scores of kinds all look well, and some very fine samples ought to be lifted during September. *A. Dean, Bedfont.* [Mr. Dean again writes, "Disease has now appeared." *Ed.*]

— Early Potatoes are good, and an average crop. Veitch's early Ashleaf, Covent Garden Perfection, and Myatt's have been very good, and free from disease. Late kinds look promising; *Sutton's Seedling* is remarkably good, and will, I think, prove a great favourite; *Magnum Bonum*, *Beauty of Hebron*, and other heavy cropping varieties look well, and do not appear, so far, to have suffered from the low temperature and excessive moisture we have had all through this month (July); we have seen no disease. *G. W. Wythes, Syon Gardens, Brentford.*

SURREY.—The early Potatoes are very fine, and capital in flavour; all other succession and late crops look very promising, but owing to the season being so late, and the continuous rains, it would be difficult to express a safe opinion on the amount of the crop at lifting time. *A. Evans, Lythe Hill, Haslemere.*

— Early Potatoes are the finest crop we have had for some years, and of excellent quality. Late varieties look remarkably well, and so far no ap-

pearance of blight. *J. Burnett, The Deepdene Gardens, Dorking.*

**KENT.**—Potatoes look extremely well, but almost too much haulm on main crops. Early sorts are turning out well in quantity when lifted, but exceedingly soft, especially Early Rose, and some of the larger kidney sorts. I have heard rumours of blight already, and am afraid it will become general should this wet weather last. *Wm. Craik, Hothfield Place, Ashford.*

—Potatoes are looking wonderfully well, and if dry hot weather should set in the crop will be immense. With the present weather every one is watching with the greatest anxiety. *H. Cannell, Swanley.*

—Potatoes are looking very well in this neighbourhood, both in the cottagers' small patches and in larger breadths. The tubers so far are sound and good, but late. With a rise in the average temperature and dry weather the crop is likely to be a tolerably heavy one. *G. A. Don, Belchbury Gardens, Hankhurst.*

**SUSSEX.**—We grow several novelties each year, weeding out those that do not satisfy us. Midsummer Kidney and Chiswick Favourite are this year our early sorts, but these are not up to our last year's standard, and the crop is fully a fortnight late. This is not surprising, as the last six weeks have been cold and sunless—just the weather to favour the Potato blight, although none as yet has been observed. I learn to-day (July 9) that some cottagers close by have had the disease in the tubers very badly. *H. R. Holmes, Ashburnham Place, Battle.*

—Potatoes are everywhere looking unusually well. Tubers from the open ground are fine; no blight has been observed as yet (July 10), and all garden varieties are looking most promising. As to later crops, it is rather early to know much about them; one thing, we want more heat. Vicar of Laleham, The Dean, White Elephant, Queen of the Valley, Beauty of Hebron, Prizetaker, Reading Russet, are all looking splendidly, and, to judge from their tops, I shall get a good crop, if the blight keeps off. All other kinds of root crops are looking well, as also Peas and other vegetables. This will prove to be one of the best seasons we have had for some time for all kinds of vegetables. *S. Ford, Leonardslee, Horsham.*

**HANTS.**—Potatoes are irregular in yield and the quality poor, the tubers being very soapy. The Midsummer Kidney is the best so far; even Myatt's Prolific this season is bad. Late varieties promise well. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

**HANTS.**—The Potato crops were never better, and at present (July 18) there is no appearance of the murrain. All are late, by reason of the extraordinary cold and wet state of the weather. The first to be ready for use was Sutton's or Fenn's Early Regent—the best flavoured and heaviest cropping early Potato in commerce. It is much superior to the several types of Ashleaf, and that much over-rated but popular market variety, Beauty of Hebron, is not worthy to be mentioned in the same connection. Vegetable crops are generally good. Early spring sown Cabbage, Cauliflower, and Peas I have never known to do so well. French and Runner Beans are late. We shall not gather in the open air till quite the end of the month. *W. Wildsmith, Heckfield Place Gardens, Winchfield.*

**WILTS.**—The crops of early and late varieties are very promising, and should we now get a spell of fine weather the produce will be plentiful and good; otherwise disease is sure to attack the crop. *H. W. Ward, Longford Castle, Salisbury.*

#### WESTERN COUNTIES.

**CHESHIRE.**—The early kinds of Potatoes are of good quality and size, Ashleaf being the best. Sutton's new kinds are looking wonderfully well, including Sutton's Seedling, Best of All, Satisfaction, and Masterpiece, which all turned out last year a fine crop of best quality, and which cooked well.

Many Potatoes are grown in this locality for market, viz., Myatt's Kidney and Sutton's Early Regent for early, Imperators and Magnums for late crops. Sutton's new kinds are being planted, but not in sufficient quantities for market purposes. As yet all the Potato crops are looking well, and I have not seen any disease. *J. Atkins, Tutton Gardens, Knutsford.*

**STAFFORDSHIRE.**—Early Potatoes in this district are rather later than usual, and what we have lifted at present are only a medium crop, and poor in quality owing to so much rain of late. Late ones are looking well so far, and with fine weather we should have good crops. *J. Wallis, Keele Hall Gardens, Newcastle-under-Lyne.*

**SALOP.**—Potato crops look remarkably promising; but the earlies turn out small in size and are late. Hundreds of tons of old ones are unsold in this district, chiefly of Magnum Bonum—one that is mostly planted hereabouts. Imperator seems to be growing into favour. Personally I prefer the Scotch Champion of all others for flavour, especially when roasted. *A. Kemp, Broadway, Shifnal.*

**WORCESTER.**—So far nothing better could be wished, for the crop of the early varieties is good, and the tubers well flavoured; the second earlies, such as Sutton's Seedling, Cosmopolitan, and others are very promising. We lifted some of the seedling for trial; they are beautifully white, of excellent size and shape, and, bar disease, will give a heavy yield. Late varieties all look remarkably well in the haulm, notably Sutton's Abundance and Vicar of Laleham. Magnum Bonum and Scotch Champion are grown on the home farm, and look equally promising. *W. Child, Crooms Court, Szeven Stoke.*

—Potatoes give great promise, but the protracted showery weather, with thunder, makes one fear an attack of disease. Early varieties are turning out excellently; Chanceller is one that ought to be better known for field culture, as it is a heavy cropper, and of the best quality. *W. Crump, Madresfield Court, Malvern.*

**HEREFORDSHIRE.**—Potato seed selected from prematurely ripened tubers did not come out of the ground evenly, but most of them have started, and the haulm at present looks well. I have noticed a little curl in gardens, but as yet—although the absence of sun and the low temperature have been favourable to the development of fungoid growth—I have not detected disease. I do not grow many sorts, but confine myself to those which do well upon our soil, eat and keep well throughout the season. We start with Mona's Pride, Veitch's and Myatt's Ashleaf, follow on with Covent Garden Market and Lady Paget—two grand second earlies, which keep good until May in the succeeding year, do not show their eyes, consequently are free from a particle of waste—no trifling matter in a gentleman's kitchen. My main crop varieties in the field are Magnum Bonum, Reading Hero, Reading Russet, Carter's Cosmopolitan, Lapstone, and Imperator. These varieties look well, and, having covered the ridges, a change to dry weather after these fine rains should result in heavy crops of tubers. *W. Coleman, Eastnor Castle Gardens, Ledbury.*

—Potato crops, of both early and late varieties, are looking remarkably well. The early varieties, owing to the cold spring, were a long time coming through the ground, and when through they had the drought to contend against through the month of May, but after the rains came they quickly made up for lost time. We are now digging the Early Hammersmith variety, the yield of which is fairly good, the tubers well grown, of fair size, and nice and firm when cooked. *A. Ward, Stoke Edith Park.*

**GLOUCESTERSHIRE.**—Potatoes of early varieties are digging and the late ones are looking well. Persons who were not careful to select good matured seed have bare places in their Potato rows. I have not heard one instance where the haulm was damaged by the spring frosts, and there is a possibility of late ones being dug earlier this season. Beauty of Hebron is the one we rely upon to come in before the late

crops, and Scotch Champion for field culture. *A. Chapman, Weston Birt, Gloucester.*

**MONMOUTH.**—Potatoes of the Ashleaf type, although later than usual, have nevertheless produced a prolific crop, the tubers being both numerous and large, and the flavour is good notwithstanding the wet and cold character of the season. Veitch's Ashleaf is a valuable variety, and we grow many of it. Second earlies and late varieties look well, their haulm being robust and foliage well developed. Field crops generally look promising, except those planted upon very tenacious soil. I have failed to find any trace of disease, but hear that it has been observed in this district. *T. Coomber, The Hendre.*

#### SOUTH-WESTERN COUNTIES.

**SOMERSET.**—Potatoes started evenly and strongly, but are now developing far too much haulm. The Ashleaf and other early English varieties have been plentiful and good in quality, but the American introductions are very inferior, especially as regards quality. Disease is also prevalent among the latter, and some of the early English varieties are slightly affected with it, and already the chances of an extra heavy crop is marred. *W. Igoulden, Marston House Gardens, Frome.*

—The Potatoes are looking wonderfully well throughout the county of Somerset, but there is rather too much haulm for a good crop to be general or likely, and the disease has appeared in some places. *W. Hallett, Cossington House, Bridgewater.*

**DEVONSHIRE.**—Potatoes are very fine, and excellent in flavour; these remarks refer to all early kinds grown here and in the district, and, judging from appearances, the later kinds will be very fine and plentiful. To-day I saw indications of disease in a small garden near the river. *G. Baker, Membland, Plympton.*

—Potatoes have, up to this date, in their tops shown unusual vigour, but fears may well be felt for their ultimate success, by reason of the excessive rainfall and low temperature, heavy fogs, &c., which have marked the past three or four weeks. Spots of the disease are showing daily in the leaves and stems of the plants, which will undoubtedly increase rapidly unless dry, sunny weather comes very soon. *James Easton, Wear House, near Exeter.*

—Potatoes have all done remarkably well. Disease made its appearance in the tubers of Beauty of Hebron quite a fortnight ago. Sutton's Magnum Bonum still retains its reputation as being the best late Potato, and free from disease. *D. C. Powell, Powderham Castle, Kington, Exeter.*

**CORNWALL.**—Both early and late varieties have grown very strongly. Traces of disease appeared in the first few days of July. Such sorts as Early Rose, Beauty of Hebron, &c., have now fully half of the foliage destroyed. I have found many diseased tubers among those we are lifting for use. None are yet fit for storing. *J. Murlon, Pencaltnick, Truro.*

#### WALES.

**PEMBROKESHIRE.**—The early varieties of Potatoes are a good crop, but much later than usual; the second earlies are a very heavy crop, and the late crops look very promising, although I have to report the disease having appeared here about the 5th ult. It had very severely attacked a bed of Ashleaves in a warm part of the garden. *G. Griffin, Sheck Park, Haverfordwest.*

**DENBIGHSHIRE.**—All varieties look healthy and strong. The early one is a good crop, but rather late. Late crops give excellent promise, and hitherto there is no sign of disease. Early Rose and Sharp's Victor yield heavy crops; Ashleaf varieties fair, and of fair quality. The Potato crop in fields over North Wales looks a healthy, regular, and even crop. The late rains, foggy, and warm sultry atmosphere will now try the stamina of the Potato to resist the disease. *P. Middleton, Wynnstay Gardens, Ruabon.*

—Earlies are a fair average crop, and of fair quality; they were rather later than usual, owing to the long continued cold weather during the months

of May and June. Late crops in fields and gardens have a promising look, and if the disease should not appear there will be a full crop. *J. Loudon, The Quinta Chirk.*

### IRELAND.

ARMAGH.—The Potato crop is looking remarkably well about here, with no disease apparent at present. Wet weather. *T. Sheehy, Castle Dillon.*

KILKENNY.—Early varieties are turning out a good crop, but owing to the incessant rains and want of sunshine, they are rather deficient in quality. Later sorts in fields are looking well, but want fine weather to mature the tubers. No signs of disease in the crop in this district up to the present. *W. Gray, Woodstock, Inistoge.*

DOWN.—Early Potatoes are turning out a good crop of fair quality; late varieties are now in full growth, and are looking well. No disease up to the present time. *J. Taylor, Mount Stewart.*

### CHANNEL ISLANDS.

SCILLY.—The early Potato crops were very late this season; digging in the open did not begin till the middle of May, by reason of the long prevalence of bitter cold east winds. Large quantities are grown on the island for the early markets, mostly Myatt's Ashleaf. The crop was, however, fairly good, and average prices realised. The crop of late kinds for winter use so far has looked very promising, but this week the disease is spreading fast. *G. D. Vallance, Tresco Abbey, Scilly.*

JERSEY.—Potatoes, as all know, are largely grown in these islands for the English markets. Last year it was a very paying business; the present season has quite reversed the order of things, and we question whether the crop will leave any balance at all. Two or three facts explain the whole position:—1st, unusual lateness of spring and early summer; 2nd, large quantities of old Potatoes being still held in England; 3rd, increased number of sources from which early supplies are now put on the English markets. In a general way it may be said the rainy days for Potato culture are past for these islands. Early crops have been good yields, and the late varieties are promising very well indeed. *Chas. Smith & Son, Caledonia Nursery, St. Heliers.*

—There is an abundant crop of Potatoes this season; the haulm, owing to the continuous rain, is strong, and the tubers large; the prices are low and unremunerative. *W. B. Saunders, St. Saviours.*

### THE SUPPLEMENT.

Our supplementary illustrations this week represent two very dissimilar plants, but equally worthy the attention of the amateur who has the means of growing them

#### RHOODENDRON ARGENTREUM

(for a photograph of which we are indebted to Mr. R. T. Newall, of Ferndene, Gateshead) is one of the many noble trees for which our gardens are indebted to Sir Joseph Hooker's memorable journey in Sikkim. The leaves are often a foot long, with their under surface of a silvery-white hue, so that even when out of flower the tree is very attractive. The flowers are white with a rich purple spot at the base.

#### DAHLIA IMPERIALIS

is one of those impracticable subjects which requires a house as big as the Palm stove at Kew to do justice to its merits. We remember on one occasion to have seen the difficulty as to space got over by laying the plant down when in bloom nearly parallel with the floor of the house; Consul Crawford of Oporto, being a resident in a warm-temperate, or almost subtropical climate, is able to adopt a better way, and the illustration we give (and for the opportunity of preparing which we are indebted to him) shows the success of his procedure.

*Dahlia imperialis* grows naturally in Mexico,

where it was found by Roetz, and first made known in the *Gartenflora* for 1863, then edited by our eminent friend, Dr. von Regel. The plant attains a height of 12—14 feet, and bears panicles of drooping, bell-shaped flowers, of a white or pale lilac colour. One of Mr. Bateman's sparkling "lectures" at the Royal Horticultural Society in 1870 was devoted to this plant, and to this zealous horticulturist and fluent exponent we are indebted for the introduction of this plant into this country. Mr. Bateman procured some tubers in the South of France, and bestowed them on the Royal Horticultural Society, so that Chiswick had the honour of being the first establishment (as we believe) in which this fine plant expanded its blooms in this country.

### THE APIARY.

The season may practically be said to be at end generally, and a disastrous end it is. A late, cold spring, followed by a wet and cold summer, is disheartening to the last degree, and though accustomed, as a rule, to look on the bright side of things, we cannot do so this year. Most hives, if not all, will most likely have to be fed up to weight for winter. About here hives are pretty full of bees, but of honey there is none. Many hives have already killed their drones, and some are even now casting out worker brood. Every bee-keeper knows what that means, and many have already begun to feed.

The only thing that remains is to hope that 1889 will be better than 1888. It is not too late to make artificial swarms while drones are about, but it had better be done very soon. As hives are mostly pretty well off for bees this can easily be done, but feeding must then be the order of the day to build the stocks up for another year.

Bees from Port Mahon, Minorca, have at last been successfully introduced into the apiary of Mr. Abbott, at Southall. Attempts have been made before, but have failed sometimes from postal regulations and sometimes from other causes. Sometimes the boxes have been opened by the postal authorities to see the contents, and when found to contain live bees have been hastily closed and the queen jammed to death. Mr. Andrew has sent these bees to many bee-keepers as a present. He promised us one, and no doubt we shall receive it in due course. These bees are said to be hardy, gentle, and prolific—good qualities, as every one will allow. To show how bee-keeping seems to be taking possession of the mind of the whole world, Spain (which cannot be called foremost in modern science) has issued a monthly periodical on bees called *Revista Apicola*, and Mr. Cowan's book has also been translated into the Spanish language. This work has been translated into nearly every European language, and the interchange of ideas thus circulated must soon make bee-keeping a prodigious industry. *Bee.*

### FORESTRY IN QUIANA.

WHITE CEDAR.—Those who have been much on the savannah aback of sugar estates are acquainted with the tree locally called White Cedar, belonging to the botanical order Bignoniacæ and the genus *Tabebuia*. It is found scattered here and there over the less wet parts of the savannah, and wherever a copse of woodland is found on drier ground it is more or less prevalent; and in the forests on the banks of the rivers that intersect the same region it is plentiful. The largest trees attain a height of 50 to 70 feet, and the trunk measures from 15 to 18 or 21 inches. The wood is more easily worked than is deal, and is serviceable for all kinds of indoor work in building. It is also useful as a furniture wood, and where lightness of material is required might be largely used. The grain is free, and it takes an excellent polish. Inquiries have been made for the timber for export, to be employed as match wood, for which purpose its lightness and free grain particularly adapt it. Resi-

dents on the rivers who use it in house building and for other purposes, and who are well acquainted with its qualities and merits, say that for use in building one of the principal of its recommendations is that it is never attacked by wood ants. If this be really so, it is a very great merit indeed, in a country like this where termites so much abound, and are so destructive to wood. The leaves are simple, about a span long, the flowers white; of the size and form of the *Bignonia* so common on fences and trees about Georgetown, and they are succeeded by finger-shaped pods that are densely full of flaky membrane-winged seeds. From specimens gathered by the writer a few months ago at Hoorooeba it has been figured in Hooker's *Icones Plantarum*, vol. viii., part 2, p. 1738, and named by Mr. Baker *Tabebuia longipes*, proving another of the many instances of very common plants that have awaited this late day to be scientifically made known. There are several species of *Tabebuia* in Guiana. Schomburgk, in the list in his "Reise in British Guiana," gives six:—*T. fluviatilis*, DC.; *T. latifolia*, DC.; *T. macrophylla*, Kl.; *T. ovata*, Kl.; *T. rufo-nervis*, DC.; and *T. triphylla*, DC., all of which are represented by specimens in the Kew Herbarium, where also is another under the name of *T. toxophora*. Among the plants gathered by Mr. Im Thurn at Koraïma was a new species, with three-foliate leaves and large white flowers, apparently of shrubby habit. This is named *T. roraima*, Oliv., and is figured in the *Transactions of the Linnean Society*, series 2, Bot., vol. ii., pl. 45. A plant that I gathered on the Kaieteur savannah (Nos. 830 and 1064) has obtuse-rounded leaves and fewer flowers than the White Cedar—features probably thus modified from the normal state of the latter by the poverty of the bare sandy savannah where it grows. *T. fluviatilis*, DC., is a five-foliate species, with clusters of white flowers, which grows in the form of a spreading bush, with its branches floating; it is very common on the banks of the rivers. This and the white Cedar I have introduced to Georgetown, where both are easily cultivated. *Demerara Argosy.*

### PLANTS AND THEIR CULTURE.

SOUTH AFRICAN AND OTHER BULBOUS PLANTS.—Considering the large number of this section of beautiful subjects, it is surprising how few are to be found in gardens, and, what is more, these are usually anything but representative of the genera. Probably the lack of success in growing the plants arises from treating them with other plants in a mixed collection. Most of the species possess but a small spread of foliage, and are therefore easily robbed of their proper share of light and air by their stronger growing neighbours; and unless special care be taken to guard against this evil, immature growths result, with the natural concomitant, lesser sized roots. It will, therefore, be seen that these bulbous plants should have either a special house or place to themselves. Select a position which affords abundance of light and air, both being conditions of first importance; indeed, even when in a resting state they are benefited by having a moderate supply, but in the growing season it is indispensable to the proper perfecting of their growth. Unripened growths not only fail in flowering well, but are more susceptible to disease, but sometimes the latter condition is brought about by attempting to get two seasons' growth in one year—or, rather, by keeping them more or less excited all the year through; this practice, unless great care is exercised, soon results in a debilitated condition, from which it is difficult to restore them. They have a period of growth, during which they should receive every encouragement until it is completed, and avoiding that kind of ripening which is brought about by suddenly withholding water; as, although the required quantity will gradually become less, yet the supply should always be sufficient to prevent flagging and ripening prematurely, which would prevent much of the elaborated matter of the leaves from being transferred to the storage cells of the roots. Although many of these South African and Australian bulbs have been for years in this country yet they do not readily adapt themselves to our seasons of growth; indeed, it is a matter of common knowledge that our autumn is concurrent with the spring-time of their native homes, and it is surprising

how pertinaciously these bulbous plants keep to their original seasons. Of course I do not mean to say that they cannot be forced out of their natural season, but if it is done it requires a considerable amount of skill and care to do it successfully. But even then, if the forcing is discontinued, they soon return to the normal time of starting, which is about August and September, consequently the present time would be most fitting to give the stock a general overhaul; besides, fresh importations of bulbs are now arriving, and could be conveniently incorporated with the collection.

In examining the collection, if the drainage is good and the bulbs not overcrowded, they need not necessarily be completely shaken out—merely remove the loose and inert soil from the pots, and top-dress with some light rich fibry loam to which has been added a mild and pulverised manure, or a pinch of some prepared fertiliser may be put on the surface of the old soil, and covered with the new soil. If the loam employed be inclined to be heavy some fibrous peat would be beneficial. In potting use rather deep pots, but not larger than would be fairly well filled with roots. If the pots are too large the soil is apt to get water-logged and soured—conditions very unfavourable to the welfare of any plants. The pots should be stood on or plunged in some moisture-holding material, and no more water given than is actually necessary to keep the soil in a moderately moist condition until the plants are fairly under weigh, and the pots well filled with roots. Most of these bulbs require the temperature of a greenhouse—some more so than others, such as those from the latitude of Natal; while those from the Cape do best in cold frames, viz., *Babianas*, *Isias*, *Spaxaris*, *Anomatheas*, *Trichonemas*, *Orthogalum* thryoides, the Australian *Calostemmas*, and such-like, may be instanced. Then there is a set which, while growing well in a cool temperature, yet like more head-room, of which section are *Watsonias*, *Antholyzas*, *Moræas*, *Gla-diols*, and *Albucas*. For the first group, 6-inch pots should be the maximum size used, but in the second group double that size may be used with advantage, provided there are plenty of bulbs to well fill the pots.

There is yet another group, which comprises the more strictly speaking greenhouse bulbs requiring something near to our summer temperature all the year round. And it is in this group that the most striking and beautiful subjects are found, whether it be the huge elephantine leaves and brilliant flowers of the *Illemanthus*, or the dwarf prettily marked foliage and flower-spikes of the genus *Lachenalia*—the tall inflorescence that arises from the great bulbs of such as *Brunsvigia* *Josephineæ*—the curious brush-like scape from the *Eucomis*, the showy flowering *Nerines*, as seen in *Nerine* (Rothergill) *curvifolia* and *serotensis*, the "Guernsey Lily," the elegant genus *Cyrtanthus*, and the terrestrial *Orchide*, *Lissochilus*, with their stately flower-spikes, are all distinct enough to be included in any one collection. A mild airy temperature, from 50° to 60°, during the winter and growing season, should be maintained. In summer, when they are at rest, with full exposure to the sun, protecting the bulbs from heavy rains, they may be stood out-of-doors until the nights become too cool for them, or they show signs of again starting into growth. *F. Ross, Pendell Court.*

## THE FLOWER GARDEN.

HARDY wall plants and climbers require close attention now, and ought to be looked over once a week at least. In training the plants avoid overcrowding, and cut out all weak and spindly growths as well as dead flowers, and in doing so keep a sharp look-out for insects and mildew. Examine such plants as were planted last autumn, and see that they do not suffer from dryness at the roots, for notwithstanding all the rain we have had recently it is quite possible for plants in certain positions to need watering by hand, and on that point it is as well not to be deluded by the state of the weather at any time between now and the end of the growing season.

Mixed beds and borders of hardy perennials have been particularly interesting and attractive this summer, as, in spite of the unpropitious weather experienced, their flowering has been profuse. Unremitting attention is required just now to keep them in good order. Where seed is not wanted the flower-stems should be cut off from the plants as soon as the blooming is over, but do not treat all things alike by cutting

the stems off at the base or within 2 or 3 inches of the ground. To adopt that practice with some species is tantamount to taking half the plant's life away, and giving it an unsightly appearance for the remainder of the season. For instance double flowered *Pyrethrums* ought not to be cut nearer to their crowns than from 12 to 15 inches, for the radical leaves are so few that it is only the stem leaves that give the plants anything like a presentable look till they die down in the autumn; not only that, but when the stems are cut close to the ground, it is impossible for the crowns to get properly matured for the succeeding year. *Delphiniums* may be left 2 feet long, *Aquilegias* and other plants that produce an abundance of radical or bottom leaves should have the stems cut down to the same level as the leaves.

Attend to late flowering species such as the *Michaelmas Daisies*, *Chrysanthemum lacustre*, *Pyrethrum uliginosum*, *Solidago canadense*, &c., which should be kept securely tied to stout stakes to prevent damage in windy weather and from thunderstorms. Keep the borders free from weeds, and do not trample on the soil in its present state any more than is absolutely necessary.

*Dahlias* should have the leaders tied to their supports as fast as growth is made, and at the same time cut out any weak and spindly shoots that may be growing out near the base of the plants. From this time onwards earwigs will be a great pest among these; a good method of trapping them is by placing at intervals beanstalks cut into 6-inch lengths and placed among the branches; these should be examined every morning. Small flower-pots with a little dry moss or hay inside, and placed on the top of the stakes, may also be used.

*Pinks*.—Cuttings of these that were put in pots and placed in a little peat as recommended last month are now rooted, and should be transferred to cold frames to harden off preparatory to planting out in beds at a later period. It is not yet too late to put in cuttings, but their propagation, if a stock of young plants is desired, ought not to be further delayed, and they should have the benefit of a mild bottom-heat. *J. Horsfield, Heytesbury.*

## THE HARDY FRUIT GARDEN.

WALL TREES.—All Pear, Plum and Cherry trees once more demand attention in the way of stopping and training of the shoots. The recent wet, sunless weather has caused the trees to make a quantity of weak, sappy growth without any of the young wood becoming ripened, therefore leave no more young wood than is absolutely required, spurbing back the breastwood and giving the shoots that are retained, and also the buds on the fruiting spurs, every chance of becoming properly matured, by admitting plenty of light and air. Tack or tie in the young shoots. The young growths on Morello Cherries require tacking in after which—if not already done—they should be netted to protect the fruit from the birds. Apricots will also want looking over and pinching in. With us the trees have lost but few branches this season by suddenly dying off, the Moor Park being a notable example, because it is a notorious fact that that variety is always the worst to do so.

General Work.—As soon as the nets can be removed from the Strawberry beds they may be transferred to the Currant and Gooseberry bushes, to protect the fruit which is required for late use. If they are not wanted they should be well dried and stored away. Before putting the nets over the bushes hand-weed the ground under and between them, for it is useless to attempt to hoe unless the weather changes. Old Strawberry plants which have done bearing, and which are not considered worth retaining, should be grubbed up, and the ground cleared. The same site may be manured, dug, and planted again if desired, but it is always better to have a change of ground. As the layered runners are now ready for setting out, preparations should at once be made, and the ground manured, dug, and allowed a few days in which to settle before the planting is done.

In selecting a site for Strawberries, it is always best to choose a piece of ground where the soil is of rather a heavy nature, but not too wet; but if such cannot be had, and the soil is of a light nature, the same can be made much more adapted for the purpose by applying a heavy dressing of good sound loam, which should be dug in, and well incorporated with the soil. For light soils a dressing of loam is far preferable to the application of large quantities

of manure. Soils of rather a heavy nature should be liberally, but not too heavily, manured, and even then a light dressing of loam is beneficial, especially if the staple soil is of rather a scanty nature.

Look over autumn fruiting Raspberries, and keep the canes tied to the wires, removing all suckers as soon as they appear above the ground. This latter detail must be well attended to, as the suckers rot the fruiting-canals.

The summer fruiting varieties should have the old canes cut away as soon as the fruit is gathered; and if not already done, the young canes should be reduced in number, leaving about eight or ten, which can again be thinned to the requisite number next spring. *A. Ward, Stoke Edith Gardens, Hereford.*

## THE KITCHEN GARDEN.

SPINACH.—A good-sized plot of this should now be sown for the winter supply; the prickly variety is the best for this purpose: it prefers a light warm soil in the winter, and a south border or similarly sheltered position should be given to it if possible, as a much heavier yield may be got by this means. If the soil is heavy and cold a good dressing of leaf-soil or charred refuse should be forked in previous to the sowing: it is best thinly sown in rows 18 inches apart, the young plants to be afterwards thinned to 4 inches apart.

Carrots.—A small bed of the Shorthorn varieties may now be sown on a warm border for use early in the spring before the forced ones are ready; the soil for these should be rather firm, or they will be drawn out by the frost in the winter; a good dressing of half-rotten leaf-mould between the rows about the middle of October will be of assistance in preventing this.

Tripoli Onions.—These generally succeed best if sown in beds in the autumn and transplanted to their summer quarters early in the spring; a good position and rather light soil should be given them now. The red-skinned varieties are the best in constitution, and are not so liable as the white kinds to be attacked by blight in the spring. In very cold and wet districts, where it is a difficult matter to get the White Spanish and similar varieties harvested by spring sowing, it is advisable to sow them in the autumn instead; they are equally as hardy as the Tripoli varieties, and are by this means ready to harvest several weeks sooner than if sown in the spring.

Earthing Celery.—This is best done in three times at intervals of a fortnight, and when the plants are perfectly dry. The main crop should soon be ready for the first earthing; all small leaves and shoots should first be pulled away, and the tops drawn lightly together with a piece of matting just under the green leaves; this must not be tied too tight, or in any position that will cripple the growth of the young heart of the plant, as it should remain on until after the second earthing. If worms and slugs are likely to be troublesome a good dressing of lime should be given before any soil is placed around the stems. If any more water or liquid manure is likely to be required it should be given a day or two before commencing to earth. If any heads are required for show it is well to wrap them round with brown paper before any soil is heaped against them. As a further preventive against discoloration by insects, &c., care must be used not to earth too deeply the first time; the young leaves should be able to continue their growth freely, the soil should be broken up small with the spade and pressed around the stems, the great point to aim at in order to have it well blanched and of good flavour being to exclude the air from the stems as much as possible, and this applies more especially to the later earthings. *W. H. Divers, Kelton Hall, Stamford.*

## TRADE NOTICES.

Messrs. W. & J. Brown, nurserymen, &c., Stamford, have purchased Mr. J. House's Eastgate Nursery, Peterborough, for £2000.

Mr. Robertson Munro, of the Abercorn Nurseries, Edinburgh, has taken into partnership Mr. R. B. Ferguson, late manager to the Lawson Seed and Nursery Company, and the business will now be carried on under the style and title of Munro & Ferguson.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Now ready, in cloth, 11s. 6d.

**THE GARDENERS' CHRONICLE,**  
Vol. III., Third Series, JAN. to JUNE, 1888.  
W. RICHARDS, 41, Wellington Street, Strand, W.C.

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETINGS.

MONDAY,	AUG. 13—Ghent Chambre Syndicale.
TUESDAY,	AUG. 14—Royal Horticultural Society; Fruit and Floral Committees.

### SHOWS.

TUESDAY,	AUG. 14—Claycross.
WEDNESDAY,	AUG. 15—Reading and St. Albans.
THURSDAY,	AUG. 16—Maidenhead, Ludlow, Aberdare, and Abingdon.
FRIDAY,	AUG. 17—Devon and Exeter, and Cheddar (two days).
SATURDAY,	AUG. 18—National Co-operative, at the Crystal Palace.
	National Carnation and Picotee (Northern Section), at Manchester.

### SALES.

MONDAY,	AUG. 13—Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	AUG. 14—Imported and Established Orchids, at Protheroe & Morris' Rooms.
THURSDAY,	AUG. 16—Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	AUG. 17—Second Portion of the Collection of Orchids formed by F. A. Philbrick, Esq., Q.C., at Protheroe & Morris' Rooms.
SATURDAY,	AUG. 18—Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

**The Potato Crop.** WE greatly fear that the weather of the last week will falsify much of the bright prospect that otherwise might have been indulged in from a perusal of our reports on the Potato crop. The dreaded disease, having been dormant for the last few years, bids fair to reassert itself this autumn with considerable severity. Should it be so, though it may seem hard to say so, we shall have in large measure ourselves to blame for it. Time was when we knew nothing for certain about the nature of the disease, and could only bemoan the results. At this period of profound ignorance theories innumerable were framed by those least competent to do so, and what was singular, by those usually most contemptuous of theories, and most addicted to proclaim the superior virtue of a peck of facts over a ton of theory. Times are changed. We do know now a great deal about the cause and nature of the disease—by no means all we should like to know—but at any rate we do not hear much now of wild theories, and cultivators have learned to accept as true what the microscopists have taught them,—that the disease is really due to the destructive action of a parasitic fungus. Some points in the life-history of the fungus are still matters of dispute, others are wholly unknown; but in any case we know enough to see that far greater good may be anticipated from measures of prevention than from any directly curative agency. Our reports show that the early varieties had up to the date of report almost entirely escaped. That is one hint, but we cannot grow all early Potatoes, and we shall have to wait some time before a truly resistant late variety is raised. We do not say it cannot be done, on the contrary we believe it can be accomplished, and that just as some Roses or some varieties of Peaches are far more seriously affected

with mildew than others, so certain Potatoes are much more subject to the disease than others—or rather, we should say, that where all are liable some suffer much more severely than others. It is for our cultivators carefully to note and record these facts—facts which the SUTTONS and CARTERS and other experimenters will to a certainty avail themselves of even more fully than they have hitherto done. Then, again, the present season gives an opportunity of testing the efficacy of the high moulding system advocated by JENSEN as a preventative. For two or three years a sub-committee of the Scientific Committee of the Royal Horticultural Society made elaborate experiments, and some of the members drew up still more elaborate reports on the experiments made at Chiswick. We do not say those reports were valueless, but at any rate they failed in their object—just because the fungus, though always present, did not spread much in those years. Moreover, as carried out, the cost of the protection would far have outweighed any advantage that might have been attained. Ample preparations were made for a state of siege; *sorties* were devised, and every preparation made to repel the invader, but the scouts had nothing to do, and the defenders had their labour for nothing. Prolonged experiments of this kind, undertaken by observers with no personal interests of their own to serve, could not be expected to be continued; the wonder is they went on so long; but the Royal Horticultural Society has always managed to secure somehow or other a willing band of assistants to do work for which other people would have to pay, and pay handsomely. At any rate, the sub-committee ceased their labours, and now the enemy so long waited for, and hopefully from one point of view, has put in an appearance. It is too late this season, even if it were otherwise possible, to repeat the elaborate precautions heretofore adopted at Chiswick, but a trial of the Jensenian plan on a small scale might be attempted without difficulty, and might still lead to valuable results, as although the haulms might be affected, the high moulding and bending the haulm might still preserve the tuber more or less.

Apart altogether from these measures, cultivators might accomplish much by doing their best to destroy affected haulm and tubers. We know that as a rule they do nothing of the kind—the haulm lies about in the fields, or finds its way to the manure heap to propagate the fungus in about the most favourable conditions possible; fowls and pigs eat the diseased tubers; growers send their produce to market with diseased haulm as packing at the top of the barrels, and consequently scatter the spores broadcast. People who do these things without an effort to prevent them, deserve to be considered enemies of the human race.

What may not be practicable on a large scale is easily effected on a small one; gardeners, and still more cottagers with small patches, should destroy affected haulm and tubers immediately, and not allow them to remain on the ground between other and healthy rows, day after day, as they do. They could not hope by such means to stamp out the disease entirely, but they would gain time, and save many a bushel which would otherwise be destroyed.

The application of sulphate of copper mixed with lime to the haulm and foliage in fine powder with a distributor would also be of service, but probably the cost would outweigh the advantage, if tried on a large scale. But whether or no, to allow the disease to spread, or rather to spread it ourselves, as we do, without making any effort to stay it, is a crime for which not only those

most responsible, but a still larger number of innocent victims have to suffer. Lastly, we may refer our readers to the account given of the Jensen plan in our columns on April 5, 1884.

**NATIONAL CONFERENCE ON APPLES AND PEARS.**—We have received the following publication:—

"In consequence of the great success of the Apple Congress in 1883, and the Pear Conference in 1885, and in order to bring up the reports then published to the present date, the Council of the Royal Horticultural Society has decided to hold another Conference on Apples and Pears in the gardens at Chiswick, from October 16 to 20 next.

"In the present Conference it is proposed to invite the exhibition of such varieties only as find favour, or may be considered thoroughly worthy of cultivation.

"One object of this Conference is to illustrate by facts and examples the present state and future prospects of commercial fruit culture in this country. It is consequently desired that contributors should endeavour as far as possible to furnish samples of fruits that are in favour in the markets of their several localities.

"All fruit growers are invited to exhibit, and the more widely the collections are procured (within the limits of the schedule), the greater the interest the exhibition will create.

"It is very desirable that every collection should be accompanied with as much information as possible with regard to soil, exposure, and physical condition of the districts in which they have been grown; for which purpose the accompanying forms are enclosed.

"All fruits exhibited should be distinctly labelled with the name or names under which they may be known, and as the specimens sent are strictly for examination, they must necessarily be at the disposal of the committee if required.

"Persons willing to contribute papers bearing upon the subjects in hand are requested to communicate with Mr. BARRON at an early date, stating the particular subject they are prepared to treat of. Arrangements for reading or publishing papers will be made by the committee.

"All packages should be addressed to Mr. A. F. BARRON, Royal Horticultural Gardens, Chiswick, and must be delivered on or before Monday, October 15. Exhibitors staging their own fruit may do so on the 15th, or on the morning of the 16th, to be ready for the inspection of the committee. Notice of intention to exhibit must be given to Mr. BARRON not later than Wednesday, October 10, stating the class or classes in which it is intended to exhibit, or the amount of space that will be required.

"All exhibitors will be admitted to the Gardens, free; and will receive a certain number of tickets according to the extent of their exhibits.

"It is recommended that heavy packages be sent by goods train.

### "APPLES.

"Not more than five large or nine small fruits to form a dish.

"1. Fifty varieties of Apples most worthy of cultivation.

"2. Twenty-four varieties of Apples best adapted to the exhibitor's district.

"3. Twelve varieties of Apples, do.

"4. Six varieties of Apples, do.

"5. Twelve varieties of dessert Apples.

"6. Twelve varieties of culinary Apples.

"7. Six varieties of dessert Apples.

"8. Six varieties of culinary Apples.

"9. Apples from cordon, bush, or pyramid trees (not to exceed twelve varieties).

"10. Apples from standards in orchards (not to exceed twelve varieties).

"11. Apples (not exceeding twelve varieties) grown on special stocks, of which particulars must be given.

"12. Apples as grown and sent to market, one peck of each (not to exceed twelve varieties).

"13. New, recently introduced, or little known varieties of merit.

### PEARS.

"Not more than five large or nine small fruits to form a dish.

"1. Thirty-six varieties of Pears most worthy of cultivation.

"2. Twenty-four varieties of Pears best adapted to the exhibitor's district.

"3. Twelve varieties of dessert Pears, do.

"4. Six varieties of dessert Pears, do.

"5. Three to six varieties of culinary Pears.

"6. Pears from trees on walls (not to exceed eighteen varieties) stocks to be specified.

"7. Pears from pyramids, bushes, or open cordons (not to exceed eighteen varieties) stocks to be specified.

"8. Pears from standard trees (not to exceed six varieties).

"9. Pears as grown and sent to market, 1 peck of each (not to exceed six varieties).

"10. New, recently introduced, or little known varieties of merit.

"N.B.—Staging must be completed before 12 o'clock on Tuesday, October 16. All fruit must be removed on Saturday evening, October 20, or on Monday, October 22."

# THE ROYAL HORTICULTURAL SOCIETY:

**TOMATOES AT CHISWICK.**—One of the most interesting, and at the same time singularly excellent examples of Tomato culture under glass, may now be seen in the large span-house in Chiswick Gardens, which was formerly devoted to Roses, &c. The plants comprise several hundreds in number, are all planted out, and include but few kinds, large blocks of each being grown to show general character. Not only is the culture, which includes absolute restriction to single stems, of the best, but the fruit production is truly marvellous; indeed, better examples of culture and fruiting have never been seen. The plants range from 4 feet to 8 feet in height, the taller growers chiefly being planted at the sides of the house, to run up the wires beneath the roof. In every case, no matter what the kind, the plants are fruiting literally from the ground, many fruits being already ripe. That some of the bloom, being late, refused to set, is due to the miserable weather we have experienced; but still some kinds, and specially a wonderfully prolific form, Horsford's Prelude, seem to have been unaffected. This variety runs tall, and fruits wonderfully, the fruits are handsome and of medium size, just such as would be most acceptable at table, although not large enough for exhibition. Also tall, and a wonderful cropper, is a distinct variety from Bath. Details of the varieties will be of more value later, but all interested in Tomato culture should see this remarkable show—a display of which the Royal Horticultural Society and its Superintendent may well be proud, for none better can be seen in the kingdom.

# DISSOCIATION OF HYBRID CHARACTERS.

One of the most interesting cases of this kind is that narrated by Mr. NOBLE in another column with reference to the white Jackman Clematis. It is so seldom that a rational explanation can be given of these so-called "freaks of Nature" (as if Nature the orderly, the methodical, ever indulged in caprice!) that such history as Mr. NOBLE is able to give us should be received with acclamation. He tells us that he has received one or two abusive letters, and that one Dutchman refused to pay. What sort of people are these? Why that little bit of authentic history that Mr. NOBLE tells is worth all the money the Dutchman declined to pay—ten times over. So far from being abused, Mr. NOBLE deserves the thanks of the community for a fine introduction, and the warmest thanks of the more appreciative for this solid help to the elucidation of a very obscure point in vegetable physiology.

**THE RIVIERA.**—We learn from our correspondents that the summer in the South is as exceptional as it is here, everything being about a month behindhand, owing to cool winds and low temperature. In July, near Mentone, the thermometer never once marked 70°, while at Antibes the mean temperature for July was only a little over 20° C. (68° F.), instead of 24° or 25° C. (77° F.).

**DAFFODILS.**—To show what manuring will do on light soil Mr. JENKINS (COLLINS, GABRIEL & Co.) has just shown us bulbs of the Tenby Daffodil weighing

about a quarter of an ounce, and others from the same original sample increased to 1½ ounce; and parent bulbs of Emperor with four and five offsets weighing collectively 12½ ounces. The bulbs are not merely large but of excellent substance and quality. The bulbs in question are grown in light soil to which a good proportion of dried cow-manure is added.

**DELPHINIUMS.**—From Mr. C. IRVINE, nurseryman, of Jedburgh, N.B., we have received (as briefly stated last week) some magnificent spikes of seedling Delphiniums, 25 to 26 inches in length, 8 to 9 inches in circumference, and one as much as 12 inches. The individual flowers were densely packed, and each large and of good form, of all shades of blue, from the palest cobalt to the deepest purple, tinged in many cases with a lilac sheen; in others the effect was heightened by the central petals forming a white eye.

**ARAUCARIA BRASILIENSIS.**—It appears that the tree whose portrait we gave some time since is growing in Jamaica, and not in Barbados, as we had supposed. Our photograph came from the late General MCKINNON when he was commanding the troops in the West Indies, and we must have mistaken his statement. The tree in question is well known in Jamaica where it is called the Jerusalem Candlestick. It was planted by WILES, who was botanist on the *Bounty*.

**THE "KEI APPLE."**—This, the fruit of a Bixaceous shrub named *Aberia caffra*, has ripened in the garden of Mr. HANBURY, La Mortola, Ventimiglia, and to whom we are indebted for the opportunity of seeing it. The fruit is of the size of a small Plum, spherical, downy, and apricot-yellow externally, pulpy within, with numerous ascending but inverted seeds, not unlike those of the Grape, but larger. The perfume is rich and heavy, but gives no indication of the flavour of the yellow pulp, which is as acid as that of a Lemon. The shrub is a native of the eastern districts of the Cape Colony and of Caffraria, where it is often used in the construction of fences, for which its spines render it well adapted. M. NADIN tells us that the tree is naturalised in various parts of Provence, but rarely produces fruit, owing to the flowers being unisexual. The late Dr. ANDERSON observed that a bush in the Botanic Gardens, Calcutta, produced ripe fruits, and, what is more remarkable, perfect seeds, although careful search failed to detect any trace of male flowers. The seeds from Mr. HANBURY's plant are perfect, the embryo being erect, embedded in perisperm, with two large flat appressed cotyledons and an inferior radicle. Male plants grow in proximity to the female ones.

**THE TUBEROUS BEGONIA.**—The proprietors of the *Gardening World* have determined on the issue of a series of manuals on various horticultural subjects. Their first venture is before us in the shape of a handbook on *The Tuberous Begonia: its History and Cultivation*. This is an excellent and appropriate subject for a beginning, and as far as we can tell from a cursory glance, it is well handled. We hope shortly to notice the work at greater length, but in the meantime we have no hesitation in recommending it to our readers. It may be had from the *Gardening World* Office, Catherine Street, Strand.

**BOTANY OF SOCOTRA.**—Professor BALFOUR's detailed account of the botany of Socotra has been published by the Royal Society of Edinburgh, and forms a bulky quarto of 446 pages and 100 lithographed plates. The preface contains a brief history and proceedings of the expedition, which lasted for forty-eight days only, but which was soon followed up by a second expedition by Dr. REEBECK and Dr. SCHWEINFURTH, and others. The plants collected by Dr. SCHWEINFURTH on this occasion were generously made over to Professor BALFOUR for use in the present work. The introductory chapter contains an account of the geographical and geological features of the island. The

low ground has approximately the same flora as that of the Sahara and Panjab. In the valleys in the higher ground tropical vegetation occurs. The higher altitudes have a strange and peculiar vegetation of arborescent Composites, aromatic Helichrysoms, and other quaint types. The total number of plants is given at 828, of which 575 are flowering plants, no fewer than 206 being endemic. The most showy plants are *Adenium multiflorum*, *Begonia socotrana*, now well known in gardens, and made already the starting point of various hybrids; *Crinum Balfourii*, *Exacum corallum*, &c. A Cactibaceous tree, *Dendrosicyos socotrana* is one of the wonders of the island; *Cocculus Balfourii* is also an erect shrub instead of a loose climber, like most of its congeners. *Punica protopunica* is remarkable for having only one row of carpels, and as being the wild representative of the common Pomegranate. The dragon's blood used in varnish making is the produce of *Dracena cinnabari*, nearly allied to *D. draco*. Frankincense and myrrh are also found, while socotrine aloes is yielded by *Aloe Perryi*, a species of *Buxus*. B. Hildebrandi may prove important as a source of Boxwood. The whole work is a striking proof of what may be accomplished by well-directed energy and instructed zeal in the course of a few weeks' exploration. The exploration and its record, as here given, are alike creditable to British science and to its representative, Professor BALFOUR.

**PENANG.**—We have before us Mr. CURTIS' Report on the Forest Department for the year 1887. Among the promising experiments mentioned in it, the culture of Patchouli is one of the most hopeful. An interesting account is given of a visit to the hill-dwelling of the Resident, Sir HUGH LOW, which is placed at a height of 4200 feet, and but for the excessive rainfall would be a delightful residence. The Resident has collected a number of European garden plants, which do fairly well.

**TRINIDAD BOTANIC GARDENS.**—Mr. HART's report for 1887 gives a summary of the history and present condition of the garden, its library, and offices. Such a report is specially valuable at home, while the practical details as to the cultivation and preparation of various fibres, food plants, drugs, &c. must be of great importance in the colony itself. The meteorological data also will be of use to home cultivators. The report is in every way creditable to the Superintendent, and affords promise of great future benefit to the colony, as well as to botany and horticulture. In connection with Trinidad we may also mention the publication of a *Bulletin*, of which No. 5 is devoted to Coffee, the report being based upon a treatise of Mr. W. SABONADIERE, of Ceylon. Trinidad has the means of producing Coffee equal to that grown in any other part of the world.

**PETER LAWSON & SON, LIMITED.**—From a report and balance-sheet just to hand we see that the surplus for the year is £1341 17s. 7d., leaving the sum of £3244 8s. 1d. as the total balance, out of which the directors propose paying a dividend of 7½ per cent. free of income-tax, carrying forward the balance (£2631 18s. 1d.) to next year's account.

**LITERARY.**—A new autumn edition of *Walks in Epping Forest*, by PERCY LINDLEY, describing portions less known to pedestrians, is in preparation. Professor BOULGER has contributed some notes upon the recent extensive tree-felling and "forestry" operations in Epping Forest to the same issue.

**PUBLICATIONS RECEIVED.**—*The Tuberous Begonia* (*Gardening World* series). Edited by B. WYNNE, F.R.H.S. (London: *Gardening World* Office, 17, Catherine Street, Strand, W.C.)—*The Fodder Grasses of Northern India*. By T. F. DUTHIE, B.A., F.L.S. Also *Illustrations of the Fodder Grasses of the Plains of North-Western India*. Part II. (Rorkee, India, Thomason Civil Engineering College Press.)—*Notes on Forest Management in Germany*. By Sir D. BRANDIS, K.C.I.E., F.R.S. (London: India Office, Whitehall, S.W.)—*A Practical Decimal System for Great Britain and her Colonies*. By K. T. ROHDE; 113th thousand. (London: EFFINGHAM WILSON, Royal Exchange, E.C.)—*Notes on the Cultivation of Dutch and Cape Bulbs, &c.* By ANT. ROOZEN & SON. (Haarlem, Holland: ANT. ROOZEN & SON, Overveen.)

## NOTES FROM EDGE HALL.

A few notes on plants now or lately in flower here may be of interest to some readers, especially as the hot dry summer of last year, and the drenching wet of July, have produced some remarkable effects. Himalayan plants do well in a wet summer; dry sunshine and parching winds always distress their flowers so in English gardens that I am accustomed to ask whether the mountain air of Nepal and Sikim is not constantly saturated with wet. I take *Meconopsis Wallichii* and *Cyananthus lobatus* as typical plants of the Himalayan climate. Both are better than ever this year; the flowers of the *Meconopsis* expand widely and healthily without the usual difficulty caused by the adhesion of the sepals to the petals, and the flowers last well; but the anthers seem to make no pollen; consequently I can never get good seed, and am dependent for plants on the generosity of friends; but all of them now make the same complaint, that no fertile seed is to be had. *Cyananthus lobatus* is an excellent rock plant, and always does well here in suitable places, just out of the direct rays of the sun. This year it has surpassed itself. There is no shyness about it. It keeps its multitude of beautiful blue flowers wide open day and night, whether it rains or not, but in wet weather the calyx fills with water and no seed is ripened. It is increased best by spring cuttings when the shoots are 2 inches long. *Codonopsis ovata*, another Himalayan, has less merit, but if it would show the beautiful interior of its hanging balls, and smell less foxy, it would be more attractive. The luxuriant growth of the *Androsaces* is everywhere attracting attention, especially *A. sarmentosa* which in many spots here presents a square yard of crowded large leafy rosettes. These, if their growth is not soon checked by planting them singly in a pot and getting them dried off by autumn, will all turn brown and be dead before the end of October. *Onosma tauricum* will do the same even sooner, many of my plants being drowned to death already, but the flowering of it has been very fine and abundant until lately.

*Heuchera sanguinea* is now a well-known plant: its flowers, which last a long time, give quite a new colour to the herbaceous garden. It is also very easily increased by striking the tufts. I doubt whether it will prove very hardy on cold soils if we get a severe winter after such a summer as this, but it is too good a plant to run the chance of losing by not keeping a stock in a frame. I lately saw a statement that it is the only *Heuchera* worth growing, but this is not so, the light feathery plumes of *H. micrantha*, though in quite a different style, are very ornamental, and one or two other kinds deserve a place in a mixed border, if only for their leaves.

The later-flowering *Gentians* are no worse for the wet: *Asclepiadea* and *Septemfida* are as good as usual. The large medicinal *G. lutea*, of which I have many plants raised from seed at least five years ago, has flowered here this year for the first time. Its associations give it interest, but it has little other merit as a garden plant. A new *Gentian*, *G. Weschnikowi*, sent to me in spring by Professor M. Foster, seems easy to cultivate. It is unlike any *Gentian* I have seen before, having flower-stalks of a curious fasciated appearance, carried up to a height of more than a foot by a series of bifurcations, with blue flowers the size of a harebell, the edges deeply and unevenly lobed. *Gentiana purpurea* is also flowering well. *Campanulas* have been and are very fine, the best of the large kinds being *persicifolia*. In nurseries we are offered all kinds of deformities of this beautiful plant, some having nearly flat flowers, or looking as if the bell had been turned inside out; others are in the shape of a cup and saucer; but the normal form, with the large handsome bell, is the best. Seedlings of this plant, which come up all over the garden, and are easily recognised, should be allowed to flower, as they present great variety of colour, from deep blue to pure white, some of the intermediate shades of lavender

being amongst the best. I should advise the same with seedlings of *C. turbinata*, though these rarely follow the habit of the parent, and degenerate towards the coarse growth of *C. carpatia*, but occasionally a plant of very good habit may be obtained in this way. I have by it a very dwarf plant with pure white flowers, not as large as those of *turbinata*, but very good for all that. I have tried to improve this plant by raising seedlings, but out of three crops not one plant has been worth keeping. Of yellow *Composites* *Coreopsis lanceolata* is perhaps the best, and no other *Coreopsis* out of six I have tried is worth growing in this soil, for I have given them a fair trial, except *C. grandiflora*, which I do not think is in cultivation in England; I always receive *C. lanceolata* under the name, though in leaf the two are quite distinct. Probably *C. grandiflora*, being from very hot parts, would not be hardy. For brilliant golden colour *Heliopsis lavis* is quite unsurpassed, though there are good and bad forms of the plant, some being too lanky for gardens. My best were raised from seed selected for me from wild plants in Minnesota.

*Senecio japonicus*, which has a synonym too long to write, is very showy, and seems to want a wet season to bring it to perfection. In dry weather it sheds its buds; both leaf and flower make it worth growing; it is very fine just now. Two *Sedums* are now especially good; one is *S. kamtschaticum*, perhaps the most showy of all the tribe at this season, and never shabby, the abundant and conspicuous orange flowers being succeeded by dark brown seed-vessels. The other is a scarce plant on rockeries—*S. pulchellum*, and produces large bunches, like inverted bird's feet, of flowers of a soft rose colour; but as its flowers from every point, it perishes if not propagated by breaking off and inserting shoots when young.

I will end these notes with a word about *Lilies*, all of which have done or are doing well this year, except *L. auratum*, which I have quite given up.

Last summer seems to have caused *L. giganteum* to flower while still young; I have had seven flower-stalks, mostly below the average in size, having from thirteen to eight flowers on each. On the other hand *L. pardalinum* is making some remarkable flowers: I measured a solitary flower to-day—I think on a seedling—which I caught just at the time of its greatest expansion, and which proved to be fully 8 inches across. The flowering of *L. testaceum* is also as good as I ever saw it. This is one of the few *Lilies* which is better for being meddled with. If the small bulbs which form on the crown of the large bulbs are taken away and planted by themselves they make grand flower-heads in two years, and surpass the old bulbs, which deteriorate if left alone for several years. *L. Humboldtii*, a capricious *Lily*, is making some very fine heads in the open border. The entire absence of red-spider from plants usually liable to it helps to compensate for the wet weather. *C. Wolley Dod*, *Edge Hall*, *Malpas*, *July 28*.

## VEGETABLES.

## LATE BROCCOLI AND EARLY CAULIFLOWER.

It is rather late now to talk or be writing of spring Broccoli, as the season is past for sowing, but it is a good time to compare notes now that the respective kinds have had a fair trial, although it should be borne in mind that sorts which did not turn in till the end of June this year may, and most likely will, do so considerably before that date next season, as everything has been quite a fortnight later than usual.

I have not, as yet, grown Gilbert's *Victoria*, noticed in a recent issue, and highly recommended therein, but I have most of the older varieties, and the best of them with us has been Veitch's *Model*, which does not belie its name, as it is the model of what a nice table Broccoli should be. In growth and habit it is very dwarf and compact, and the

heart is close, white, and slightly conical, and as the leaves fold tightly over, the heads are well protected, and therefore maintain their colour till quite ready to cut.

A Broccoli like this that will come in later will be even more valuable, as there is, unless under very careful management, always an interregnum between the last cuttings and the time when *Cauliflower* comes on; but with earlier sorts of these, which are now making their appearance, and later Broccoli, we may soon hope to bridge over the space. As the season for sowing spring *Cauliflower* will soon be here, a few words from some of your correspondents as to the kinds they have found the best will be of much value. My favourites are Veitch's *Pearl* and *Early Erfurt*, and as we cannot accommodate many under handlights, our practice is to put up a quantity in the autumn in 60-sized pots. This we do by putting a handful of half-decomposed leaves at the bottom of each pot, and then filling up with light rich mould, after which the plants are stood or plunged in cold frames with their heads well up to the glass, and they always have plenty of air during winter to keep them sturdy and strong. In March, as soon as the weather is favourable, they are planted out in a warm sunny situation, and as they receive no check by any disturbance of the ball or roots, they start off to grow at once, and it is very rare that any bolt unless sown before the middle of August. To succeed with these we sow a box in February, and place the same in gentle heat, and prick out the plants, when ready, under glass, and plant in the open in April. *J. S.*

## SCARLET RUNNERS FOR MARKET.

I have been much interested in the method by which Messrs. C. Steel & Sons, the well-known market gardeners of Ealing, grow their Scarlet Runners. In the first place, they give them good soil, and a piece of ground which had carried Collards and Curled Scotch Kale, was loosened by means of a stirrer worked by steam, which loosened the ground to the depth of 18 inches without turning it over as a plough does. This was done athwart the ground and longways, it was then harrowed, well manured, and ploughed to turn the manure in. When thoroughly prepared it was planted with Scarlet Runner plants. The Beans had been previously sown in dung pits, two Beans in a 48-sized pot, and when 9 inches or so in height they were planted out in lines, the rows about 4 feet apart, and the twin plants 2 feet apart in the lines. Then three strong stakes were placed to each plant—the stakes are about 4 feet or so in length, and they are tied together at the top. This done the plough was sent along the lines, earthing the plants up on either side. The ground being rich, and the soil moist, the plants soon began to grow rapidly, they have sent up shoots already 2 and 3 feet in length. The plants have bloomed, and still flowering freely, and pods are already formed. It appears to be the practice to pinch out the leading shoots after they have reached a certain height; this causes the plant to make lateral growths, which bloom. The extra cost incurred by clearing the plants in pots, and staking them, appeared to be met by the earlier and larger crops they produce; gathering is done without any danger of injuring the plants, and sun and air can circulate among them better than when nothing else is done, but simply pinching out the leaders. The cold rains have had the effect of causing the older leaves to turn yellow, and slugs and snails have attacked the plants. As a precautionary measure a good dressing of soot has just been given, shaken well over the plants, and on the surface of the ground. If only bright sunny weather were to follow, each group of Beans would present to view a dense pyramid of flower. No particular value appears to be attached to varieties, for the Scarlet, the Painted Lady, and the Giant White types, appear in the rows. The Painted Lady is said to be the earliest, and the Giant White the latest to bear; so there is perhaps an advantage in mixing them together. In another month this plantation, which is fully exposed on all sides, will well repay inspection. *R. D.*

## FRUIT REGISTER.

### HARDY FRUIT TREES.

THE admirable paper of Mr. F. W. Burbridge (p. 615, vol. iii., 3rd series), is too good to be marred by inaccuracy, however innocently incurred. As it is one of the papers that students of history will refer to, and has therefore a permanent value, I am tempted to offer a correction. "I believe I am right," says Mr. B., "in saying that our English Apples, as taken up by the earlier settlers in America, as also the fruits imported from France by the early colonists of Canada, did not succeed as it was hoped they would do, and it was only after the importation of the hardier varieties from Russia and other parts of Northern Europe, and the rearing of seedlings from these, that the present fine race of Apples in America was produced." Further on the point is made that "the Newtown Pippin does not thrive nor attain the flavour in Europe that it does in New England."

So far as I know—and I think I have been in a position to know—there have been no attempts during the period referred to to introduce hardy varieties of Apples from the North of Europe or from Russia, nor any attempt at all to improve the race of Apples by systematic rearing of seedlings. Within the last ten years Russian Apples have been introduced, but these have not had time to have any influence whatever on the race of Apples popular in America, if they ever will. With the exception of Alexander, Tetofsky, Duchess of Oldenburg, and Red Astrachan, we have no Russian Apple of any consequence known to cultivators, and these have not been used specially for seedlings. In looking over our list of popular Apples I do not note one that I can suspect of having had a Russian variety enter into their parentage. And the popular varieties certainly have not, but are either "English varieties," that is, varieties imported here from English nurseries, or accidental descendants—varieties that have sprung by accident from self-sown seeds, without the slightest design on the part of any fruit raiser to improve the race.

Let us take Canada, or at least that portion known as Ontario. The most popular Apples there that our pomologists in their technical language would "double star" are Baldwin, Northern Spy, Duchess of Oldenburg, Red Astrachan, Ribston Pippin, and St. Lawrence. The last is believed to be some foreign kind, introduced without a name, or name lost, and a new name given to it in consequence; the next three are Old World introductions, while Northern Spy is an accident found near Rochester; and Baldwin, another accident, found no one knows certainly where, but believed to have had the Spitzenburg for its parent—certainly no Russian kind.

In reference to New England—this is rather a large district, but if we take Massachusetts as a central point in this district we find the "double-starred" varieties are:—Baldwin; Cogswell, an accident found at Griswold, Connecticut, in 1798; Gravenstein, an old Dutch importation; Hubbardston Nonsuch, a very old accident found at Hubbardston, Mass.; Hurst Russett an accident found years ago at Concord, Mass.; Porter, an old accident found at Sherburne, Mass.; Red Astrachan, an ancient, full-blooded Russian; Roxburg Russet, a very old accident from its namesake Roxburg; and Rhode Island Greening, another accident (I do not even know where it was first found); Sweet Bough, a very old accident with an unknown home; Talman Sweet, a Rhode Island accident; and Williams' Favourite, another accident from near Boston.

Then as to the association of Newtown Pippin with New England, it is not grown anywhere there. Indeed it is no more reliable anywhere in America than in Europe. It is grown only in a small part of the State of New York, which is not in New England, and is not "double starred" even there.

I cannot say that, on the whole, the American chance seedlings, which go to make up our great list of varieties, are any harder than the foreign intro-

ductions. There are some that are undoubtedly harder, and more productive, and do better, in general terms, than their European brethren; but this may be expected when we have so many thousands of accidental plants to select from against the few score varieties introduced from the Old World. "Providence is usually on the side of the heaviest battalions," Napoleon used to say.

In Pears we have a few American seedlings that have risen to prominence; but European introductions, like Williams' Bon Chrétien, Duchesse d'Angoulême, Beurré d'Anjou, Winter Nolis, Belle Lucrative, Flemish Beauty, Vicar of Winkfield, and similar familiar Old World favourites rule also here. I trust my friend will pardon this essay at correction. He has evidently been misled by some flippant writer—a class of which here, as elsewhere, there is always a full crop. *Thomas Meehan, Germantown Nurseries, Philadelphia, U.S.A.*

## USEFUL INVENTIONS.

### SOCKET RINGS FOR HOT-WATER PIPES.

FROM Messrs. Stanley Morrison & Co. the patentees, 9, Gracechurch Street, London, E.C., we have received samples of moulded rough socket rings

FIG. 18.—INDIANRUBBER SOCKET-RING FOR JUNCTION OF HOT-WATER PIPES.

in indianrubber for hot-water pipes, for which the makers claim that they are superior to those at present in use, because they are stouter, being made in one piece, so that there is no joint to allow the water to enter; and that being round on the surface (not shown in the illustration, fig. 18), they get a good grip on the pipes. It is also stated that by using these rings any man can himself take his pipes to pieces and put them together again, saving both time and labour. This would, of course, necessitate the staying of the pipes in some manner to keep them firm.

### HOMERIA COLLINA.

This is a "Cape bulb," better known to our forefathers than to the present generation. Its general appearance is shown in the accompanying illustration (fig. 19), but the size and colour of the flower are subject to variation. In the present instance the flowers were of a bright orange-salmon colour, and although individually of short duration, yet, as they are produced in succession they are very effective in a mass. It is generally grown as a greenhouse plant, but Mr. Davidson, to whom we are indebted for the drawing (fig. 19), found the plant to be quite hardy last winter at the foot of a wall—a situation where, doubtless, many South African, Mexican, or Californian plants would be equally at home if protected from excessive wet.

## HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**MILNE'S PATENT SADDLE BOILER.**—It is in summer time usually that the nurseryman and gardener alike, who intend to make alterations in their heating apparatus, make arrangements accordingly. It need hardly be said that all such work should, where possible, be done at a time when the fires are least needed, and no time is so well fitted as summer and autumn. The large number of boilers now offered by the trade makes the matter of selection of a boiler for any given purpose a difficult one. In a great majority of cases the saddle boilers are decidedly in favour, and, having had an opportunity quite recently of inspecting a new form of saddle boiler, I may be permitted to point to some of the chief improvements in the new-comer. Before doing this it may not be out of place to remark that Mr. Milne, the inventor, is a nurseryman and a practical cultivator, carrying on business at New Hampton, in the county of Middlesex. The peculiarities of Mr. Milne's situation render it necessary to have a powerful boiler compact in form and one which does not require too deep a stovehole in which to set it. Having very extensive ranges of glass devoted to a few specialties for market purposes, heated by boilers of various descriptions, none of which were quite up to Mr. Milne's ideal of perfection, he very practically set to work to try if he could make what he wants for himself. The inventor chose the saddle form of boiler as the basis of his endeavours, the particular form being pierced with side and crown flues, which run through it from front to back. The direction of the flame is regulated as follows:—Passing first through the fire-box it passes through to the boiler; at the back of the boiler the flame is deflected by an iron plate at the summit of the back casting, and traverses the side flues, being then directed by means of another plate at the front of the boiler to the crown flues; again passing through the boiler to the brick flue at the sides, and thence to the chimney. The flue tubes passing through the boiler considerably quicken its power of getting up heat, and at the same time conduce to economy in the use of fuel. The flue tubes in the boiler are readily cleaned by passing a brush through them. The joints of these tubes are caulked from external surfaces at front and back, thus affording special facilities for repairs or renewal, any or all of which may be replaced without taking out the boiler. There are two return and two flow pipes, which facilitate the circulation, the latter being, moreover, materially assisted by the boiler being set with an inclination of 2 inches from front to back. It has the advantage of a terminal-end saddle, in that the fire passes throughout its entire length, acting also on the ends. The horizontally low-placed flues are an acquisition in places where water lies near the surface, as in Mr. Milne's case. In compactness and heating power combined, it is quite remarkable; and as at present made, with waterway backcasting, it is capable of heating from 2500 to 3000 feet of 4-inch piping, and when set is contained in a cube of 4 feet by 4 feet, this allowing ample rise through the long range of glasshouses. The inventor has two of these boilers in operation, affording perfect satisfaction, and which he will have pleasure in showing to any person who may desire to learn further particulars about them. *J.* [Our correspondent kindly accompanied his note by a sketch of the boiler and its flow and return pipes. We know that this form of boiler—a modification of that of the locomotive—has the advantage of quickly getting up heat. The retention of heat is a matter of stoking, which includes, of course, proper attention to dampers and ashpit doors. Ed.]

**HYBRID POTATOS.**—The products of the interesting crosses between some of the Potatos of to-day with the original species, *Solanum tuberosum*, which the Messrs. Sutton & Sons have carried out at Reading a few years since, may now be seen growing in the London Road Nursery grounds, and for the first time since their production, it would seem as if the disease-resisting properties of these Potatos were to be tested. The mischance which re-

sulted in *S. tuberosum* being fertilised under the belief that it was *Solanum Maglia*, has since been so far rectified that crosses with the latter species have been effected, and no doubt we shall hear of the results in due course. The top growth from the tuberosum hybrids, if such a term in this case be admissible, shows great variety in form and character, pretty much as is found in ordinary seedlings from some crosses. A marked feature, so far, with some of the forms has been remarkable productiveness. The great object in view, however, has been the production, if possible, of disease-resisting strains, and what success in that direction has been achieved will doubtless be learnt in a few weeks should the present cold wet weather continue. It is worthy of note as showing the very earnest aim of Messrs. Sutton to secure any promising aid in the direction named, that out in the trial grounds may be seen a considerable breadth of a Peruvian variety referred to by Mr. Ap-Thomas at the St. Stephen's Hall Potato Conference as having the reputation of being free from disease in its native habitat, and stock of which Mr. Ap-Thomas obtained for the Reading firm. Beyond remarking that the variety has tops resembling our common varieties, but the stems are densely abundant, nothing more is to be said about it just yet. Should the disease really develop a serious form in our Potato crops presently, renewed interest will be created in the Potato and all its belongings. *A. D.*

**CYPRIPEDIUM STONEI.**—At the fortnightly meeting of the Royal Horticultural Society, held on July 24 last, a *Cypripedium* was exhibited which is noted in these columns, at p. 108, as follows:—"Cypripedium *Stonei* acrocephalum, a flower pressed into the form of a flattened canoe, was shown by Messrs. Seeger & Tropp, of Lordship Lane, East Dulwich. The lateral sepals are here disjoined."

Messrs. Seeger & Tropp have been good enough to send me the inflorescence in question for examination, which seems to possess the following peculiarity:

The expanded flower has the two lateral sepals disjoined for three-fourths of their length, instead of being connate, as in the normal condition of the species. I do not, however, detect any other difference in the flower, all the parts of which appear perfectly developed. It appears to me to be rather a monstrous flower than a variety—really a case of dialysis of the lateral sepals as opposed to their normal state. This is the normal condition of things in the Canadian *Cypripedium arietinum*, which differs from every other species of the genus in this peculiarity—a character which has twice caused this plant to be separated as a distinct genus—first, by Rafinesque, as *Crisoanthus*, and afterwards by Beck, as *Arietinum*, though the difference appears to be too slight to merit such distinction. But this is a digression. I do not think the character likely to be permanent in the variety of *Cypripedium Stonei* in question, for in an expanding bud, just above the flower, the lateral sepals were in the normal connate condition. Some monstrosities, however, appear to have become fixed, or permanent, as *Uropedium Lindeni*, a monstrous state of *Selenipedium caudatum*; and *Pactonia rosea*, a similar state of *Spathoglottis plicata*. Cultivation alone can test the permanence or otherwise of these characters. *R. A. Rolfe.*

**WHICH IS THE EARLIEST PEA?**—I thought I was giving the information old gardeners would be among the first to appreciate when, taking King's leader and Improved Sangster's No. 1 as well-known type of early Pea, I saw no necessity for going into details over the many other reputed varieties of the same thing about which one was represented to be half an hour earlier than the other, or 3 inches shorter. The changes have been rung upon this type *ad nauseam*, and I imagined it was enough for me to state that certain of them having newer names were really our old friend re-christened; and I still hold the opinion that in the general characteristics of type the group of blue round-seeded varieties I mentioned cannot be differentiated from the general type of Sangster's No. 1. The soil in which the seed Pea was grown, the locality, conditions of weather, &c., may affect some; but let them be grown and the seed saved, and grown again a second year on the same piece of ground, and the general characteristics will be admitted to be identical. I mentioned the Old Scimitar because it is a Pea still largely grown in some parts of the country; and in Messrs. Surt & Sons' trial ground at Chelmsford I saw just what termed an improved type that seemed to me to present to view this old Pea of my boyhood in a desirable form, bearing long well-filled pods,

and appearing as a good hardy, robust, free cropping type, well adapted for market purposes. But there did manifest itself a tendency to run to a tall form, and I was candid enough to say so. Some conditions under which the seed-plants were grown might have caused this. I may further state that the trial of Peas to which I made reference included many hundred samples; there were from ten to twenty different stocks in some cases of the same leading variety. There seemed to be almost every Pea which has been sent out. I did not think it necessary to go through the whole of them with a view of supplying written descriptions. I was perfectly free to draw my own conclusions, and I did so, apart from any pressure or prejudice. I selected what I thought to be the most useful varieties, and the absence of anything like serious criticism justifies the inference that my conclusions are in the main correct. *R. D.*

**SPARROWS.**—Near large towns the common sparrow often becomes a perfect nuisance, for every gardener knows how industriously they will shell his Peas, and one farmer near Tunbridge Wells was so plagued with them in his Wheat fields, as the birds migrated from the town in a body, and took possession of his Wheat that he has this year sown—the bearded Wheat—which I understand puzzles their ingenuity, and is secure from their depredations. It will be understood that I am not blind to the fact that they ease us of many a caterpillar, but then they are in severe weather also fond of buds. Our Gooseberries were sadly disfigured by them till I adopted the plan of throwing soot over the bushes pretty freely in the spring; this kills the moss, and at the same time nourishes the bush; but although I have studied birds and their ways pretty closely for years, I was not prepared to see them feeding their young with Potato blossom—a fact which I witnessed last Sunday. I saw them in flocks in the cottage gardens, apparently divesting the blossoms of their petals, and carrying them to their young; the kind of Potato was a kidney, and was growing in very sandy soil, fully exposed to the sun, and thus probably contained a certain amount of honey—at least, this was the only explanation of the act of the birds which occurred to me. *J. Rust, Eridge Castle.*

**THE POTATO CROP EARLY AND LATE IN IRELAND.** This crop is second to no other in importance in this country, and the prospect therefore, is the question after the state of the weather every one asks every one else. This query has been asked with a certain amount of fear and trembling during the past three weeks as all the predisposing agents for the diffusion of the Potato disease were daily present. We had a constant downpour of rain, accompanied pretty frequently by thunder and lightning. Now, what is the result? I grow all the new varieties kindly sent me for trial, by such raisers as Messrs. Carter, Sutton, Laxton, Tait, and a few others in Ireland including one—White Fortyfold—sent me by Mr. Inglis, and as I frequently see, and hear from our districts, this is the result as far as I can learn at the end of the first week in August. Early varieties: The old Ashleaf, especially Myatt's, if it can be obtained pure, I consider still for quality unrivalled and the first to turn in. A heavier cropper and not much behind is Carter's First Crop. This firm sent me this season for trial their Earliest of All. I will only say of this if it maintains its present desirable characteristics it is the coming favourite early variety. Early Hammer-smith, Flourball, Pride of the Market, Snowflake, and Extra Early Vermont come second. Three weeks since I noticed the fungus on the Ashleaf Kidneys; so long as the weather remained dry it made little progress. Rain and storm supervened, and it spread rapidly, with the result that hardly a sound leaf is now noticeable in the experimental plot; and the same is true of the market gardens around the town. Their general early crop is a variety called The Flounder, so far as I know, not generally known out of Ireland. It is a heavy cropper, in shape roundish-dart (if that description is not an Irish bull), and far from superior in quality. One word as to quality. Owing to the absence of sunshine, constant rain, and rapid growth, the quality this year is inferior, and I think you would be safe in recommending only the partial use of some varieties, and if possible, with gravity or other such varieties are of limited importance. Late varieties: I mentioned above that the fungus first attacked the Ashleafs, it then spread rapidly to Snowflake, then Pride of the Market, and

Early Rose. In fact, in a wet season the American varieties are the first victims. Last season was very dry, and with no disease. I did not, as I mentioned in the *Gardeners' Chronicle*, see a single diseased tubers in any part of Ireland, so this induced many to grow Roses, Beauty of Hebron, Elciphants, and other varieties, such as Fortyfolds, Schoolmasters, and Victorias, known to be susceptible of disease, who would otherwise hesitate to plant them. They will in all probability be heavy losers, as I have come to the conclusion no variety is wholly disease resisting. For instance, I have Magnum Bonum, Sutton's Abundance, Laxton's Reward, Champions, and Scottish Queen, with five other varieties of Laxton's not yet in commerce, all unusable by strong vigorous growers, growing in plots side by side with the early varieties above-named. As soon as the early varieties got affected the disease passed in a day or two to those just named, so that now nothing remains sound but the stems. Curious enough, the majority of the same varieties out in the open field are still safe. There is hope so far. *W. J. Murphy, Clonmel.*

**HERBACEOUS PLANTS.**—Mr. Jenkin's doubts and difficulties seem to have arisen because the term herbaceous is still obstinately adhered to in schedules when all sorts of hardy border plants are invited to be exhibited. Of course many of the plants shown are, as a rule, not strictly herbaceous, according to the technical acceptance of the term, but those using the term in their schedules as a rule, doubtless desire that the appellation should not be too rigidly interpreted, and that it should rather include hardy perennials, and possibly even biennials, also, the object evidently being to obtain examples at shows of really hardy plants, as well as of greenhouse or stove plants. The best wording of such class would, I think, be "hardy border plants," and although it might be said that such wording would admit Roses or other shrubs, yet it would be easy to add, "shrubs and Roses excluded." Still, every body understands so fully what is meant by the term "hardy border plants," that little difficulty is likely to arise from this form of wording. Then there would be no question arise as to the admixture of either perennials or biennials, when the term "herbaceous" is employed all real perennials should be excluded, and yet it is very doubtful whether such be intended in any case. Happily, in garden nomenclature or treatment these diverse terms raise no difficulty, for, whether herbaceous, perennial, biennial, or otherwise, we class them as hardy, and that is enough. One of the gayest of border flowers just now is *Lilium candidum*, which, would doubtless, with other Lilies, be ranked as herbaceous, and yet really it is a perennial, because it is practically evergreen. The whole matter is, after all, but a mere word-splitting, and the compilers of schedules will do well to adopt simpler phraseology, and thus make clear to all that which should be as plain as a pikestaff. *A. D.*

**A LARGE LILIAM AURATUM.**—The enclosed is a photo of a *Lilium auratum* bulb which I supplied last autumn to a customer, the Rev. John Irving, Free Church Manse, Inverness, Scotland. He has today sent me a copy, and thinks it is an unusual sight to see so many flowers on a spike. It bears thirty-eight blooms. Each flower averaged 10 inches in diameter, and the whole head was 24 inches in diameter by 22 in height. Altogether the plant possessed a very compact and elegant appearance. *H. Erskine, Edinburgh.* [It is a large head, but we have seen larger ones; as, for instance, one grown in the gardens of the Right Hon. J. Chamberlain at Birmingham, which bore 119 flowers. See our columns for October 23, 1886. Ed.]

**CYCAS REVOLUTA.**—The following account of the *Cycas revoluta* which is now in flower in the gardens of John Hutton, Esq., of Solberg, North-allerton, may be interesting:—"The plant is about forty years old, the stem being 3 feet high, and 32 inches in circumference, with sixty-seven fronds; the flower or cone is 16 inches in length, and is of a yellow colour, much resembling a very large Pine-apple. This plant is a male, and flowered about fifteen years since, and after flowering the plant gradually went back by losing the fronds one after another until they were nearly all gone, when I found on examining the roots ten large crowns or young plants, which fully accounted for the loss of the leaves. I took them all off, potted them, and plunged them in bottom-heat, and all grew, but the parent plant did not seem to recover

the strain. I placed it as a curiosity in the Orchid-house, where it remained quite dead to all appearance for two years, when, to my surprise, the plant again showed signs of life by pushing several crowns at the top of the plant this time.

**A RESUSCITATION.**—During a terrific wind storm which occurred a few years since, when many noble trees came to grief, it will be remembered that mention was made of the downfall of some fine Limes forming part of a noble avenue of those trees

saye, with a body of helpers, and a stout winch or two, were obtained, the trees lopped to 30 feet—just one-third their original height—and were again stood erect in their former positions. The story of their replacement has been told before; but it may now be added, that each one has made vigorous growth, fine heads are being formed, and the only cause for regret is that 10 feet more of top had not been left on each tree. *A. D.*

**CYTISUS RACEMOSUS.**—In my note on *Cytisus racemosus* at p. 63 the following correction should be made:—"Maund, *Botanic Garden*, vol. v. t. 235," should read "Maund, *The Botanist*, &c." The mistake arose through the volume of the Kew copy of the latter work being bound up with the titlepage of the former. I did not detect the error until Mr. Burbidge wrote to point out something had gone wrong, when I discovered what it was. *R. A. R.*

## SOCIETIES.

### SOUTHAMPTON.

AUGUST 4 AND 6.—The Royal Horticultural Society of Southampton may be congratulated upon a very successful show. The competition was exceedingly keen, while the quality of the exhibits was good. Vegetables, as always is the case at Southampton, were especially a strong feature. Fruit showed somewhat the effects of the late bad weather by a greenness in most of the white Grapes, while most of the black Grapes were of good quality, as also were most other fruits, the quantity not being quite so great as on some previous occasions. Plants were an advance in point of number, while the general good quality was evident throughout.

**Plants.**—The principal class was that for twelve stove and greenhouse specimens, distinct, £18, £15, and £12, being offered as prizes. Mr. J. Cypher, nurseryman, Cheltenham, succeeded in carrying off 1st honours, with a collection particularly strong in flowering plants, while the foliage, if not of extra large proportions, was good in quality, the best being an exceedingly healthy *Latania borbonica*, *Cordylone indivisa*, *Cycas revoluta*, *Erica Parmentieri*, very full and fresh; *Phanocoma prolifera* Barnesii, and *Allamanda nobilis*. Mr. G. Lock, gr. to W. B. Cleave, Esq., Newcombe House, Crediton, was 2nd, his foliage plants being superior to those of the 1st prize group, but the flowering plants were not so strong a feature. Magnificent were the specimen *Crotons Warreni* and *Williami*. Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton, was a good 3rd. For the same number of plants, confined to gardeners only, Mr. J. Amys was 1st, staging extra fine *Allamanda Hendersoni*, *Trachelospermum jasminoides*, and a very healthy *Cycas revoluta*; Mr. N. Blandford, gr. to Mrs. Haselfoot, Moorhill, Bitterne, Southampton, was a good 2nd, staging a fresh good plant of *Lasiandra macrantha floribunda* among many other good specimens.

For six stove or greenhouse specimens in bloom Mr. Wills was 1st, the 2nd place being accorded to Mr. H. James, Castle Nursery, Norwood.

For nine miscellaneous specimens, not less than three to be in bloom, Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was an easy 1st, staging *Croton Queen Victoria*, good, and a good specimen of *Trachelium coruleum*; 2nd, Mr. W. Thompson, gr. to Captain Bolland, Blighmount, Millbrook.

For the best miscellaneous group, arranged for effect in 120 square feet Mr. Wills was an easy 1st, with a bright light tastefully arranged lot; the 2nd prize show from Mr. James being short of flowering plants, though otherwise well disposed.

For a collection of Orchids there was only one exhibitor—Mr. T. Osborne, gr. to H. J. Buchan, Esq., Wilton House, Southampton, who, however, made a good show, the most noteworthy plants being *Oncidium Jonesianum*, *Cattleya Schofieldiana*, *Epidendrum nemorale*, *Cattleya Dowiana*, *Oncidium Lanceanum*, and the new *Cypripedium bellatulum*. The same exhibitor took 1st prize for one specimen Orchid (not a made up one) with *Dendrobium Dearei*, carrying three spikes. With *Calanthe veratrifolia* Mr. Wills was 2nd.

For six Coleus, four Pelargoniums, four Fuchsias, and four double Begonias, Mr. G. Busby, gr. to F. Willan, Esq., Thornhill Park, Bitterne, was a good 1st. The best six stove or greenhouse Ferns—a healthy lot—were from Mr. Wills, who was closely

FIG. 19.—*HOMERIA COLLINA*: FLOWERS ORANGE-SALMON COLOURED. (SEE P. 161.)

instead of, as before, at the roots; but they were not so large. They continued to grow and send out two and three or more leaves to each crown, so I took them all off but one in the centre to form the crown again, which has continued to grow and forms the present beautiful specimen. *J. Nicholson, Northampton.*

in the grounds of Highfield, near Heckfield. The gardener, Mr. Davidson, thought that, although those trees had been thrown flat to the ground, and had, in bringing up huge masses of soil with them, torn asunder almost every root, yet they could be reinstated. Being on the Duke of Wellington's estate, the assistance of Mr. Bell, gardener at Strathfield-

followed by Mr. Amys. Six *Celosias*, naturally trained and freely flowering, were best from Mr. J. R. West, gr. to R. K. Wygram, Esq., Salisbury. Mr. Osborne was 1st for six *Fuchsias*, distinct, showing five plants 7 to 8 feet high; and he also led for a single specimen flowering plant, with *Cypripedium Sedeni*, carrying twenty spikes. Single *Begonias* were well shown by Mr. Blandford, with small plants of good habit and extra large blooms. In a brisk competition for six table plants Mr. E. Molyneux was 1st, Mr. Wills being 2nd.

Mr. W. Rogers, Red Lodge Nursery, Southampton, staged (not for competition) a capital collection of hardy shrubs, consisting of 150 plants of the best kinds; these being effectively arranged at one end of the tent, created a good effect.

Messrs. H. Cannell & Sons, Swanley, Kent, showed a collection of cut blooms of *Begonias*, and also plants of a double white variety named *Octavia*.

**Fruit.**—The leading prize for a collection of six dishes, distinct (Pine excluded), brought five competitors, all staging well. Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, easily secured 1st honours with Muscat of Alexandria and Black Hamburg Grapes; the former with good bunches, even berries, and fair colour, the latter medium-sized bunches of good quality, extra fine Hero of Lockinge Melon, and Goshawk Peaches. Mr. W. Allen, gr. to Sir G. Russell, Bart., M.P., Swallowfield Park, Reading, was 2nd; *Violette Peaches* and Lord Napier Nectarine, both being richly coloured, and a capital Melon, were his best dishes. Mr. E. Molyneux was a good 3rd.

For three bunches of black Grapes, Mr. C. Warden, gr. to Sir F. Bathurst, Clarendon Park, Salisbury, was awarded 1st honours among five lots with even clusters of Black Hamburg, good berries and well-coloured; Mr. W. Allen, 2nd, with bunches of good size, but rather loose, the berries good in size and colour; Mr. C. Curtis, gr. to J. T. Dixon, Esq., Hollybank, Hythe, took 3rd with larger bunches, but short of colour, both staging Black Hamburg. With three bunches of Buckland Sweetwater, of good quality, Mr. Molyneux was the only exhibitor of three bunches of white Grapes taking 1st. He again led for black varieties with Madresfield court of good quality.

For one Pine-apple, Mr. G. Lock was 1st, with a good Smooth Cayenne; Mr. Ward being 2nd, with a Queen.

The best scarlet-fleshed Melon came from Mr. J. Evans, showing a small fruit of Reed's Hybrid; and with Turner's Scarlet Gem Messrs. W. & G. Drover, nurserymen, Fareham, were 2nd. For one ditto, green-flesh, Mr. Ward, with Hero of Lockinge was 1st among seven staged; Mr. W. Sanders, with the same variety, was 2nd. For the special prize offered by Messrs. Sutton & Sons, Reading, for their Hero of Lockinge, Mr. Ward was 1st, with a capital fruit; Mr. J. Allen was 2nd.

For one dish of six Peaches, Mr. C. Curtis was 1st, with Royal George, rich in colour; Mr. J. Allen 2nd. And for the same number of Nectarines ten lots were staged; Mr. G. Inglefield, gr. to Sir J. W. Kelk, Bart., Tedworth, Marlborough, was 1st, having finely coloured though small fruit; Mr. E. Molyneux was 2nd, with Pine-apple. Six dishes of fruit, out-door growth, distinct, from Mr. J. Evans, were 1st—a good even lot.

**Cut Flowers.**—For twelve bunches of cut flowers, distinct, Mr. J. Evans was 1st, staging a capital lot, consisting of *Liliums Harrisii* and *lancifolium roseum*, *Magnolias*, *Imantophyllum*, and *Eucharis*; Mr. H. James was 2nd.

Mr. Molyneux had the best twelve hardy herbaceous flowers among five lots, showing well *Phlox Max Kolb*, *Rudbeckia laxigata* and *Trachelium coeruleum*; Mr. B. Ladhams, nurseryman, Shirley, was 2nd.

The best twenty-four distinct blooms of *Roses* came from Messrs. Keynes, Williams & Co., The Nurseries, Salisbury, a good lot, having regard to the time of year and the weather; Messrs. Perkins & Son, Coventry, were 2nd.

For twelve blooms, gardeners only, Mr. W. Clements, gr. to Mr. H. J. Gibbs, Poord, near Salisbury, was 1st, closely followed by Mr. Neville, gr. to F. W. Flight, Esq., The Cornstables, Twyford, Winchester. Carnations, Picotees, and zonal *Pelargoniums*, double and single, were fairly well shown by Messrs. Rebbeck & Busby.

Messrs. Keynes, Williams, & Co., staged, "not for competition," several boxes of *Roses* of good quality; while from Messrs. Pince, & Co., came seventy-two blooms of *Rose Niphetos*, and a large number of *Carnations* and *Picotees*. Messrs. J. Cheal & Son,

Crawley, Sussex, put up one box of pompon and one of single *Dahlias* of good quality.

**Vegetables** made a large show. The principal class was for twelve distinct (two kinds of Potatoes, round and kidney, allowed), which brought forth seven competitors, rendering the contest sharp. Mr. C. J. Waite, gr. to Col. the Hon. W. P. Talbot, Glenhurst, Esher, was placed 1st for a splendid lot, the best dishes being Reading Perfection Tomato, Ne Plus Ultra Runner Bean, Stourbridge Glory Potato, New Intermediate Carrot, Giant White Tripoli Onion, and Webb's Kinver Mammoth Bean; Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, was a good 2nd, staging capital produce, the most noteworthy being White Elephant Onion, the Duchess Pen, and Early Puritan Potato.

For nine varieties there were eight entries, the best coming from Mr. E. J. Cox, gr. to R. King Wyndham, Esq., Corhampton House, Bishop's Waltham, the Turner Hybrid Tomato, White Elephant Onion, and Duke of Albany Pea being the best; an exceedingly close 2nd was Mr. Molyneux.

For the prizes offered by Messrs. Webb & Sons, Mr. C. J. Waite took the lead with produce similar to that in his twelve prize lot; Mr. Pope again followed close.

There were nine exhibitors for four sorts of round, and four sorts of kidney Potatoes, six of each. Mr. R. West having the best, even, clean samples of leading kinds; Mr. Sanders a close 2nd.

For the best nine specimens of Sutton's Reading Perfection Tomato, for which the firm offered special prizes, Mr. Waite was 1st with even, large, and well-ripened fruits; Mr. T. Annells, gr. to T. J. Shenton, Esq., The Glen, Golden Common, Winchester, being a good 2nd.

The best Tomatoes staged were those of Hackwood Park Prolific, from Mr. W. Joy, nurseryman, Shirley. These were of extra good quality. Mr. Waite was 2nd among twelve lots competing.

Table decorations, bouquets, &c., were very fine on the whole, and the entries were numerous.

## ST. NEOTS HORTICULTURAL.

AUGUST 6.—This Society held its annual exhibition as usual on Bank Holiday, and was successful in all respects. It took place in a field in the centre of the town, and was attended by great numbers of people. The leading exhibitor of plants was Mr. Redman, gr. to J. H. Goodyames, Esq., Eynesbury; Mr. George Myers, gr. to the Earl of Sandwich, Hinchbrook, Huntingdon; Mr. Smith, gr. to Miss Cheere, of Capotown Hall, St. Ives; Mr. R. Carter, gr. to Lord Esmé Gordon, St. Neots; Mr. Thomas, gr. to Lord Esmé Gordon, St. Neots; Mr. Last, gr. to F. Day, Esq., The Priory, St. Neots; Mr. G. Warboys, gr. to Mr. Medland, St. Neots, &c. Mr. Redman's contributions greatly helped the show. Messrs. Wood & Ingram, Huntingdon, sent some stands of good blooms of *Carnations* and *Picotees*.

Cut *Roses* were a good feature. The Silver Cup, given by the President, A. J. Thornhill, Esq., Diddington Park, Huntingdon, for twenty-four blooms was won by Mr. E. B. Lindsell, of Huntingdon; Messrs. G. & W. Burch, of Peterborough, being a good 2nd. Mr. Redman had the best stand of twenty-four bunches of cut blooms, showing a very good lot indeed; and bunches of hardy flowers in twelves were a very good feature also. Hardy fruits were very fine. Vegetables, and especially Potatoes, in rare form. Farm produce was very interesting, and the schedule included prizes for song birds and other subjects of interest to country people. Large numbers of visitors came in from the surrounding villages. The success of the Society is mainly due to the acting Secretary, Mr. William Ratchelous.

## LIVERPOOL HORTICULTURAL ASSOCIATION.

AUGUST 4.—With few exceptions, and those of the character of *Dahlias*, *Gladioli*, &c., that are largely affected by the wetness and lateness of the season, this was a very fine exhibition. It was held in the Sefton Park. Plants (especially the foliage and ornamental ones) were surprisingly fine. Some plants of *Crotons*, and especially of *Queen Victoria*, were large in size, and brilliant in development. All the large plants were arranged on the grass.

**Stove and Greenhouse Plants.**—Several classes were devoted to these, and there were three entries in that for twelve specimens, six in flower; here Mr. James

Cypher, Cheltenham, scored a victory, having of foliage plants *Crotons* *Queen Victoria* and *angustifolius*, *Kentias* *Fosteriana* and *australis*, *Latania* *borbonica*, and *Cycas* *revoluta*, a magnificent *Erica* *depressa*, *E. Marnockiana*, *Kalosanthes* *coccinea*, *Phenocoma* *prolifera* *Barnesi*, *Stazione* *profusa*, and *Allamanda* *nobilis*—a very good dozen indeed; 2nd, Mr. A. Nicholson, gr. to W. C. Roberts, Esq., Highfield, Leigh, also with a very fine lot, having large specimens of *Kentia* *australis*, *Cycas* *circularis*, *Latania* *borbonica*, *Eucephalaros* *villosus*, *Crotons* *Queen Victoria* and *angustifolius*, *Dipladenia* *ambilis* and *profusa*, *Clerodendron* *Balfourianum*, *Isora* *Williamsii*, *Erica* *jasmiflora*, and *Allamanda* *cathartica*. Mr. Cypher also had the best six plants in bloom, Mr. A. Nicholson being 2nd.

The best eight plants four in bloom, came from Mr. B. Cornwall, gr. to T. S. Timans, Esq., Cleveley, Allerton, who had a magnificent *Croton* *Queen Victoria*, fully 8 feet through, grandly grown and coloured; C. Disraeli, *Phenocophorum* *sechellianum*, and *Gleichenia* *dichotoma*, *Erica* *Dixiana*, *Allamanda* *Schottii*, *Erica* *æmula*, and *Anthurium* *Scherzerianum*. 2nd, Mr. A. R. Cox, gr. to W. H. Watts, Esq., Ellen Hall, Waverley. Single specimen stove and greenhouse plants in bloom were also well shown.

**Foliage Plants.**—These were generally of large size and striking development, and made a fine display placed down the centre of the plant tent. The best eight came from Mr. J. Jellicoe, gr. to F. H. Gossage, Esq., Campfield, Woolton, similar in character to those already named; Mr. Cypher being a close 2nd. Mr. Cornwall had the best six—a very good lot; Mr. Cox being 2nd. Mr. B. Hall was 1st with three fine *Palms*, and Mr. W. C. Clark 2nd. Single specimens in three classes were also very good.

**Chicks** were shown in collections of four, and also as single specimens, the plants small but bright. Mr. J. Cypher had the best four; Mr. Henry Tate being 2nd. Mr. McIver had the best single specimens.

**Miscellaneous Flowering Plants.**—These included greenhouse *Ericas*, Mr. Cypher having the best three; *Fuchsias* in sixes and threes, generally old frames thinly clothed; single and double zonal *Pelargoniums*—good on the whole; Ivy-leaved *Pelargoniums*, large pyramid-trained specimens, needing sun-heat to get them into flower. Tuberous-rooted *Begonias*, very large, finely-grown, and bloomed specimens, of high quality: the best six were shown by Mr. A. R. Cox. *Gloxinias*, comprising some very good plants; *Achimenes*, *Petunias*, double and single, finely grown and flowered plants being the rule; and *Lilium auratum* and the varieties of *speciosum* were very fine.

**Exotic Ferns.**—The best eight were shown by Mr. Thomas Gowen, Wroesley Hall, Liverpool including good examples of *Davallia Mooreana*, *Dicksonia* *antipathetica*, *Adiantum Lindeni*, *A. assimile*, *Pteris scaberula*, *Gymnogramma peruviana* *argyrophylla*; 2nd, Mr. Cornwall, with well-grown plants of *Gleichenia dichotoma*, *Microlepia hirta* *cristata*, *Davallia filifens plumosa*, *D. tenuifolia* *Veitchiana*, &c. Mr. H. McIver had the best four, Mr. H. Tate being 2nd. Filmy and Tree Ferns, *Lycopods*, and hardy Ferns, were also good features.

**Caladiums and Coleus** were represented by medium-sized, well-grown, and bloomed plants, but the varieties were somewhat old.

**Groups of Plants Arranged for Effect.**—The groups at Liverpool were required to be of circular shape, and they are placed down the middle of one of the tents. The only exhibitor in the class to fill a space of 250 feet was Messrs. R. P. Ker & Sons, of the Aighurth Nurseries, who put up a faultless group, in which their richly coloured *Crotons* were specially attractive, and some plants of *Humea elegans* a fine feature. In that, for 150 feet, some very tasteful groups were set up, Mr. R. Cox being 1st, and Mr. Jellicoe 2nd.

**Cut Flowers.**—*Roses* were a leading, and a very fine feature. The best forty-eight blooms of *Roses* came from Messrs. Harkness & Sons, Bedale, who put up a very fine lot indeed, the crimson and scarlet H.P.s being conspicuous for their superb quality. Messrs. A. Dickson & Sons, Newtonards, were 2nd; and Messrs. R. Mack & Sons, Caterick Bridge, 3rd. Messrs. Harkness & Sons had also the eighteen Teas and Noisettes. Mr. T. B. Hall, Rock Ferry, was 1st, with twenty-four varieties; Mr. A. Tate, Woolton, a good 2nd. Mr. Hall also had the best twelve varieties. The best bloom of one dark variety was Ulrich Brunner, in remarkable character, from Messrs. Harkness & Sons; Messrs. A. Dickson & Sons being 2nd, with Marie

Baumann. The best twelve blooms of a light variety were Her Majesty, from Messrs. A. Dickson & Sons; Messrs. Harkness & Sons being 2nd, with Merville de Lyon. Prizes were also offered for the best arranged box of Roses, Fern fronds being also employed. Mr. T. B. Hall was 1st, and Mr. H. Pewtress 2nd. The best collection of eighteen varieties of stove and greenhouse flowers came from Mr. A. Heine, Manchester; Trentham Gardens supplying a remarkably good 2nd. Hardy flowers, shown in bunches of twenty-four and twelve, were good and numerous. Pansies, Carnations and Picotees, Dahlias, &c., were below the average.

**Bouquets and Vases.**—Messrs. S. Perkins & Sons, Coventry, had the best two bouquets; Mr. A. Heine being 2nd. The latter had the best in the class for one, and also the best epergne; but the stands in this class were scarcely worthy of Liverpool. Bouquets of wild flowers were a good feature.

**Fruit.**—Of this there was a satisfactory display, the bunches of Grapes were very fine, but lacked finish owing to the absence of sun-heat. The best collection of eight dishes came from Mr. R. Daves, gr. to the Hon. Mrs. Mervill-Ingram, Temple Newsam, Leeds, who had Madresfield Court, and White Muscat Grapes, Royal George Peaches, Lord Napier Nectarines, Figs, Strawberries, &c.; 2nd, Mr. W. Pratt, The Gardens, Longleat, Warminster. Mr. T. Elsworth, gr. to A. R. Gladstone, Esq., Court Hay, had the best six dishes—a good lot; and Mr. D. Lindsay, gr. to Sir T. Edwards-Moss, Otterspool, being 2nd.

The best Pine-apples in both classes, came from Trentham Gardens.

Mr. R. Pilkington, Liverpool, had the best four bunches of Grapes, staging fine examples of Black Hamburg, Madresfield Court, Muscat of Alexandria, and Buckland's Sweetwater. 2nd, Colonel W. W. Pilkington, Roby Hall, with Buckland's Sweetwater, Foster's Seedling, Black Hamburg, and Madresfield Court.

Black Hamburg, Madresfield Court, Muscat of Alexandria, Foster's Seedling, and Buckland Sweetwater were the leading varieties in the classes for two bunches. Peaches, Nectarines, Melons, and Strawberries were also good.

**Vegetables.**—It must suffice to say that these were numerous and very fine, Potatoes being a great feature. Messrs. Sutton & Sons' special prizes for six distinct varieties of vegetables brought a very keen competition.

**New Plants.**—First-class Certificates of Merit were awarded to Messrs. R. P. Ker & Sons, Aigburth, for Crotons aigburthensis and Aigburth Gem, two narrow-leaved varieties of great distinctness of character, the latter being brilliantly coloured; and to Messrs. H. Cannell & Sons, nurserymen, Swanley, Kent, for white Begonia Octavie, the blossoms of which are like those of a Gardenia, and singularly pure.

**Miscellaneous Contributions.**—Among these was a group of decorative plants, and three large circular groups of Roses in pots from the Liverpool Horticultural Company (John Cowan), Limited; a group of Crotons and other stove and greenhouse plants, from Messrs. R. P. Ker & Sons; a large collection of Ferns, from Messrs. W. & J. Birkenhead, of Sale; plants, wreaths, &c., from Messrs. Jones & Sons, florists, Liverpool; cut Begonias, &c., from Messrs. Rodger McClelland & Co., Newry, Ireland; cut bloom of zonal Pelargoniums and single and double Begonias, from Messrs. H. Cannell & Sons; and a group of plants, and also cut flowers, from Messrs. Dicksons, of Chester, all of which were highly commended.

Great praise is due to Mr. E. Bridge, the Secretary, for his excellent arrangements, but the rain, which fell all Saturday afternoon, prevented many visitors from witnessing the exhibition, and it is feared a financial loss will accrue to the Association.

## ROYAL SCOTTISH ARBORICULTURAL.

THE thirty-fifth annual meeting of this Society was held in the class-room of the Royal Botanic Gardens, Edinburgh, on the 7th inst., Mr. Malcolm Dunn, the Palace Gardens, Dalkeith, in the chair. On the motion of the Chairman, the Earl of Hope-toun was elected President of the Society.

The Chairman, in his opening address, glanced at some of the more prominent topics of the day in connection with forestry. Looking back to the year 1854, when the Scottish Arboricultural Society first saw the light, they might, he declared, say that the forestry of the present time was, like the Society,

then in its infancy. In 1854 their esteemed President, Dr. Cleghorn, was engaged in working in the midst of his busy official duties, that great system of forest conservancy which he began to put into execution two years later, and which at the present time was such a remarkable feature in the economy of the Government of India, and so full of promise in the future of that magnificent country. In that same year the Society was instituted by a few able and enthusiastic foresters, with a view to promote a better knowledge of the science and art of forestry, and the adoption of better methods for the management of their woods and forests. Following up the scheme thus laid down by the pioneers of 1854, the Royal Scottish Arboricultural Society had diligently persevered in the path so well laid out for it, and had striven by every legitimate means to foster a love of the profession among its members, to promote a correct knowledge of the various systems and details of modern forestry, and especially to establish for young men a suitable education and the best possible method of training, to qualify them for carrying out with credit and success the many important functions of a forester. The Chairman then recalled the part taken by the Society in organising the Forestry Exhibition of 1884, and afterwards gave an outline of the proceedings of the Parliamentary Committee on Forestry, which resulted in a recommendation that a Forest Board should be created by the Government with the view of establishing schools of forestry throughout the country. It was believed that such a Board would be formed in connection with the new Department of agriculture which it was the intention of the Government to institute. The Royal Scottish Arboricultural Society would be entitled to a representative on that Board, along with other kindred societies, and if the various bodies took care to elect really efficient representatives, they might look forward with confidence to the establishment of proper institutions for the training of all grades of foresters that the necessities of the country might require to come and abroad. As to the prospect of foresters receiving remunerative employment after they had fully qualified themselves for their profession, he said he had looked into that aspect of the question with some care, and it appeared to him that there would be no lack of employment for all duly qualified men, and that the remuneration would be at least equal to that received in any other profession in qualifying for which the same amount of time and money had been expended. The owners of large estates were every day becoming more alive to the fact that their woods and waste lands must be managed with the best skill and intelligence, so as to make them a permanent and valuable source of income, instead of the worthless burden they had been in the past. There were about 12,000,000 of acres, nearly all included in the large estates of the United Kingdom, the annual value of which did not exceed an average of 1s. 3d. an acre. Allowing a deduction of one-third for high altitudes of land unsuitable for the growth of forest trees, there still remained 8,000,000 of acres of land which might be covered with forests to the mutual advantage of the owners and the benefit of the country. Land at annual value of 1s. 3d., or, adding the value of the one-third deducted, as useless for growing timber—say, 1s. 8d.—could not be of much use for grazing purposes. After it was once planted it would in all probability afford as much grazing for stock, except under Pines and Spruces, under proper regulations, as it had furnished before being planted, and it would give far better shelter and cover for deer and other game, which would still be a source of considerable income. The greater portion of this land, lying at an altitude of 300 to 1500 feet above sea-level, was well adapted for the growth of forest trees, and only required to be properly laid out, planted, and managed by duly qualified foresters to quadruple at least the annual income derived from it, after paying all expenses and allowing for all contingencies. In addition to all this, the working of the forests and the manufacture of their products would supply well-paid work to a larger rural population than now inhabited those districts, and would thus help to solve one of the greatest social problems of the day—how best to retain in rural districts a happy and industrious working population. Nor was there the slightest danger of overstocking the country with forest, even if all these 8,000,000 acres were planted. The total area now under woodlands in the United Kingdom was about 2,788,000 acres, the smallest proportion to the total acreage of the country that was to be found in any well-regulated European

State. With the 8,000,000 added, the woodlands would only cover 14 per cent. of the total area, a proportion which was exceeded by several of the northern countries in Europe. There was thus a sufficient field for a greatly extended system of forestry in this country and a consequent demand for well-educated and trained foresters. The owners of the land might have the will to enter on those extensive enterprises, but some of them might not have the means. That difficulty could, however, be met, either by Government loans or by forming public companies to supply the money.

**Awards for Competitive Essays.**—Mr. D. F. Mackenzie, Morton Hall, submitted the report of the judges on the competitive essays, the following being the awards:—"Report on the Giant Thuya"—Bronze Medal, A. D. Webster, Hollydale, Holwood Park, Kent; "Report on the Old and Remarkable Trees of Holwood"—Silver Medal, A. D. Webster; "On the Comparative Value of Exotic Conifers as Ornamental or Timber Trees in Britain"—No. 2 Silver Medal, A. D. Webster; "Landscape and Economic Planting"—Bronze Medal, Charles S. France, Ash Cottage, Bridge of Dee, Aberdeen; "Botany of Hampshire"—Bronze Medal, John Smith, surveyor, Romsey, Hampshire; "Old and Remarkable Trees, with Photo Album"—No. 1 Silver Medal, James Barrie, forester, Stevenstone, Torrington, Devon; "Plans and Specifications for the Erection of Foresters' Cottages"—No. 2 Silver Medal, R. B. Keay, forester, Redcastle, Ross-shire; "On the Comparative Value of Exotic Conifers as Ornamental or Timber Trees in Britain"—No. 1 Silver Medal, Thomas Wilkie, Tynninghame, Prestonkirk; "Report on the Advantages of Forming Belts of Plantations on Hill Pasture Lands"—Bronze Medal, Thomas Wilkie; "Report on the Rearing of Underwood for Game Coverts in High Forests"—Bronze Medal, Thomas Wilkie; "The Best Approved Collection of Dried Specimens of Leaves of Hardy Trees"—George Dodds, Wentworth, Rotherham.

**Forest Board.**—The Chairman invited suggestions as to the appointment of a representative on the Forest Board, which, it was hoped, would be established this year in connection with the proposed new Department of Agriculture.

Dr. Cleghorn said he would much have preferred that forestry education should have been kept separate from agriculture. It was a very important matter, and he thought the Parliamentary Committee might have given a stronger expression of opinion than they did; but so far as their report went, it was in a right direction.

Mr. James Watt, Carlisle, while looking upon the proposal to appoint a representative as premature, thought there could be but one opinion as to the gentleman who should be selected when the time came. He hoped they would, when the appointment became practicable, send Dr. Cleghorn to the Board.

**The Universities Bill and the Botanic Gardens.**—The Chairman stated that the Council had petitioned Parliament against the clauses in that bill transferring the Botanic Gardens from the Crown to the University, and desired the meeting to give an expression of its opinion on the matter. Mr. McKenzie, Edinburgh, said the proposal of the Government was injurious to foresters, gardeners, and the public at large. The gardens were invaluable as a source of technical education, and he urged strenuous opposition to any change that would impair their usefulness.

Professor Bayley-Balfour said he was of opinion that it would be a mistake to transfer the garden, not only in the interests of the garden itself, but in the interests of the general public, of the University, and of scientific and general education. The only reason given by the Treasury for the proposal was that it wanted to get rid of the expense of both the Arboretum and the Botanic Garden. The Arboretum, however, was not included in the bill, so that the Treasury would still have to keep it up. No one wanted the change, and he was glad to see that the public were moving earnestly in opposition to it.

**Visiting the Arboretum and Inverlich Nurseries.**—The business of the meeting over, the members were conducted around the Arboretum by Mr. Lindsay, Curator, Botanic Gardens. The various groups of trees and shrubs, which are arranged chiefly in their natural orders, were inspected with much interest. The party then proceeded to inspect the several Inverlich nurseries belonging respectively to Messrs. Jas. Dickson & Sons, Messrs. Thomas Methven & Sons, and Messrs. R. S. Robertson & Co. Mr. John Methven directed the attention of the party to the

distinction between the Tyrolean and the native Larch, in a fine quarter of two year seedlings of splendid growth. Growing side by side the difference was very remarkable, the foreign being much less vigorous and darker in colour than the native.

On leaving the Inverleith Nurseries the Warriston Nurseries of Messrs. Methven & Sons were next visited, and the valuable stock of ornamental shrubs and trees inspected with interest.

*The Dinner and Presentation to Dr. Cleghorn.*—The annual dinner of the Society was held in the Waterloo Hotel, in the evening, and advantage was taken of the occasion to present Dr. Cleghorn with his portrait, which had been subscribed for by his numerous friends in appreciation of his eminent services to arboriculture in this country and in India. The chair was occupied by Professor Bayley-Balfour, and Mr. Dunn, Dalkeith, acted as croupier.

### THE SCOTTISH HORTICULTURAL ASSOCIATION.

THE ordinary monthly meeting of this Association was held on the 7th inst., in 5, St. Andrew Square, Mr. McKinnon, The Gardens, Stone Palace, in the chair. The Secretary, Mr. Robertson Munro, read the petition to Parliament, agreed upon at the extraordinary meeting of the Association, reported in our issue of last week, against the proposed transference of the Botanic Gardens, Edinburgh, from the Crown to the University authorities.

The petition was unanimously approved of.

Mr. W. Sutherland read a paper on "The Functions of Horticultural Societies." Assuming that the machinery for the working of horticultural societies established by the leaders of horticultural movements two or three generations back could not be much improved upon, he yet thought it was possible and desirable to introduce more elastic methods to widen the scope of usefulness of societies, so that their work might meet the requirements of modern conditions. Something was being done in this way by such as the Scottish Horticultural Association and others which had sprung up in various parts of the country. They cultivated the literary side of gardening, and encouraged the practical at the same time, and might further extend their usefulness he thought by some scheme of federation by which they circulated their papers and other sources of information among each other as was done with excellent results by similar societies in Canada and the United States of America. He urged that in the questions respecting the cultivation of the land, its distribution and tenure lay questions in which such societies might be helpful in bringing about a solution of the present depression in agriculture.

With regard to flower shows he held that as a means of popularising gardening they were excellent but thought that their power to educate gardeners was over-rated, in so far as practical matters were concerned. It was in the garden the exhibitor acquired his skill as a cultivator not in the flower show. He complained that schedules generally were unfairly balanced as regards the distribution of the money value of the prizes, vegetables being in many cases all but ignored, and in almost every case having smallest consideration given them.

There were two exhibits of merit, one a numerous collection of cut flowers of tuberous Begonias, seedlings of last year, from Mr. John Downie, Beechhill Nursery, Edinburgh; the other, a very superior yellow, was named Mrs. John Downie.

The other exhibit was from Messrs. Munro & Ferguson, Edinburgh, and was an improved form of *Matricaria inodora flore pleno* named Snowflake.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending Aug. 6, is furnished from the Meteorological Office:—

"The weather has remained in a cool changeable showery state, but the amount of cloud and rainfall has been, as a rule, considerably less than that recorded of late. Thunderstorms occurred in many parts of the country during the early part of the week.

"The temperature has again been below the mean in all districts, the deficit ranging from 4° in 'Scotland, N.'; Ireland, S., and the 'Channel Islands,' to 7° in 'England, E.' The highest temperatures were

recorded on August 2 or 3, when the thermometer over England rose to a little above 70° at the close of the week; however, the maximum readings were below 65° in many parts of the kingdom. The lowest temperatures were recorded during the early part of the week at our northern stations, and towards the close of the week at the southern stations, the thermometer falling below 40° in all districts excepting 'England, E.,' and 'England, S.' In 'Scotland, E.,' it fell to 34°, while in 'Scotland, W.,' a minimum of 33° was registered.

"The rainfall has varied greatly, not only in different parts of the United Kingdom, but in closely adjacent localities. In some of the western districts an excess is shown, owing to a somewhat heavy fall, which occurred on August 4, while in the east and south of England a similar result was brought about by the torrential rains which visited some localities on the night of the 1st. At Ingatestone the amount measured on the morning of the 2nd was as much as 3.20 inches.

"Bright sunshine has been more prevalent than it was last week; the percentage of the possible amount ranged from 25 in 'England, E.' to 40 in 'England, S.W.,' and 46 in 'Scotland, W.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## Obituary

ALEXANDER ROGER.—The horticultural community has lost a distinguished representative in the person of Mr. Roger, who died on the 7th inst. after a lingering illness. Mr. Roger was in his 63rd year. After passing some years in the service of Mr. Noble at Berry Hill, Taplow, Mr. Roger was in 1871 entrusted with the superintendence of Battersea Park. It was no slight undertaking to follow such a man as Gibson, who had founded Battersea, and made it a name of note in the horticultural world; but Roger proved equal to the task, and well maintained the reputation of the Park as a good example of popular horticulture in various styles. He retired from active service about the middle of March this year, on the occasion of the transference of the Park from the Government to the Metropolitan Board of Works. He leaves a widow and family.

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

RICH AND POOR SOIL.—It was stated lately in the *Gardeners' Chronicle* that a rich soil will retard or prevent Spinach running to seed. Seeds of *Trapa* majus are also said to produce more flowers when sown on poor soil than when on a rich one. Is it considered generally true that plants growing on a poor soil will produce more flower than plants growing on a rich one? Is not the object of manuring usually to produce a contrary effect? A. B. [A soil which is rich, especially rich in nitrogenous matter and water, undoubtedly tends to the production of foliage, while a poorer, drier soil, one containing relatively much mineral matter and little nitrogenous matter, will tend to the production of seed. But these are general statements, subject to many modifications. If the rich manure be applied at a particular time, just when the flower is commencing its development, its size and colour will be enhanced. Ed.]

## NOTICES TO CORRESPONDENTS.

CYPRIPEDIUM SELLIGERUM: E. P. We cannot tell you why the bract at the base of the flower has become unusually leafy. It is a sign of vigour rather than otherwise, and is not to be discouraged.

GRAPES DISEASED: G. B. A case of scalding generally supposed to be due to defective ventilation. There is no fungus or insect. We confess we doubt the explanation usually given, but we have no other to offer.

GRAPES SPOTTED: Ryburgh. The examples sent are typical instances of "spotting," either accidental or constitutional. Mr. Barron says:—"By some cultivators the spot is believed to be caused by sudden chills, such as having the house very close and moist, and then suddenly, on some bright morning, admitting the external cold air too precipitately and too abundantly." Spot is not contagious, as your experience indicates.

NAMES OF FRUIT: W. M. Cherry Belle d'Orleans.—H. W. Strawberry President.

NAMES OF PLANTS: K. 1, 2, 3, 4, all varieties of *Adiantum cuneatum*; 5, *Gypsophila acutifolia*.—A. C. B. Campanula Tommasiniana, and C. aparinosa.—C. W. D. Achillea micrantha, Biel.—Old Riga Subscriber. Seems to be *Cytisus ratisbonensis*, but we cannot be sure from such a scrap.—C. C. B. *Gongora galeata*, alias *Acropera Lodigiesii*.—O. P. Q. *Sarcopodium Lobbi*.—M. C. *Desfontainia spinosa*.—W. F. 1, *Lysimachia vulgaris*; 2, *Thalictrum flavum*; 3, *Hieracium aurant-*

tiaum. — J. C. L. Spirea arifolia. — G. P. 1, Euphrasia officinalis (the common Eyebright); 2, Euphrasia purpurata; 3, Trifolium arvense; 4, Teucrium scordonia. — Reader. Eleagnus angustifolia. — T. J. Calystegia (or Convolvulus) pubescens. — W. H. Wild Chicory (Cichorium intybus).

NECTARINE: E. B. The fruit of Lord Napier sent weighs  $7\frac{1}{2}$  oz., and is certainly a fine fruit.

NECTARINE CRACKING: C. B. The cracking is due to disproportionate growth of the flesh as compared with that of the skin, induced probably by excess of moisture and heat. It is no more possible to say why one tree does and another not to it does not, than it is to say why of two children exposed to an infectious disease one shall take it and the other not. Plants have their peculiarities like other living beings.

## SEEDS.

LONDON: August 8.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report:—To-day's market whilst attended, with but little business doing. An exceedingly firm feeling, nevertheless, characterises the trade generally. This applies more particularly to white Cloverseed, Alsike, and Trefoil. In which there has been a fair trade doing at enhanced rates. Alsike and Trefoil also tend upwards. More money is asked for imported Italian. The new samples of French Trifolium are not liked. Mustard and Rapeseed move off slowly on former terms. Blue Peas realise last week's prices. In bird seeds there is no change.

## FRUIT AND VEGETABLES.

SPITALFIELDS: August 8.—Buyers few and business slack, owing to holidays. Supplies of all kinds continue to be abundant. The following are the ruling quotations:—Cherries, 1s. 6d. to 5s. per half sieve; black Currants, 3s. to 3s. 3d.; red Currants 2s. to 2s. 6d. do.; white Currants, 2s. 6d. to 3s. 6d. do.; Gooseberries, 2s. to 3s. do.; Raspberries, 2s. 4d. to 1 lb. punnet; ditto, 20s. per cwt.; Strawberries, 2s. to 3s. 6d. per cwt.; English Tomatoes, 2s. 6d. to 3s. 6d. per cwt.; foreign do., 1s. 2d. to 1s. 6d. per box; foreign Green Peas, 2s. to 3s. per bushel of about 18 lb.; Peas, 2s. to 2s. 3d. per bushel of about 24 lb.; Apples, 7s. per box; foreign Plums 2s. 3d. to 3s. 6d. per flat; ditto, 2s. 6d. to 3s. 6d. per round basket; Vegetable Marrows, 1s. 6d. to 2s. 6d. per dozen; Peas, 1s. to 2s. 6d. per bushel; ditto, 2s. to 4s. 6d. per sack; Broad Beans, 1s. to 1s. 6d. per bushel; do., 2s. to 3s. per sack; Scarlet Runners, 6s. to 6s. 6d. per sieve; French do., 3s. 6d. to 4s. 6d. do.; Carrots, 1s. 9d. to 2s. per dozen bunches; Turnips, 2s. to 2s. 3d. do.; spring Onions, 1s. 3d. to 2s. do.; Mint, 1s. to 1s. 6d. do.; Parsley, 1d. to 1s. 3d. do.; Cabbages, 1s. to 3s. per tally; foreign Onions, 5s. to 7s. per cask of about 130 lb.; frame Cucumbers, 2s. to 3s. per dozen; common do., 1d. to 1s. 3d. do.; Cos Lettuces, 6d. per score of 22; Beetroots, 6d. to 6d. per dozen; Endive, 1s. to 1s. 6d. do.; English Walnuts (for pickling), 1s. 6d. per half sieve; Mangels, 1s. to 22s. per ton.

STRATFORD: August 7.—Both trade and supply have been good during the past week. Quotations:—Carrots, household, 2s. 6d. to 3s. 6d. per dozen bunches; Mangels, 10s. to 20s. per ton; Watercress, 6d. to 8d. per dozen bunches; Gooseberries, 4s. to 5s. per flat; Currants, black, 4s. to 4s. 6d. per half sieve; do., red, 3s. 6d. to 4s. do.; Green Gages, 2s. 6d. to 4s. 6d. per box; Cucumbers, 1s. 6d. to 1s. per dozen; Cherries, 2s. 6d. to 4s. 6d. per half sieve; Peas, 3s. to 5s. per bag.

## POTATOS.

BOROUGH AND SPITALFIELDS: August 7.—Supplies are adequate to demand, which is dull. Quotations.—Shaws, 60s. to 70s.; Hebrons, 70s. to 90s.; kidneys, 80s. to 90s. per ton.

SPITALFIELDS: August 8.—Quotations:—English Regents, 3s. to 4s.; do. kidneys, 3s. to 4s.; Beauty of Hebron, 2s. to 3s. 6d.; Early Rose, 2s. to 3s.; Jersey kidneys, 4s. to 5s.; do. flukes, 3s. 6d. to 4s. 6d.; St. Malo rounds, 3s. to 3s. 3d.; do. flukes, 3s. to 5s.; Liston rounds, 3s. 6d. to 4s.; Cherbourg do., 3s. to 3s. 6d.; do. flukes, 4s. 6d. to 5s. 6d. per cwt.

STRATFORD: August 7.—Quotations:—English kidneys, 80s. to 100s.; Beauty of Hebron, 60s. to 80s.; Roses, 55s. to 75s. per ton.

## PORTABLE CUCUMBER FRAMES.

R. HALLIDAY AND CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one. Prices delivered to any station in England:—  
2-light frame, 8 feet by 6 feet ... 3 10 0  
3-light frame, 12 feet by 6 feet ... 5 5 0  
6-light frame, 24 feet by 6 feet ... 10 0 0  
The glass is nailed and puttied in. Lights and framing for brick pits at proportionately low prices.

Manufactured by **THE MEADOW FOUNDRY CO. (Limited), MANSFIELD.**

See Gardeners' Chronicle, May 12.

For Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, &c. Saves more than twice its cost in labour. No Smell. No Disturbance of the Gravel.

Used in the CRYSTAL PALACE GARDENS, the ROYAL GARDENS, KEW, and other Public and Private Gardens. Mr. W. G. HEAD, Superintendent of the Crystal Palace Gardens, says:—"We were so satisfied with your Weed Killer and its price, that we have used it absolutely. I have every confidence in recommending it."

Mr. J. BELL, the Duke of Wellington's Gardener, says:—"Your Weed Killer will prove to be a great boon. It not only destroys every form of weed but leaves the gravel bright and clean."

Mr. W. EDWARDS, Gr. to the Right Hon. Earl Cadogan, says:—"I have used it (the Acme Weed Killer) on the walks, and plantains on cricket ground. It seems to answer well."

Mr. JAMES MYERS, Gr. to the Earl of Sandwich, says:—"I must say it does its work very effectually."

Mr. R. IRWIN LYNCH, Curator, Botanic Garden, Cambridge, says:—"There can be no question with regard to its efficacy."

T. HEWITT & Co., Nurserymen, Solihull and Birmingham, say:—"We find it excellent."

Price per Gallon, 2s. (tin included); 5 Gallon lots, 1s. 6d. per Gallon; 10 to 20-Gallon lots, 1s. 4d. per Gallon.

Carriage paid on 10gals. and upwards. Used in the proportion of 1 gal. to 25 gals. of water. Sole Proprietors and Manufacturers—

## Belgian.

**BULLETIN D'ARBORICULTURE,**  
de FLORICULTURE, et de CULTURE MARAI-  
CHERE. A monthly horticultural work, with superb Coloured  
Plates and Illustrations. Published since 1855, by F. BUYVE-  
RE, F. RAYNAERT, E. RODIER, and H. J. VAN HULLE,  
Professors at the Horticultural School of the Belgian Govern-  
ment at Ghent. Post-paid, 10s. per annum.

H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

## Estate Sales.

The best County medium for Advertising Sales of  
Estates is

**THE WORCESTER HERALD**, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agricul-  
turists in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to let, would do well to advertise in

**THE WORCESTER HERALD**, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.

Offices, 72, High Street, Worcester.

## GARDENING APPOINTMENTS.

MR. G. WALLER, General Foreman at Bil-  
lingbar Park, Wokingham, has been appointed  
Head Gardener to J. GODMAN, Esq., Park Hatch,  
Godalming, Surrey.

MR. C. GREEN has been appointed Head Gar-  
dener to MRS. THOMSON, Stanton House, Stanton  
St. John, near Oxford.

MR. S. THOMPSON, late Head Gardener to  
P. STANDISH, Esq., Marwell Hall, Winchester,  
has been appointed Head Gardener to Sir  
EDWARD HULSE, Bart., Breamore House, Salis-  
bury.

**WANTED, a GARDENER**, to take entire  
charge of 100 acres Market Garden Land. Must be  
thoroughly efficient in all branches and have a practical knowl-  
edge of Planting Fruit Trees, Bushes, Strawberries and  
Canes. Married, age 28 to 35. House found.—Address, stating  
wages expected and giving full particulars, **HARRISON**  
**BROS.**, Smithfield Market, Manchester.

**WANTED, a thoroughly trustworthy com-**  
petent Man as **WORKING FOREMAN** outside.  
General Nursery Stock about 20 acres. None need apply who  
cannot produce good references as to ability, honesty, and  
sobriety.—Apply, stating wages, and full particulars to **WM.**  
**THROUGHTON**, Nurseryman, Preston.

**WANTED, a young Man, as IMPROVER,**  
in Kitchen, Flower, and Large Gardens, and  
things out-of-doors connected with a large place.—**A. J. BALL**  
**HATCHET**, Head Gardener, The Gardens, Fulham Palace, S.W.

**TRAVELLER.**—A Nurseryman having a  
large stock of select Hardy Shrubs, Fruit Trees, &c., &c.  
(in the finest possible condition), is open to negotiate with a  
good **TRAVELLING SALESMAN** (on Commission only). He  
will be allowed to Sell Cheap.—Terms with proofs of ability  
and references to **C. N. H. GARDENERS' Chronicle** Office,  
41, Wellington Street, Strand, W.C. No objection to his  
engaging in other business not horticultural.

**WANTED, a thoroughly efficient CLERK,**  
in a high class country Nursery. Well up in the  
Seed and Bulb Trade, and able to prepare Nursery and Seed  
Catalogue in first-class style. Must be methodical and trust-  
worthy.—Address full particulars, age, wages expected, to  
**G. G. GARDENERS' Chronicle** Office, 44, Wellington Street,  
Strand, W.C.

**WANTED, as ASSISTANT SHOPMAN** and  
**TRAVELLER**, a pushing young Man, to work the  
Market Gardeners of Lancashire, Yorkshire, and Cheshire; a  
preference will be given to one who knows the ground.—  
Address, with full particulars, **ENGLAND'S Gardeners' Chronicle** Office,  
41, Wellington Street, Strand, W.C.

**WANTED, a young LADY FLORIST.**  
—Mrs. TAYLOR, Stephenson Place, Birmingham.

**WANTED, TWELVE LABOURERS**, for  
Laying-out work. Wages, 21s.—**WILLIAM HOLMES**,  
Frampton Park Nurseries, Hackney, E.

**TO RETIRED BUTLERS, GARDENERS,**  
and OTHERS.—A comfortable Home offered to a Man  
whose wife is a good Cook, to attend to two or three Gentle-  
men.—Apply F. E. WALKER, Esq., Yorkshire.

## WANT PLACES.

Letters addressed "Post Restante" to initials or to fictitious  
names are not forwarded, but are at once returned to the  
writers.

**NOTICE TO ADVERTISERS.**—In many instances  
Remittances in Payment of Repeat Advertisements are  
received without name, address, or anything beyond the  
postmark on envelope by which to identify the sender; this  
in all cases causes a very great deal of trouble, and fre-  
quently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their  
Names and Addresses, and also a Reference to the Adver-  
tisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and  
Others.—It is very important in Remitting by Postal Order  
that it should be paid in payable to No. 42, DRURY LANE,  
to W. RICHARDS, as, unless the number of a Postal Order is  
known, and it has been made payable at a particular office, and  
to a particular person, it is impossible to prevent any person  
from cashing it, and may fail from negotiating it.

N.B.—The best and safest means of Remitting is by POST-  
OFFICE ORDER.

**WANTED, A GARDENER!!!**—Having  
had long experience and an extensive connection we  
are in a position to RECOMMEND MEN thoroughly capable  
of filling with credit any situation in the Gardening World.  
On receipt of full particulars we will recommend a suitable  
Man. Correspondence invited.—**R. B. LAIRD AND SONS**,  
Successors to Downie & Laird, Seed Merchants, Edinburgh.

**To Noblemen and Gentlemen requiring Land Agents,**  
**STEWARDS, BAILIFFS, or GARDENERS.**

**JAMES CARTER AND CO.** have at all  
times upon their Register reliable and competent MEN,  
several of whom are personally known to Messrs. Carter &  
Sons, and are well qualified to take charge of any Estate.  
N.B.—The best and safest means of Remitting is by POST-  
OFFICE ORDER.

## SCOTCH GARDENERS.

**HANDY-MAN.**—Thorough good, on a Gentleman's Estate, or to do Repairs of an Estate of Houses. Total Abstainer. Good characters.—J. J. L., 53, Whistler Street, Drayton Park, N.

**HOLLOWAY'S PILLS.**—Nervousness and want of Energy.—When the nerves feel unstrung, and listless supplies energy, it is the right time to take some alternative as Holloway's Pills to prevent disorder running into disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They have a most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body and confidence to the mind.

**TESTIMONIAL.**

From GEORGE HIGGINS,  
 Esq., Eastlands, Dul-  
 wich, S.E.:—

"DEAR SIR,—

"The Frames arrived in perfect order. Now they are placed in position I am very pleased with them. I would never buy the old kind of light again; although yours are a little dearer at the first, they must be far cheaper in the end. No doubt before the summer is over I shall want more."

**SPAN FRAME, 12 ft. wide, for fixing on Brick Walls.**

These form excellent Cucumber or Melon Houses.

**TESTIMONIAL.**

From H. STUART MUR-  
 RAY, Esq., Efford  
 Cottage, Lymington,  
 Hants.

"DEAR SIR,—

"The House duly arrived, and was fixed with ease. Not a bolt or screw missing, and everything fitting perfectly.

"I am extremely pleased with it, and shall have pleasure in recommending you to my friends."

**RANGE of VINERIES with centre PLANT HOUSE, &c.**

**FOSTER & PEARSON, BEESTON, NOTTS.**

**IMPORTANT.**

Only the very best materials and workmanship are used in our Houses. The timber is carefully selected and dried in our own sheds 2 years before use. The so-called cheap Houses are in reality much dearer, as they are frequently decayed within 5 or 6 years of erection.

display. Visitors are cordially invited; free admission.  
Frequent trains from the City and from the West End to  
Cattord Bridge and Forest Hill Stations.  
JOHN LAING AND SONS, Stanstead Park, Forest Hill, S.E.

## OUR BEGONIAS.

12 Houses, 100 Feet Each.

Pray remember that for quality, distinctness,  
display, and immense stock, no other collection  
bears comparison. They are the finest ever seen,  
which is confirmed by the published statements  
of the greatest experts.

*Journal of Horticulture*, July 12, 1888.  
"I dropped in at Mr. Cannell's. It is impossible to ex-  
aggerate the beauty of some of the flowers which I saw. I had  
only time to run through the grand Pelargonium house, the  
Ivy-leaved Pelargoniums, and the single and double Begonias;  
but what a blaze of beauty there was! Then, when one recol-  
lects the old Ivy-leaf Pelargonium, and sees the vondrous  
trusses of double flowers and beautiful colours which are yet  
Begonias. The marvellous single and double varieties are  
bewildering in their beauty. There was also a grand new  
Heliotrope, finer than anything I had seen. Had I been able  
to remain I should doubtless have seen many wonderful things,  
but I saw enough to convince me that the Home of Flowers is  
in no danger of losing its reputation."

*The Gardening World*, July 28, 1888.  
SOMERSETSHIRE RECTOR says:—"I saw Begonias at Swan-  
ley. Their beauty well repays a visit; the shape, colour, and  
habit are excellent. If anything is wanted where everything  
is so near perfection it is a more upright flower-stalk, which a  
few more seasons will certainly produce."

*The Horticultural Times*, July 28, 1888.  
F. D. LYON, Esq., says:—"At Messrs. Cannell's establish-  
ment ALONE in all England can Begonias and Zonals be seen  
grown to perfection. With other collections of these families  
comparisons are odious."

*The Press* says:—"Cannell's Begonias were the centre of  
attraction at the Great Show at Liverpool, August 6, 1888.  
Awarded First-class Certificate."

Frequent trains from London. Entrance from  
the station. All lovers of the best Flowers and  
Vegetables are cordially invited. No horticultural  
establishment is filled with such an amount of  
interesting objects as ours at all seasons. **SEND  
FOR A CATALOGUE.**

THE  
**GREAT BEGONIA TEST OF THE YEAR:**  
"DAILY CHRONICLE," JUNE 21, 1888.  
"Begonias.—Mr. Cannell's grand First" (7 entries).  
—More important in point of honour and excellence than any  
other previous award; even that when we secured the GOLD  
MEDAL of the Royal Horticultural Society.

**H. CANNELL & SONS,**  
The Home of Flowers, Swanley, Kent.

New Edition, Corrected up to Date.

BEG TO ANNOUNCE THEY HAVE RECEIVED THEIR USUAL CONSIGNMENTS OF

THE ABOVE VALUABLE BULBS FOR EARLY FORCING,

And will be pleased to receive Orders for immediate delivery.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

For Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, &c. Saves more than twice its cost in labour. No Smell. No Disturbance of the Grass.

Used in the CRYSTAL PALACE GARDENS, the ROYAL GARDENS, KEW, and other Public and Private Gardens.

Mr. W. G. HEAD, Superintendent of the Crystal Palace Gardens, says:—"We were so satisfied with your Weed Killer and its price, that we have used it absolutely. I have every confidence in recommending it."

Mr. J. BELL, the Duke of Wellington's Gardener, says:—"Your Weed Killer will prove to be a great boon. It not only destroys every form of weed but leaves the gravel bright and clean."

Mr. W. EDWARDS, Gr. to the Right Hon. Earl Cadogan, says:—"I have used it (the Acme Weed Killer) on the walks, and plantains on cricket ground. It seems to answer well."

Mr. JAMES MYERS, Gr. to the Earl of Sandwich, says:—"I must say it does its work very effectually."

Mr. R. IRWIN LYNCH, Curator, Botanic Garden, Cambridge, says:—"There can be no question with regard to its efficacy."

T. HEWITT & Co., Nurserymen, Solihull and Birmingham, say:—"We find it excellent."

Price per Gallon, 2s. (10s. included); 5 Gallon lots, 1s. 6d. per Gallon; 10 to 20-Gallon lots, 1s. 4d. per Gallon.

Carriage paid on 10 gals. and upwards. Used in the proportion of 1 gal. to 25 gals. of water. Sole Proprietors and Manufacturers—

The AGRI-HORTICULTURAL CHEMICAL COMPANY, Tonbridge, Kent. Depot:—Bolton, Lancashire.

## EARLY ENGLISH GARDENING.

GERARD.—The year 1597 is one of the most distinct landmarks in the history of gardening, for, during its course, Gerard's great work, the *Herbal or General History of Plants*, appeared. When a theory or a practice is in its infancy, the literature thereof partakes of a tentative or even fragmentary character, and perhaps the only exception to this general rule may be cited in the case of Gerard's *Herbal*. This, however, entirely depends upon whether we regard it in the light of a botanical or of a horticultural treatise. The *Herbal* is divided into three parts or books, the first, to p. 176, treating of grasses, grain, rushes, reeds, Flags, and bulbous-rooted plants; the second, up to page 1076, of herbs used for food, medicine, or ornament, and the third dealt with trees, shrubs, fruits, rosins, gums, Roses, Heaths, Mosses, Mushrooms, and sea plants. There are, respectively, 106, 511, and 167 chapters in the three books. There are about 2000 illustrations, each of which is about 3½ inches by 2 inches, and as every one of these would now cost about half-a-guinea a-piece, it will be seen, leaving printing and paper entirely out of the question, that the undertaking can only be described by the one word, vast. The prefatory remarks are dated "from my house at Holbourne within the suburbs of London, this 1st of December, 1597." From the catalogue (1596) of the trees and plants growing in his own garden, in Holborn—and of which a *fac simile* reprint has been issued by Mr. B. D. Jackson—we may fairly assume that the father of English gardening had one of the largest physic gardens in the country. Holborn is anything but suggestive of gardens at the present time, nor, indeed, has it been for the past century. Not the remotest trace of the famous garden now exists, and nothing even to suggest the bare possibility, except the seedy shabby-gentility of Red Lion Square. "Talk of perfect happiness," exclaims the famous doctor-surgeon, "or pleasure, and what place is so fit for that, as the garden place where Adam was set, to be the

herbarist? Whither did the poets hunt for their sincere delights, but in the gardens of Alcinoüs, of Adonis, and the orchards of Hesperides? Where did they dream that heaven should be but in the pleasant garden of Elysium? As a matter of bibliographic interest, it may be pointed out that some copies of the *Herbal* have no portrait engraved by W. Rogers, which, when present, is engraved on the reverse of the last leaf of the preface. Another impression appears to have been called for in 1599; another in 1633, which was enlarged by T. Johnson; and another in 1636; but for over a century this famous work was the one botanical, herbal, and horticultural authority. We should very much like to make something more than a mere incidental reference to Gerard's descriptions of the Goose Tree, or Barnack Tree, the Stonie Wood, or woode-made stones, sponges, and corals, but space does not permit. We may say, however, in leaving a most interesting subject, that the *Herbal* has no fewer than four indices, and that Gerard himself died in 1607.

In pointing out the broad characteristics of the adaptability to our English climate and scenery of the Elizabethan style of architecture, a writer in *Fraser's Magazine* of over a quarter of a century ago expressed surprise that, while so much attention has been paid to the study of this style for country residences, but comparatively little has been done for promoting a knowledge of the style of gardening which prevailed at the same period. The principles which regulated Elizabethan gardening may be thus summarised:—1. To lay out the garden in accordance with the domestic architecture of the period; there were the long terraces and right lines to harmonise with the rectangular lines of the building and the long galleries of the interior. 2. To plant the beds with mixed flowers, and to let the colours so intermingle and blend together that the whole should produce a mosaic of rich indeterminate colour, ever new, and ever-varying, as the flowers of different seasons succeeded each other. The Elizabethan garden was never without arbours, and these were either formed by, or covered with, sweet-scented shrubs, such as Honeysuckles, Woodbines, Musk Rose, or Eglantine. The last-named was an especial favourite, and it is frequently alluded to by the old poets and dramatists. Sarnfield, for example, in *The Affectionate Shepherd*, sings thus:—

"I would make cabinets for thee, my love,  
Sweet-smelling arbours made of Eglantine.

Our forefathers had quite an inordinate passion for sweet-swelling plants and flowers.

That monstrous bogey—whose death has been so protracted and so hard—the Dutch style of topiary work, to wit—preceded the accession of William III. by over a century, for in the reign of Elizabeth we have such extraneous horticultural attributes as figures of temples, vases, statues, formal canals, broad, straight walks, bordered by walls of closely-cropped foliage. In the time of Henry VIII. the gardens of Nonsuch House were laid out in the Italian style, with the inseparable pyramids, statues, fountains, and so forth.

Leland (who died in 1552) in his *Itinerary*, which was first printed by Thomas Hearne in 1710, describes the gardens at Wrexhill Castle, Yorks, as containing "mountes, opera topiaria, written aboute with degrees like cockill-shells to come to the top without payn." Similar examples may be drawn from various sources, which are essentially authentic. William Rogers, who both drew and engraved the exceedingly quaint title-page to the first edition of Gerard's *Herbal*,

delineates this very precise and rule-of-thumb style. We have, in this unintentionally valuable picture, the beds in perfectly symmetrical order, and the trees very proper in outline. Mr. Rogers undoubtedly brought what was to him everyday fact into requisition, but he has also drawn considerably upon his imagination for the more fanciful and classic phases of his picture, particularly in the case of the two little Cupids, presumably in *nubibus*, who are busy watering with water-pots the fruit trees from overhead! Probably the picture of the house, as a whole, was taken from real life.

There is, however, an absence of statue work in the garden. The straight walks and geometric beds were edged with Box, Thrift, and Thyme, and were "like the patterns of Arabic tracery, stiff and formal." Giles Fletcher gives us a description of one of these formal gardens "cut like a lady fair."

"The garden like a lady fair was cut  
That day as if she slumbered in delight,  
And to the open skies her eyes did shut."

Upon a hilly bank her head she cast,

On which the border of vain-delight was built;  
White and red Roses for her face were placed,  
And for her tresses Marigolds were spilt."

Spenser, in his *Faery Queene* (bk. 2, canto xii., lviij.) shows the other as a charming side of the picture of the English or natural style of garden which was then struggling for recognition at the hands of the Elizabethan designers:—

"There the most daintie Paradise on ground  
It selfe doth offer to his sober eye,  
In which all pleasures plenteously abound,  
And none does others happinesse enuye;  
The painted flowres, the trees upshooting hye,  
The dales for shade, the hilles for breathing space,  
The trembling groves, the chistall running by,  
And that, which all faire workes doth most agrace,  
The art which all that wrought appeared in no place."

Various circumstances contributed to the fostering of the innate love for flowers, and to give an impetus to gardening; but more particularly the greatly extended intercourse with fresh countries, the internal peace, and the efforts of James Cole, John Tradescant and Nicholas Lete, to procure plants from the new countries. Many of the rare and curious plants, which were such favourites in the time of Elizabeth, are quite unknown in our gardens of to-day. But, perhaps, we can reconcile ourselves to this loss when we remember that the Potato and Tobacco have not only survived, but in a wonderfully developed form. W. R.

## NEW OR NOTEWORTHY PLANTS.

### ALOE (EUALOE) PENDULIFLORA.

Baker, n. sp.\*

This new Aloe, which has just flowered at Kew for the first time, was sent by Sir John Kirk from Zanzibar in 1884. It is allied to *A. consobrina*, spicata, and *Hildebrandtii*, the latter a fine new species, lately figured in the *Botanical Magazine*.

Stem simple, erect,  $\frac{1}{2}$  inch diameter; leaves laxly disposed, spreading, ensiform, about 1 foot long, 1 to  $\frac{1}{4}$  inch diameter, plain green, nearly flat on the face, rounded on the back, the marginal prickles small, deltoid, cuspidate. Raceme dense, simple, erect, with a pendulous peduncle half a foot long, produced from the axil of one of the upper leaves; pedicel  $\frac{1}{2}$  inch long; bracts lanceolate, much shorter

\* *Aloe (Eualoe) penduliflora*, n. sp.—Caulis erecto simpliciter gracili; foliis laxè dispositis patulis ensiformibus viridibus immixtulis subpedunculatis, dentibus marginalibus deltoidibus; pedunculo deltoideo axillari semipedali; racemo dense simpliciter erecto, pedicellis elongatis apice articulatis; bracteis lanceolatis; perianthio luteo apice viridulo, tubo cylindrico elongato segmentis brevibus lingualis; staminibus breviter exsertis.

than the pedicels. Perianth pale yellow, tipped with green, above an inch long; segments lingulate, less than half as long as the tube. Stamens just exserted; anthers small, oblong, red. *J. G. Baker.*

### ONCIDIUM PUMILUM, Lindl.

It is highly interesting to see to what a degree of development an Orchid, usually insignificant, may attain under excellent management. *Oncidium pumilum* is usually a poor, starved thing, at whose sight a modern English amateur shrinks. The longest inflorescence I know of is represented in Vellozo's *Flora Fluminensis*. Sir Trevor Lawrence, Bart., M.P., P.R.H.S., has kindly sent me a leaf of unusual strength, more than 5 inches long, by  $\frac{1}{2}$  wide, marked with the usual blackish-purple spots. The inflorescence is much longer than a span, and the branches are longer than I ever should have thought possible—between 3 and 4 inches. With this development the usually humble plant assumes attractive features. *H. G. Rehb. f.*

### CATTLEYA INTERMEDIA PARTHENA, n. var.

A gleaming beauty, a snow-white flowered variety, kindly sent me by Mr. R. H. Measures, The Woodlands, Streatham, S.W. It came with *Laelia elegans* var. *Tautziana*, as imported by Mr. F. Sander. The bulbs are said to be double the length of those of *Cattleya intermedia*. As to this point I may state that I have several times seen *Cattleya intermedia* with bulbs quite equal to those of *Laelia elegans*. *H. G. Rehb. f.*

### CATTLEYA LABIATA GASKELLIANA ALBA, n. sub-var.

This is a grand variety, quite white, excepting the yellow throat. It was flowered at the same time by Mr. R. H. Measures, of The Woodlands, Streatham, London, S.W., and by Mr. F. van Imhoof, Mont St. Amand, Gand. The latter gentleman (as also Mr. Measures), has watched the flowers, and ascertained that they do not turn rose-coloured. Hence there is no question of the Berlin *Cattleya Gaskelliana albens*, that reappeared recently with Messrs. H. Low & Co. *H. G. Rehb. f.*

### MASDEVALLIA PLATYRACHIS, Rolfe, n. sp.

This is a new and very remarkable species of *Masdevallia*, and one which presents such a series of anomalous characters that it appears to constitute a totally new section of the genus. In the first place, the scape is flattened and sword-like; hence the specific name proposed. Then the tube of the sepals is so extremely short as to be almost obsolete, while the free portions of the sepals are not prolonged into tails, as in the majority of the species. The very short tube is seen in the group containing *M. swartzii*, *gibberosa*, *ochthodes*, and some five others, but in this group the lip is uppermost, not underneath, as in the present species (and, indeed, in all except the little group above-named), while there are other characters which do not agree. The plant was imported from Costa Rica by Mr. Shuttleworth, and sent to Kew in 1884, in which year a scape was produced. It has now become fully established and is bearing several scapes, the first flower having recently expanded. The following description will explain its character:—

Plant densely tufted. Leaves oblanceolate-oblong, minutely tridentate, the midrib sharply keeled behind at the apex, attenuate below into the short petiole, light green, 2–6 inches long, 8–12 lines broad. Scape flattened, 6–9 inches long,  $\frac{1}{4}$  line broad, bearing about four empty bracts below the flowering portion, each about equidistant from each other, and about six flowers in succession, about three-quarters of an inch long. Bracts 3 lines long, the lower half sheathing, the upper half free, but the sides oppressed together; thus laterally flattened, triangular-lanceolate, subobtus. Pedicels 5 lines long. Ovary  $\frac{1}{4}$  line, sharply triangular, the angles almost winged. Tube of sepals barely one-third line long, the free portions lanceolate, acute, 3-nerved, the central nerve keeled, margin reflexed; upper two-thirds distinctly verrucose inside, three-

quarters of an inch long, light buff, paler towards base of dorsal sepal, becoming orange on the same portion of the lateral ones, nerves green. Lateral sepals connate for 2½ lines, somewhat falcate, almost parallel, a little narrower than dorsal one. Petals narrowly linear, obtuse, slightly falcate, 2½ lines long, chestnut-brown, the central nerve darker than the rest. Lip 1½ line broad at base, gradually narrowing from apex of side lobes to an acute point; flat behind, sharply recurved from the apex of the side lobes, at which point a pair of acute keels leave the margin, and run parallel with it to near apex, the keels themselves gradually approaching each other; light yellowish-brown, inclining towards reddish, the central nerve, and the lateral pair which run into the keels, being of a slightly darker shade. Column green, with a pair of broad rounded wings, which are buff on the margin. Pollen masses two, precisely as in the genus. The lip of this remarkable plant is attached by a delicate hinge and oscillates up and down with the slightest movement. The flowers open about three-quarters of an inch from apex of dorsal sepal to that of the lateral ones. The singular aspect of the plant will be at once apparent from the above details, there being no single species with which it can be compared, either in structure or colour. I am not aware if any other plants are in existence in the country. R. A. Rolfe.

## LILACS.

The following notes from the pen of Professor Sargent are extracted from *Garden and Forest* :—

*Syringa vulgaris* is a native of the mountainous region of Central Europe from Piedmont to Hungary. It has been a favourite garden plant for three centuries, and has produced in cultivation a great number of varieties with more or less dense inflorescence, and with flowers varying from purplish-red to pure white. Double-flowered and blotched-leaved varieties are cultivated. The leaves of this species and of all the varieties are often greatly disfigured in the United States during the summer and autumn months by the attack of a white mildew.

*Syringa oblata* is not known in a wild state; it was first discovered by Fortune in a garden at Shanghai, and, later, by the Abbé David, in gardens near Peking. Its perfect hardiness in this climate indicates its northern origin. *S. oblata* differs but slightly in botanical characters from some forms of *S. vulgaris*, a geographical variety of which it should, perhaps, be considered, although, from a garden point of view, quite distinct. Here it flowers ten or twelve days earlier than the earliest varieties of *S. vulgaris*, and its thick, leathery leaves, which are never attacked by mildew, turn in the autumn to a rich dark russet-red colour—a character which should be taken advantage of by hybridisers to secure a new race of Lilacs with the large inflorescence of *S. vulgaris* and the foliage of this Chinese plant. *S. oblata* is a stout spreading shrub here, now 8 or 10 feet high, flowering profusely every year. There is a white-flowered variety which has not flowered here.

*Syringa chinensis*.—This plant, although long cultivated, is not known in a wild state. It is believed to be of Chinese origin, and it is not uncommon in the gardens of Peking. In general appearance, in the shape of the leaves, the size of the flowers, and in the period of blooming, it is intermediate between *S. vulgaris* and *S. persica*. This is one of the hardiest and handsomest shrubs in cultivation, producing its enormous rather lax clusters of flowers in the greatest profusion. There are varieties with rosy-purple and with white flowers.

*Syringa persica* has long been an inhabitant of the gardens of Persia and India, whence it was introduced into Europe and America. Its native country, however, was long unknown until it was met with by Dr. Aitchison, of the Afghan Boundary Survey, who found it "a very common shrub on the low and outer hills near Shalialun up to nearly 7500 feet." Varieties with lilac and with white flowers are

common. *S. pteridifolia* is a variety in which the leaves are deeply lacinate.

*Syringa villosa* was discovered near Peking about the middle of the last century by the French missionary, d'Incarville. It was found in the same region by David, and plants raised from seed sent to the Arnold Arboretum from Peking by Dr. Bretschneider are now growing there. To this species should perhaps be referred, as M. Franchet hints in his paper upon the Chinese Lilacs,\* *S. Josikaea* and *S. Emodi*, which, as he points out, cannot be separated from d'Incarville's plant either by the shape of the leaves, the character of the inflorescence, or by the shape or size of the flowers. In the Himalaya plant (*S. Emodi*), however, the long white hairs which cover the under side of the leaves of *S. villosa* are replaced by a minute pubescence on the midrib, which is even less developed on the leaves of *S. Josikaea*. The bark, colour and markings of the young shoots, and the habit of these three plants are identical, although in *S. Josikaea* the leaves are narrower than in the Chinese plant, but not narrower than those of many Himalayan specimens. The plants of *S. Josikaea*, now widely distributed in gardens, have all been propagated from a single plant discovered in a Hungarian garden, but not known to be wild in Europe, and probably of Asiatic origin.

*Syringa pекinensis* is a native of the mountains of Northern China, where it was discovered by David. It is growing in the Arnold Arboretum, where it was raised from seed sent by Dr. Bretschneider from Peking, but as yet has shown no disposition to flower. It is a slender tree-like shrub, perfectly hardy, and already 10 to 12 feet high, with long, graceful, flexuous branches, covered with smooth yellow-brown bark, not very unlike that of a Cherry tree. A plant with distinctly weeping branches appeared among the seedlings raised in the arboretum.

## ORCHID NOTES AND GLEANINGS.

### DENDROBIUM SPHEGIDOGLOSSUM, Rehb. f.

This scarce species has recently been sent to the Kew Herbarium by Major-General E. S. Berkeley, who obtained it from the hills on the frontier of Siam; it was also collected by Parish in Burmah. The stems grow to about 9 inches in height, they are spindle-shaped, and not very thick. The leaves are narrow, oblong obtuse, and marked on the upper surface with numerous impressed dots. The flowers are of rather small size, about ½ inch long, and are produced from the old stems in short 2–3 flowered racemes, with oblong obtuse, complicate, yellowish-green bracts. The upper sepal is lanceolate acute, the lateral sepals elongate, triangular, acute, keeled down the back; the petals are lanceolate obtuse, and the rather narrow lip is three-lobed with narrow triangular side-lobes, and an oblong middle lobe, all three lobes being fringed with curled hairs. The colour of the flower is yellowish-white, with some very delicate red veins on the sides of the lip and the tip of the lip marked with orange-red. N. E. Brown.

### ORCHIDS AT MESSRS. SEEGER & TROPP'S.

In their new establishment at Lordship Lane many fine and curious Orchids are now got together, as well as good importations of the showy species, and notably a grand lot of *Laelia purpurata*, which curiously enough are now sending up their spikes. Many superb masses are among them, the largest, which has over 200 pseudobulbs and twenty flower-sheaths, being probably the largest single mass ever got over.

The Cypripedium collection which has just produced the singular *C. Stonei* acrosepalum has now another new hybrid in bloom, the result of a cross between *C. Spicerianum* and *C. Harrisianum*. Its flowers are very handsome, and much like the beautiful *C. Tautianum*, it having the same rosy flush

over them; the form of the dorsal sepal, however, is that of *C. Leeannum*. The leaves are handsome, like a strong *C. Spicerianum*, with a slightly darker veining—certainly an acceptable variety.

On the tank beneath the rockery in the intermediate-house are growing in great luxuriance some rare *Sobralias*, which seem to like the situation. A grand specimen of the noble *S. Cattleyae* has stems 8 feet in height with very stout and vigorous young growths which will doubtless flower when mature. A good lot of *Vandas* have some in bloom, also a fair sprinkling of flowers on *Cattleya Gaskelliana*, *C. velutina*, *C. bicolor* Wrigleyana, *Angraecum Scottianum*, *Saccolabium gemmatum*, many *Cypripediums*, *Masdevallias*, and *Oncidium*s, and a grand strain of *Oncidium Papilio majus* of great size, fine colour, and handsome marking. Some of the flowers measure 7 inches from the top of the upper sepal to the front of the labellum.

### SOBRALIA LEUCOXANTHA.

Were it not for the short time—in most cases a single day—during which the flowers of *Sobralias* last, the genus would occupy a place in the very first rank of beautiful Orchids. As it is, they are not grown by any means so extensively as they deserve to be, for what the flowers lack in duration they make up in numbers. The old *S. macrantha* is rarely without bloom when the flowering season has once commenced, and few plants grow with greater freedom, if treated liberally. We find that during active growth occasional waterings with a weak solution of cow manure are very beneficial.

*S. leucoxantha*, a new and at present rare species, proves to be a most beautiful addition to the genus. The flowers are 3 to 4 inches in diameter, with sepals and petals of pure white, the latter differing only in being somewhat shorter and broader. The outer side of the lip is white, as is also the frilled edge on the inner side, but the colour gradually deepens into a beautiful golden-yellow in the throat. This species is not so strong a grower as some others, the slender stems measuring from a foot to 18 inches in height. It should be grown in the East Indian-house in a pot of fibrous peat. Like its congeners it requires copious supplies of water when growing, and at no time should be allowed to become dry. A plant is flowering at intervals in the Kew collection, from which a figure has been prepared for the *Botanical Magazine*, W. B.

## CULTURAL MEMORANDA.

### BROWALLIA ELATA.

If a pinch of seed of this pretty blue-flowered, half-hardy annual be sown forthwith in shallow pans filled to the rim with light sandy mould, and covered lightly with the same compost, placed in heat and watered with a fine rose, young plants will soon appear. These should be kept near the glass to prevent them making a weakly growth, and as soon as large enough they should be pricked out into shallow boxes, about 2 inches apart, in a compost consisting of three parts light sandy loam and one of sweet leaf-mould, watered, and returned to heat as before. Subsequently pot them into 3-inch and 4½-inch pots. These plants are very useful for conservatory and greenhouse decoration during the winter and spring months. H. W. W.

### AQUILEGIAS—VEITCH'S NEW HYBRIDS.

There has been a great improvement effected in the Columbine within the last few years by Messrs. James Veitch & Sons. Their new hybrids comprise many new combinations of colours in the same flower, the colours ranging through all shades of lavender, blue, mauve, white, yellow, orange, scarlet, and bright rose-pink. The *Aquilegia* is a very useful and effective hardy perennial, treated either as a border plant or potted up for the embellishment of greenhouse and conservatory during the spring months. A good stock may be easily worked up

\* "Observations sur les *Syringas* du Nord de la Chine," *Revue Soc. Philomatique de Paris*, July, 1885.

either by divisions of the roots being transplanted to where they are intended to flower, or potted up into 4½-inch and 6-inch pots, in rich soil, or by seed in shallow pans, in March or August. By adopting the latter method of procedure new shades of colour may be obtained. The pans containing the seed should be put into a close frame, and watered through a fine rose. As soon as the seedling plants appear give sufficient air to secure a sturdy growth, and as soon as large enough prick out, at 2 inches apart, in shallow boxes filled with a mixture of light sandy loam and leaf-mould in the proportion of three parts of the former to one of the latter; return to the frame, giving them a position near to the glass, and shade from sunshine until the roots have taken to the soil, subsequently pitting the plants singly into 3-inch and 4½-inch pots; then stand the pots on coal-ashes in shallow frames or pits, water, and keep close for a few days until they have pushed into the soil, after which a free circulation of fresh air should be admitted. As the plants show signs of going to rest water should be given less frequently at the roots: keeping them on the dry side during the winter months. Towards the end of February remove the loose surface soil, and top-dress with the mixture indicated above prior to placing the plants in gentle heat—say a vinery or Peach-house just started—when they will soon start into growth. *H. W. W.*

#### THE MINULUS.

The richly marked flowers of this hardy perennial, together with its easy culture, renders it a very desirable and effective border and pot plant for conservatory and greenhouse decoration during the spring months. The plant is easily propagated by transplanting or potting up divisions of the roots in moderately rich soil, and from seed sown in March or August; afterwards treating the seedling plants in the manner recommended above for Aquilegias, tying out the plants subjected to pot culture as soon as the flower-spikes appear. *H. W. W.*

#### EPILORIUM ANGUSTIFOLIUM.

This, just now, is very gay and effective in gardens, and is a very telling and desirable plant for certain situations; the places, perhaps, for which it is best adapted being half-cultivated spots, such as woodland walks or shrubby borders, where it raises its tall spikes of flowers and looks quite at home. This Willow-herb comes readily from seed, sown as soon as ripe, or in the spring, and it may also be increased readily by division, and when once planted it spreads and takes care of itself.

#### PYRETHRUMS.

For flowering in the herbaceous border during spring and early summer, and for cutting purposes, Pyrethrums are very valuable, and especially the single forms. These may be raised readily from seed, and much variety obtained; but to have really showy, good sorts, the better way is to get a few distinct named ones. Seed may be sown at once. Prepare some soil by sifting, spread it on the ground, make firm and water, after which the seed may be scattered thinly over the surface, and slightly covered, and then place over it a handlight to assist it to germinate. As soon as this takes place air must be given, increasing the quantity as the plants gain size, till they are fully exposed to the weather. The pricking out is best done during a dull showery day, when the plants should be dibbled in rows, and there left till they bloom, when those worth saving can be selected and marked, or the inferior ones pulled up and destroyed. If plants are to be purchased, it is advisable to have them in pots at this season, as then they suffer no check, and take to the ground at once, but to enable them to do this they must be kept well watered till the roots get a start. Pyrethrums, both double and single, do well in almost any kind of soil, but in the spring they quickly suffer from drought, and it is only those that have plenty of moisture that carry fine blooms. Liquid manure is a great help to them when they are flowering, a period at which they will take any quantity. The double kinds of Pyrethrum admit of

ready propagation in spring, when they may be divided by simply cutting them through, or by lifting the plants and pulling them apart, as any that have stood a year or two have numerous crowns, and each piece with roots will grow. Division may also be carried out in the autumn. *J. S.*

### CYRTOPODIUM SAINT-LEGERIANUM.

This may be regarded as the showiest form of the variable *C. punctatum*, from which it does not seem to differ in botanical features; it is, however, far handsomer than the general run of the species, and the bracts, which are highly developed, are barred and blotched with chestnut-red of the same bright hue as that seen on the yellow flower-segments. A glance at the *Botanical Magazine* figure of *C. punctatum*, t. 3507, which represents one of the lightest coloured forms with greenish-yellow bracts without spotting, shows how wide the range is between the variety there depicted and the one we here illustrate (fig. 20); but those who know the plant will have seen many forms intermediate between the two. *C. Saintlegerianum* was discovered in Central Paraguay by M. de St. Leger, the finder of the pretty *Oncidium Jonesianum*, and was exhibited by Mr. Cumming, gardener to A. H. Smee, Esq., of Hackbridge, at the Royal Horticultural Society, March 9, 1886, when it received a First-class Certificate. On March 13 of this year it was again shown, on which occasion our illustration was taken.

### FLORISTS' FLOWERS.

#### THE FLORISTS' TULIP.

TULIP growers have had to wait and watch for a suitable dry time in which to take up their bulbs; and all are, no doubt, out of the soil by this time, and enjoying that dry rest above the ground which is always considered by Tulip growers to be better for it than a wet one below; and we are informed by men of experience that the bulb which has been kept cool and dry strikes root with far greater force at its natural time for rooting, which is about the month of September.

It must not be supposed that when the Tulip bulb is lifted and dry that, though life is dormant, it is actually stagnant. As the Rev. F. D. Horner has stated, in one of his pleasant papers on this gorgeous flower, "There is no suspended animation in the Tulip bulb. It is full of ripe and ready active juices, and these are stirred by such nerve and pulse as may be in vegetable life, and are used at once, though invisibly, in building up tissue and structure of next year's foliage, stem, blossom, and seed-pod, together with, not least among the hidden wonders, the germ of the bulb to follow. Cut through the bulb when newly ripe in June and you will see nothing but so many fleshy, juicy layers, united on a base, or radical plate; but watch the bulb from time to time, as autumn draws on, and you will see that its very shape has been gradually altering. Instead of losing flesh, it seems to have gained it, and its tissues are fuller of sap than ever. They are tense, and bright, and fervent; while at the vital base of the bulb—its most vulnerable part—the coronal of fibres, with the point of every future rootlet almost pricking through, is very prominent. Probably the pale tip of the young shoot, the 'guard-leaf' as it afterwards becomes, is already visible; but, if not, dissection would reveal every leaf of the future foliage—every petal of the coming flower, with every chance notch and imperfection of shape pre-figured in it—every stamen, and the seed-pod with its triple stigma, only at this early stage the proportions of the various parts are not in their final order; for the embryo stamens are larger than the petals of the unborn flower, and there is little or no visible stem. Close by, and upon the radical plate, like the rest, will be seen a far tinier shoot, or eye, and this is the crescent bulb for a year beyond the present. Contemporary

offsets are similar germs, attached also to the radical plate, and lying between folds of the parent bulb. If they are large they may be seen attached in the same way to the outer layer of the bulb."

This passage, while it teaches some interesting physiological facts connected with the Tulip, also shows how necessary it is that the utmost care should be observed in preserving the bulbs from the time of lifting until that of planting.

The Tulip appears to prefer a rather heavy in preference to a light soil. I think one reason why Mr. Barlow's Tulips were below their usual mark this season was the lightness of the soil in which they were grown. While the incidence of the season had something to do with the unequal growth—and this was observed all round among the growers—the spongy character of the soil had something to do with it. Mr. Barlow finds great difficulty in getting suitable soil in his district; it is more or less impregnated with metallic oxides, and these the Tulip does not like. Old Tulip growers hold the opinion that a soil that will grow good Wheat and Beans will grow good Tulips also. A rather stiff and deep loam suits it best; and should it be too clayey, a balance can be struck by mixing with it some chopped-up sods of decayed turf and coarse river-sand.

Mr. Horner has stated that he never had Tulips better than when once, by change of residence, he had to plant them after Potatoes, in a clayey soil that was well-drained and worked. If the soil is good, there is no need to dig manure into it at the time of planting; it is enough to give a surface mulching of short manure after planting is done. The Tulip likes a little salt in the soil. Mr. Horner further states:—"I use the same ground every year for Tulips, and nearly every summer, just after taking them up, give the beds a fair sprinkling of common salt, till they seem as if whitened by a slight fall of snow, not quite enough to cover the ground."

Some years ago a discussion took place in one of the floricultural publications of that day on the subject, "What is it kills Tulips?" The conclusion reached—and it is, no doubt, the correct one—was, it is wet, rather than frost, which kills Tulips. It is the necessity for drainage that illustrates the practice of raising the Tulip bed above the level of the surrounding ground. Wet is the most deadly foe of the Tulip, and the moister the position of the bed, the higher should it be raised; in such a case 18 inches would be none too much. If there is a good deep soil drought may not be feared, as the fibres strike down very deeply into it. If a very dry time sets in, and the plants show signs of suffering from it, a good surface watering can be given with advantage.

November 9 is the traditional time for planting Tulips. In the days when such a fine collection was grown at the Royal Nursery, Slough, planting was always done within a day or two of Lord Mayor's Day. The later the district, the earlier should planting be done. Something depends upon the weather, for planting is best performed when the soil is friable and fairly dry. This operation might be performed during the last two weeks in October.

What sorts of Tulips can be obtained by those who are desirous of entering upon their culture? No one in this country publishes a catalogue of late florists' Tulips; but the following are grown by the Northern florists, and they can, no doubt, be had:—Feathered bizzars: Garibaldi, rich golden-yellow ground, best in its feathered form; George Hayward, finely feathered with dark crimson-maroon—a variety that generally comes in good form; Storer's William Lea, rich deep golden ground, and fine bronzy-maroon feather; Hepworth's General Grant, a rich scarlet-feathered bizarre of the colour of Orion and Dr. Hardy; Masterpiece, good pure golden ground colour, finely feathered; William Wilson, said to have originated from Masterpiece, also very fine; Ashmole's Lord Raglan, very finely pencilled, and golden ground colour; and Sir Joseph Paxton, always good. Flamed bizzars: Sir J. Paxton, Dr. Hardy, Orion, all to be depended upon; Excelsior, a fine dark flower, one of the late Dr.

Hardy's seedlings; and Storer's No. 4, a fine flower. Feathered roses: Modesty, a charming variety, with a rich deep scarlet feather on a white ground; Martin's 101, beautifully feathered, but wanting in shape; Nancy Gibson, rich in colour, quite

William Bentley, a scarce variety, finely feathered; and Alice Gray, also a good useful flower. Flamed byblœmens: Talisman, one of the very best in cultivation; Duchess of Sutherland; Adonis, very fine; and Friar Tuck, a rosy byblœmen, fine and correct

posely omitted a few of the newer varieties, because they are practically unobtainable at present. *R. D.*

#### THE DAHLIA.

The plants require constant attention in pinching

FIG. 20.—*CYRTOPODIUM SAINTLEGERIANUM*: PORTION OF THE INFLORESCENCE: FLOWERS YELLOW, HEAVILY BARBED AND SPOTTED WITH BROWN. (SEE P. 180.)

a scarlet; and Industry. Flamed roses: Annie McGregor, perfect in marking and shape, very fine; Aglaia, a good old variety, especially when in its best form; Lady Sefton, bright in colour; and Mabel, very pretty and striking. Feathered byblœmens: Bessie, Mrs. Jackson, with a rich feathering of glossy raven-black; Mrs. Cooper,

when in its best form. Breeder Tulips—bizarres: Excelsior, Sir J. Paxton, William Lea, Horatio, Abe Lincoln, Ashmole's Seedling, and Storer's No. 4. Rose breeders: Mrs. Barlow, Annie McGregor, Lady C. Grosvenor, Miss Burdett Coutts, and Industry. Byblœmen breeders: Glory of Stakehill, Adonis, Talisman, and Elizabeth Gill. I have pur-

or cutting out all superfluous growths, and I would remark here that pinching is better than cutting out. When a plant has been allowed to grow until it has formed a thicket of shoots, that have hardened, and must be removed with a knife, it cannot be expected to do so well afterwards as if the growths had been small and soft, easily removed by

pinching them out with the finger and thumb. These soft growths, when taken off below a joint, strike readily in a frame, and when rooted may be planted in large 60 or small 48-pots. Each plant will form a tuberous root, and in October they may be dried off without removing the plants from the pots, and if they are stored where frost is excluded they can generally be kept in good condition through the winter. The pot-roots, as they are called, come in useful when the ground-roots are ripened badly, and rot off even when carefully kept. I put aside six good roots of one particular variety last year, and every one decayed in the winter, and so I lost the stock, not having any pot-roots of it. The plants have suffered from too much water this year, and are not by any means so strong as if it had been a hot and dry season.

#### HOLLYHOCKS.

We have tried these handsome garden plants by letting them remain in the open garden all through the winter. On a dry border, and sheltered from the north wind, not a single plant has died; but in a part of the garden where the water does not drain away so freely, and where the plants are exposed to the north, every plant has died. It is therefore not safe to leave choice varieties out-of-doors, unless they are placed in a sheltered and a moderately dry position. It is, perhaps, rather troublesome to keep such plants in pots through the winter; but those who object to this may plant them out close together in frames in light dry sandy soil. They can be protected by the glass lights from the winter weather. The disadvantage attending the plants in frames is the fact that they do not produce their growths early enough to form cuttings which will give strong flowering plants the same season; whereas those placed near the roof-glass in a heated house may have shoots strong enough to take off for cuttings in January. Cuttings may be taken now wherever they can be obtained, and all the side growths on which there are dormant eyes may be taken off, and the eyes can be planted in small pots, using light sandy soil. They soon form roots in cold frames if the lights are kept close over them. *J. Douglas.*

#### VIOLAS.

From Messrs. Dobbie & Co., of Rothsay, we have received a number of flowers of *Violas*, which for correctness of form, variety, and purity of colour, are of a high order of merit. Crown Jewel may be mentioned as very lovely, the rounded petals being all of a rich maroon or purple-velvet colour, edged with a wary margin of white; while the lowermost petal has an orange blotch, forming an excellent indicator for vagrant insects, the button-like head of the style lying exactly on the blotch. The strain may be highly commended.

### IRISES.

*IRIS CYPRIANA*, *J. G. Baker and M. Foster, n. sp.*—A tall large-flowered Iris of the *Pogoniris* group, with a massive compressed branching many-flowered scape, 3 feet or more in height. The spathe-valves are conspicuously navicular while the flower is in bud, and become more or less scarious during flowering.

The blade of the obovate cuneate falls, which is 12 cm. long by 6½ broad, is a fine somewhat reddish-lilac, with thin inconspicuous darker veins; the claw is marked by thick greenish-brown branching veins on a creamy-white ground. These veins spread over the base of the blade and end abruptly at a transverse line drawn through the end of the beard, which is massive, reaching far beyond the

styles, the stout hairs being white, tipped with orange, especially at the back. The under surface of the claw is marked with purple spots.

The blade of the oblong-unguiculate standard, 9 cm. long by 6 cm. broad, is of a lighter more blueish lilac. The long claw, 2 to 3 cm. in length, is marked with reddish-brown spots arranged in broken lines.

The styles are of a lilac or lavender colour, lighter still than the standards, except along the median line. The crests are broadly triangular, divergent, with serrated edges.

The relatively long tube is light green with faint purple streaks in continuation of the claws of the standards.

This *Iris*, by its inflorescence, belongs to the *I. pallida* group, though the peduncles are relatively longer, and has a certain superficial resemblance to *I. pallida* itself, but appears to me to differ from it, to the value of a species, in the following points:—

1. In *I. cypriana* the spathe valves and peduncular bracts are conspicuously navicular, and at flowering time are scarious in part only, sometimes only half scarious, the extent varying according to dryness of season, and are brown scarious.

In *I. pallida* the spathe valves are never navicular, and are wholly scarious—paper-white scarious—long before flowering, while the buds are still immature, and that whatever the weather. This is a very marked feature of *I. pallida*, and makes itself felt in the hybrid offspring of *I. pallida*. In *I. plicata*, or *I. Sweetii*, which are hybrids of *I. pallida*, the spathe valves are as scarious—and as early scarious—as in *I. pallida* itself. I am consequently led to lay great stress on this character.

2. The form of the perianth segment is different in the two. In *I. cypriana* the fall is obovate-cuneate, in *I. pallida* it is more or less broadly ovate, in some cases very broad and short, in other cases rather longer in proportion to breadth, but never so relatively elongate as in *I. cypriana*. The standard similarly in *I. cypriana* is oblong-unguiculate, with a long claw; in *I. pallida* orbicular-obovate, with a short claw.

3. In *I. pallida* the tube is very short, the ovary is short and broad, very distinctly hexagonal with six distinct grooves, becoming as a ripe capsule, a short, broad ellipsoid.

In *I. cypriana* both tube and ovary are relatively longer, and the ovary though really hexagonal with six grooves, has three sides broader than the others, so that it appears somewhat trigonal, and ripens into a capsule which is an elongate ellipsoid.

It is true that the ovary in the different varieties of *I. pallida* varies a good deal in length relative to breadth; some are very short and broad, others are relatively long, but in each case the end is rounded obtusely and abruptly. In *I. cypriana* the ends thin away more gradually from the middle. I do not know what exact term to use—it is not unlike a torpedo with blunt ends.

4. The styles in *I. cypriana* are, relative to breadth, longer than in *I. pallida*, which are notably short and broad. The crests in *I. cypriana* are larger and more quadrate.

5. The leaves are relatively narrower in *I. cypriana*.

6. The habit is very different. *I. cypriana* dies down to a large extent in late summer, and conspicuous shoots, as in *I. sicula*, very closely resembling similar shoots occurring at the same time in *I. susiana*, appear after the autumn rains. *I. pallida* does not die down until winter, and then sometimes partially, but sometimes wholly, no leaves remaining above the soil. It will be interesting to observe the characters of the seeds, which I hope to do in the course of the summer.

I do not think *I. cypriana* can be a hybrid of *I. pallida*—the only possible other parent would be *I. germanica*—and then one would expect a very different coloration.

The root of this fine large new bearded Iris was sent to Kew from Cyprus by Mrs. Kenyon, together with roots of a white Iris, which proved to be identical with *I. albicans* (Lange). The handsome large

flowers make it a welcome addition to our gardens and it has the additional merit of being a late flowerer—the latest of the tall bearded Irises—later than *I. pallida*, and at this moment (July 17) is in flower in my garden at the same time as *I. Monnierii* and *I. aurea*. It is a very conspicuous and pleasing sight at a distance. I can distinctly see the large white beard 30 or more yards off. It has a slight fragrance resembling that of *I. germanica* rather than that of *I. pallida*.

It seems somewhat impatient of autumnal and winter rains, and should, I think, as indicated by the manner in which it shoots in autumn, be planted in a dry position. I fancy that it would profit by being "roasted" in summer, and the extremely free way in which it has flowered this summer is probably due to the, in some ways, beneficent drought of last summer. *M. F.*

*I. BARNUMI*, *J. G. Baker and M. Foster, n. sp.*†

*Rhizome*, slender, fleshy, with the usual characters of an *Onocycylus* rhizome, i.e., the new buds, which appear first in a nipple form, early become separated by a constriction from the old stock, causing the new growths to be discrete, not massed together as in *Pogoniris*.

*Leaves*, five or six to a tuft, about 15 cm. by 1 cm. or less linear, pointed, somewhat falcate.

*Scape*, 3 cm. to 14 cm. in length, one flowered, with a sheathing leaf starting at about a quarter of the length.

*Spathe Valves*, 5 to 6 cm. long, elongate, narrow-pointed, slightly ventricose, longer than tube, flushed with purple at lip and extreme edge, otherwise green, persistently herbaceous long after flowering.

*Fall*, obovate cuneate, 5 cm. long, by half as broad, with no distinction between claw and blade, the latter concave from side to side, sharply reflexed and curled down in the apical third, dark venous red-purple with darker veins; beard triangular, "fluffy," hairs thin, close-set, yellow, tipped purple, many hairs straggling away laterally from the triangular outline of the mass of the beard.

*Standard*: blade, orbicular obovate, connivent, 6 to 8 cm. long by 6 or 7 cm. broad, folded saddlewise, narrowing, at first gradually and at last suddenly, to a short claw, edge crenate, colour red-purple rather lighter than the falls, with more conspicuous veins; a very few hairs on the claw.

*Styles* nearly horizontal, arching over falls; groundwork brownish-yellow, made reddish by red-purple dots and a median-purple streak; under-surface yellow; crests triangular, much recurved, finely serrate, red-purple with deeper veins; stigma with serrate purple edge.

*Antlers* large; pollen yellow.

*Ovary* trigonal, shorter than the long tube.

*Capsule* trigono-ellipsoid. Seeds large, with conspicuous light-coloured strophile.

Flowers in May or June, rather later than *I. ibérica*.

The flowers in a warm atmosphere possess a delightful fragrance. The plant, like other *Onocycylus* Irises, dies down in midsummer if roasted, and shoots again after the autumn rains. In many respects it comes near *I. paradoxa*.

There can be no doubt that in spite of possessing a defined beard, it belongs to the *Onocycylus* group; in every other character, as well as in general aspect and habit, it is an *Onocycylus*.

This plant is a native of the hills, about two hours distant from Van in Armenia. For the possession of it I am indebted to the kind zeal of Mrs. Barnum, of the American Mission of Kharput. She saw the flower while on a visit to Van, and secured roots for me. I have great pleasure in naming it after this lady, who has been indefatigable in sending me Irises

\* *Iris (Pogoniris) cypriana*.—Rhizome brevi, foliis elongatis late ensiformibus glauciscentibus, spathe valvis navicularibus ad anthesis sursum scariosis, floribus generum maxime pulchre lilacis basi albis venis brunneis decoratis, ovario subsessile irregulariter hexagono, tubo subpiloculari, segmentis exterioribus obovato-cuneatis barba subdiffusa pilis lutescentibus purpureo-capitatis, segmentis interioribus orbiculari-oblongis unguiculatis, stylis cristis magnis serrulatis, fructu ellipsoideo-gylindrico. *J. G. B.*

† *Iris Barnumi*, n. sp.—Rhizome brevi; foliis linearibus glauciscentibus semi-pedalis; caule brevi monophyllo; spathe valvis magnis post anthesis herbaceis; perianthii tubo brevi, limbo atropurpureo venis obscuris, segmentis exterioribus obovato-cuneatis barba subdiffusa pilis lutescentibus purpureo-capitatis, segmentis interioribus obovato-unguiculatis exterioribus majoribus; stylis cristis brevibus recurvatis; seminibus magnis conspicue strophileis. *J. G. B.*

from Asia Minor, and to whom we are already indebted for *I. lupina*, *I. reticulata* var. *sophenensis*, a very distinct variety of *I. persica*, and indirectly for other Irises which I believe will prove to be new. M. F.

## SCOTLAND.

### HORTICULTURE AT WEMYSS BAY.

THE beauties of the scenery at Wemyss Bay are well known to the ordinary tourist who visits this famous part of the Clyde during his summer holidays. The several Guidebooks which he may consult give every particular that may be of interest to visitors who come to the district for the purpose of admiring the features of as charmingly varied a landscape as may be found in the United Kingdom. The horticultural tourist, however, has been altogether ignored in these Guidebooks. Any indication of what is professionally interesting to the gardener on holiday finds no place in them—a shortcoming which I commend to the consideration of their compilers, with the view to its amendment in future issues.

Readers of the *Gardeners' Chronicle* who may find themselves in Glasgow for the first time will, if leisure permit, be sure to find their way to Wemyss Bay, the distance to which, from Bridge Street Station, Glasgow, is about 23 miles. The route is chiefly parallel to, and for the greater part of the way is in view of the River Clyde, affording the traveller a fine panorama of the beautiful scenery of Scotland's most celebrated river. The first place of horticultural interest on arriving at Wemyss Bay Station is

#### WEMYSS HOUSE,

the marine residence of George Burns, Esq., one of the founders of the world-famed Cunard line of steamers. It is one of the most picturesque and interesting of the many remarkable residences to be found on either side of the Firth of Clyde. The entrance to the grounds lies to the left from the railway station about half a mile and only some 30 or 40 yards from the shore. The house stands a few feet above high-water mark at one end of a narrow almost level lawn of considerable length, the latter being fringed and interspersed with fine clumps of evergreen and flowering trees and shrubs, among which were such things as *Escallonia macrantha*, choice *Rhododendrons*, *Olearia*, *Ceanothus*, *Clematis*, &c., luxuriating and blooming profusely.

Almost perpendicular from the landward edge of this lawn rises a background of rock to the height of about 112 feet. Viewed from below there is nothing to suggest anything but crags tastefully clothed with shrubs and trees: Austrian Pines, *Pernetias*, *Escallonia macrantha*, the latter at the time of my visit being literally ablaze with the masses of its shining red flowers—*Cupressus*, *Retinosporas*, and many other choice shrubs and deciduous trees intermingling with each other in easy natural fashion. No one looking on the towering height from below could possibly imagine that all this wealth of arboreal growth is a skillfully contrived screen to conceal the existence of a score or more of surprises in the shape of irregular terraces cut out of the solid rock, bowered lawns, grottos, flower gardens in which only such choice herbaceous perennials or alpine plants as harmonise with the features around, Roses, and dwarf alpine shrubs, are permitted a place. From every change of elevation and position is obtained a fresh and interesting view of the lovely landscape, which spreads out in such breadth and variety to the south, the east, and the west. The access to these terraces is by a series of flights of steps from the western end of the lawn, and from the eastern end by zigzag walks of easy gradient, all perfectly concealed, so that no artificial line is visible. The scheme and the execution of the whole is the work of Mr. Henderson, the talented gardener, who commenced operations about twenty-eight years ago, and still lives to enjoy the

work of his head and hands, and the confidence of his venerable employer.

On the uppermost terrace is a fine range of plant and fruit houses, the productions in each exhibit all the marks of skillful culture. The most remarkable of these houses is one devoted to a superb specimen of *Cyathia dealbata*, which, as regards its perfect condition, the enormous length of its fronds, and the size of its head, is perhaps unmatched by any other in Europe. The house is a handsome dome-roofed one, about 30 x 30 feet, and the top of the plant fills the upper space with its noble crown of fronds. The stem is comparatively short, being only about 5 feet in length, but is very stout, as may be imagined from the great size of the crown. This last terrace is, as has already been said, 112 feet above the level of the lawn beneath, and its outer edge only about 100 yards in direct line from the shore of the Firth.

The working out of so much picturesque beauty from bare, barren crags in so limited an area has been no mean feat of landscape gardening skill, and the result seems like a realisation of the fabled Babylonian gardens of Nebuchadnezzar.

The water supply of this and another property adjoining, but lying higher and more landward, is a point that will interest visitors who may have similar difficulties to contend with in their own experience. The only available supply of good water for domestic purposes is a fine spring, situated only a few feet above the shore level, and distant about 1700 feet lineal from the point of distribution, which is 150 feet above the level of the spring. A hydraulic ram is placed by the spring. To prevent waste of the spring-water, an enormous reservoir has been constructed at a higher elevation, into which all the surface-water of the surrounding heights is collected. The reservoir holds about 100,000 gallons, and furnishes the motive-power for working the ram. A fall of about 27 feet gives the necessary power to lift an ample stream from the spring to the point of distribution at the height above named, and there is no waste of the valuable spring-water. The system has been laid down this season, and Mr. Henderson says it works admirably.

#### CASTLE WEMYSS.

Closely adjoining Wemyss House—separated in fact only by a public road—lies Castle Wemyss, the seat of John Burns, Esq., son of Mr. George Burns, and Chairman of the Cunard Company. Here the gardening features are of a broader character. The Castle, a very handsome building, occupies a commanding position on an elevated promontory, from which a most comprehensive view of the extensive and beautiful landscape of the Firth is obtained. Sweeping lawns surround the Castle on the landward side, which have been formed by means of blasting thousands of tons of rock, and are now studded with magnificent clumps of choice *Rhododendrons* and other select evergreens and deciduous flowering shrubs, with here and there fine specimens of *Arcaaria imbricata* and other Conifers of the better classes, along with ornamental trees, which, planted only some twenty-five years, have attained striking and effective dimensions. From the lawns beautiful glimpses of Dunoon and the Ben-More Hills of Arran and Rothesay are obtained through skillfully contrived vistas of trees, which impart to the broad expanse of the waters of the Firth the appearance of a grand inland sea or lake. Rolling terraces in grass sweep from the level of the Castle and the lawns down almost to the shore, and terminate at one point in the not very usual feature in garden scenery of a fine pier standing out in the Firth to form a harbour and landing place for the yacht of the proprietor, who in summer lives almost as much aloft as on shore. At the south-western end of one of the lower lawns, almost on the level of the shore, a spacious tennis-lawn has recently been formed, having—as in the case of forming nearly every bit of level surface on the place—entailed the blasting of enormous quantities of rock. And on one side of the tennis-lawn, embowered amongst trees, stands a fine pavilion in which tennis may be

played, but which may, and often is, fitted up as a ball-room or theatre.

A fruit garden of about an acre in extent, surrounded by buttressed walls clothed in choice Ivies, *Ceanothus*, *Clematis*, *Roses*, and many other ornamental shrubs, stands on the level of the Castle, about 100 yards eastward. The garden is well stocked with standard and dwarf Apple and Pear and Plum trees, and the walls with thriving well-trained samples of the same kinds, along also with Cherries. Crops are usually good, but this year they are only scanty, owing to adverse weather in spring. Among the fruit tree quarters a very useful selection of herbaceous and florists' flowers is grown for cutting. A range of fruit-houses extend along the entire length of the northern side of this garden, in which capital Grapes and Peaches were to be seen in fine crops at various stages. Immediately behind these houses are several blocks of span-roofed pits and houses devoted to plant growing, forcing fruit and vegetables. An excellent crop of Strawberries, the last under glass of the season, was ripening in one of the houses, so as to keep up the supply till the first from the open air came in, which was expected to be realised in a few days from the date of my visit. Melons are successfully grown in pots, Mr. Henderson preferring to do them in that way rather than planted out. Large stocks of decorative plants for room and table purposes, and *Adiantum cuneatum* and other useful Ferns for cutting, are very successfully grown. There is also a choice and thriving selection of Orchids, and a good collection of stove and greenhouse plants. About three acres of land are devoted to vegetable culture at a distance of about three-quarters of a mile from the Castle.

It only remains to be stated that the two places which I have briefly and imperfectly attempted to sketch in the foregoing are both under the management of Mr. Henderson, and that the credit of their charming permanent features, and their perfect keeping and culture, belong to him.

#### KELLY HOUSE.

This fine place is quite close to the Wemyss Bay railway station, and is the residence of Alexander Stephen, Esq., of famous ship-building enterprise. Although an old place, which has for many years been known favourably in connection with gardening, it is at the present time in a transition state, which will in the near future place it in a higher position horticulturally than it ever has occupied. A new residence is in course of erection. It is of princely proportions and style, from the plans of Mr. William Leiper, architect, Glasgow. Situate on an elevated site, it commands a magnificent view of the surrounding scenery. The park is of considerable extent, well wooded. A fine glen traverses a considerable portion of the southern side of the park, in the bottom of which the Kelly Burn, which divides at this point the counties of Ayr and Renfrew, runs its shady course to the Clyde. The kitchen and flower gardens at one point of its course lie on a gentle slope on the northern bank of the stream. A fine range of curvilinear plant-houses in iron extends along the upper side of the flower garden. The latter is of considerable extent, in grass—so extensive and varied, in fact, as to admit of the inclusion of the usual styles of bedding out along with Roses and hardy herbaceous plants and ornamental shrubs separately, yet so blended as a whole as to produce a very fine and pleasing effect.

The commodious house occupied by Mr. George Macbray, the gardener, who is also factor on the estate, is situated at the north-east corner of the flower garden, and is flanked by a long range of Peach-houses, in which excellent crops were in fine promise. A number of plant-houses and pits are accommodated in an enclosure in rear of the latter range, in which were fine stocks of the usual classes of plants for conservatory and room decoration, and for cutting. Very notable among these were a splendid lot of *Calanthes* showing remarkable vigour. The large iron range before mentioned is stocked

with grand specimen Camellias, Azaleas, Tree Ferns, and miscellaneous greenhouse plants.

It is in contemplation to remodel and extend the glass on a scale proportionate with the splendid style of the new mansion. The grounds also will be remodelled and improved in harmony with the character of the same, and hardly a finer field could be found for the display of taste and skill in landscape gardening. A curious object in one portion of the grounds is a *fac-simile* of the hut in which Dr. Livingstone died. The late proprietor of Kelly House was a personal friend of the great African missionary and explorer, and had Chumah and Susi, two of the Doctor's attendants who were with him when he died, some time at Kelly, and employed them to build the primitive-looking hut, which is as much cherished by Mr. Stephen as by his predecessor in possession of the estate. W. S.

## DISEASE OF LILIES.

### PERONOSPORA ELLIPTICA.

In the *Gardeners' Chronicle* for September 10, 1881, p. 340, will be found an illustration and description of a fungus there first illustrated and described by the Rev. M. J. Berkeley under the name of *Ovularia elliptica*. Seven years have passed since this description was written, and I doubt whether any observer other than myself has since seen *Ovularia elliptica* in good form. In ninety-nine cases out of a hundred the perfect fungus is not seen on Lilies dying from the disease, and no trace of it is to be seen on Mr. Berkeley's original examples now at Kew; in fact it is probable that Mr. Berkeley himself only saw the fungus in an imperfect state. No one has said anything new about the fungus since the original description was published, and if any one had ventured to "confirm the *Ovularia*" it would have been a proof that the "confirmer" had never seen it. I have several times seen the conidia or spores upon Lilies, and frequently a mycelium which appeared probably to belong to the fungus. The Lily fungus, as far as my experience goes, does not generally emerge from the stomata, but it usually vegetates as mycelium only within the living leaves and stems. This mycelium grows with such extraordinary rapidity that it will completely destroy a bed of apparently healthy Lilies in a day or two. The Lily stems are left like dead brown sticks, and the leaves hang round the withered discoloured stems like fragments of ragged, brown, sodden tissue-paper. The ravages of the fungus are not confined to the open air, for I have seen its effect upon *Lilium auratum* in greenhouses, but it perhaps preys with the most deadly effect upon *L. candidum*. Various other Lilies are also attacked, and it is probable that no species can withstand the contact of the fungus. It has been seen on *L. superbum*, *L. chalcedonicum*, *L. pardalinum* and others. My neighbours have (happily!) had their Lilies destroyed by wholesale this summer, so that I have had a good opportunity of studying the fungus. I have also been able to produce it in a perfect state by culture, and so to spread it judiciously amongst selected plants. As the fungus seldom produces spores naturally, the mycelium of the fungus is necessarily confined to the interior party of the attacked plants, and this habit of the fungus is not favourable to spreading from one plant to another.

The Lily fungus may be artificially made to perfect itself by cutting a fungus-infested Lily stem in two, whilst the Lily is still in the ground. After a single warm humid night the transverse cut across the stem will exhibit a perfect miniature forest of the so-called *Ovularia elliptica*. Cutting or breaking off the stems of dressed plants therefore greatly aids the spread of the fungus. Now if circumstances have been fairly favourable the fungus growth from the transverse cutting when placed under the microscope, will be seen something like fig. 21, enlarged 400 diameters. The fungus will now be seen to belong less to *Ovularia* than to *Peronospora*, and the parasite may be known as *Peronospora elliptica*.

The fungus is sometimes much more branched than shown in the illustration, and the branches are often much longer, but I have engraved the special specimen on fig. 21 for the reason that I fortunately have the actual example preserved on a glass slide, with all the conidia or spores *in situ*. The illustration shows a single thread emerging from the transversely cut cells of a Lily stem. Now it often happens that the branches of the *Peronospora* get broken off and are seen free as at A, and it must have been from branches like these that Mr. Berkeley reasonably described his fungus as an *Ovularia*. The growth seen at A is nothing but a lateral branch broken from a long stem. It agrees very well with Mr. Berkeley's original illustration in the number of the *Gardeners' Chronicle* above quoted. The spores readily germinate in water or on any damp surface;

another fungus grows on the surface of the leaves and stem, and hastens putrescence; this is *Polyactis vulgaris*, illustrated and described in the *Gardeners' Chronicle* for February 6, 1886, p. 173. A reference to this illustration will show a remarkable similarity between it and the plant before us, but the fungus upon Lilies is different, and enormously larger in all its parts. *Polyactis cana*, a species allied to *P. vulgaris*, has large oval spores, but it seems impossible that *P. cana* could have been mistaken for *Ovularia* by Mr. Berkeley, for Mr. Berkeley was the original describer of *P. cana*. The habit of the fungus on Lilies seems totally different from *Polyactis*, which should invariably grow on plants already rotting; the habit of the Lily fungus, on the other hand, is entirely that of *Peronospora*. The habit of the *Peronospora* of Lilies is considerably like that of *Peronospora interstitialis* of Primulas (see illustration in *Gardeners' Chronicle*, May 1, 1886, fig. 124, p. 564), but whatever decision may be come to as to the name of the fungus of Lilies, the illustration published herewith gives the first exact representation of it.

Hyacinths, Tulips, and other liliaceous plants are probably sometimes destroyed by the fungus here named *Peronospora elliptica*.

In the now familiar scourge of Lilies we seem to have a close ally of the Potato fungus, and one equally difficult to get quit of, as all the involved features of the cause of one disease are repeated in the other. If all infested and dying material is destroyed, it may prevent an attack another year; but unless all Lily growers act in concert, one person's unburnt plants may infect a neighbour's garden, where all diseased material had been carefully burnt or otherwise destroyed. *Worthington G. Smith, Dunstable.* [We may shortly look for the publication of an important series of observations on this fungus by Professor Marshall Ward. Ed.]

FIG. 21.—PERONOSPORA ELLIPTICA: THE LILY FUNGUS.

certain of the spores produce a convolute mass of mycelium as at n, which, on the opening of the spore, protrudes as a germinal thread; other spores or conidia produce zoospores, as at c. When the zoospores are mature the large mother spore opens and the zoospores sail away, exactly as in the case of the Potato fungus, *Peronospora infestans*. On coming to rest the zoospores in turn open and produce a germinal thread.

The resting-spores which the fungus, no doubt, produces, have not yet come to hand; this is probably owing to the retiring nature of the fungus itself, which requires, as I have shown, a little judicious coaxing to exhibit itself in good form. Mr. Berkeley gave no scale to his little drawing in the *Gardeners' Chronicle*, neither did he mention the size of the large conidia; he, however, afterwards supplied this omission in the pages of the *Annals of Natural History*. The spores shown in fig. 21 agree exactly with the size given by Mr. Berkeley. As soon as the *Peronospora* has run its course, and directly the affected material approaches decay,

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 151.)

### ATOMIC WEIGHTS AND SYMBOLS.

THOUGH out of historical order, it is closely connected with this part of the subject to give here the symbols and atomic weights now adopted of some of the elements with which plant study brings us in contact.

Quite as an arbitrary matter, on account of its lightness, the gas hydrogen, H, was taken as a standard of weight, just as we have an arbitrary yard or an arbitrary pound. H being taken as unity—1, we have now the weights as follows:—O = 16, C = 12, N = 14. P (phosphorus) = 31, Ca (calcium, commonly known when combined with O as lime) = 40; Cl (chlorine), 35.5; Na (sodium or sodium), 23; K (kalium or potassium) 39.1.

When a chemist writes, in what is called a formula, CO or Ca, he does not mean any indefinite quantity or weight, but the weight in which the element combines.\* The atomic weight is implied in the symbol. The proportions in which combinations take place are indicated by numerals which it has become customary (though in early chemical papers it was not so) to put after the symbol and below the line. For example, the series of combinations of nitrogen and oxygen mentioned above might be written N<sub>2</sub> O, N<sub>2</sub> O<sub>2</sub>, N<sub>2</sub> O<sub>3</sub>, N<sub>2</sub> O<sub>4</sub>, N<sub>2</sub> O<sub>5</sub>.\* In the first there are 28 parts by weight of nitrogen to 16 parts by weight of oxygen, and in the last, 28 of nitrogen to 80 of oxygen (5 times 16 equal 80). On the atomic theory, this means that two atoms of nitrogen having together a weight of 28, 14 each, relative to the standard weight atom of hydrogen (taken as 1) combine here with five atoms of oxygen, having each a weight of 16 relative to the weight of an atom of hydrogen. As all analyses are based on what the balance tells us, it is important to have a clear idea of how the chemist records his results.

\* It would make this paper too long to enter into the much-discussed question, whether what we call elements are really so. † N<sub>2</sub> O<sub>2</sub> and N<sub>2</sub> O<sub>4</sub> are relatively the same as N O and N O<sub>2</sub>.

It is the same when we use a series of circles and so obviate the use of the numbers below the line.

To represent the last named compound of nitrogen and oxygen there would have to be two circles with N included and five with O, thus:—

With each lettered circle the atomic weight is implied though not expressed.

#### LAVOISIER.

Reference has been made above to the paper by Guyton de Morveau in 1782 on chemical nomenclature. When the wealthy Lavoisier turned his vivacious intellect, yearning apparently for something important to do apart from politics, to the discoveries of Black, Cavendish, and Priestley, he soon put himself in communication with various workers. One day each week he threw open his laboratory, wheremen of such active thought as Laplace, Monge, Berthollet, and Fourcroy used to meet. Priestley, when in Paris, told them of his discovery of dephlogisticated air. Lavoisier was not long in repeating the experiment, and it remains a deplorable fact for his scientific reputation that he spoke afterwards of having made the discovery about the same time as did Priestley. With Guyton de Morveau he was in correspondence. Everything in Paris was being "reformed" (except morals). Lavoisier determined to be the reformer of chemistry. His system was essentially that of oxygen and its compounds. In the new nomenclature, in which De Morveau so helped him, was the leading idea. He worked hard and published much, and made chemistry really a science consistent with what was then known.\* His work made further work more rapidly possible. It raised questions for experimenters. Though his system has been so modified it may be said to be supplanted, much of the nomenclature still lingers. The "reforms" in the State had passed from one stage to another, till, on May 8, 1794, *Citizen Lavoisier* was guillotined in accordance with the views of the then rulers—"La République n'a pas besoin des savants!" Seventy years later (1864) an official publication of his works in four handsome quarto volumes, was commenced, and in these his writings can be conveniently referred to. The description of apparatus and methods in use in his time is especially interesting. *W. S. M.*

(To be continued.)

## FORESTRY.

**NOTES ON THE LONGEVITY OF CONIFEROUS TREE SEEDS.**—Loudon says European Larch seeds will not germinate after they have been a few months out of the cones. Our experience proves that they will germinate perfectly well eighteen months, and passably well thirty months, after leaving the cones. The belief seems to be general that White Pine seeds become rancid and will not germinate after the first season. Our experience proves that they will germinate thirty months after leaving the cones.

I think further experience will prove that the seeds

\* In the paper describing his researches on fermentation Lavoisier enunciated the principle that the weight of the products of any chemical change are equal to the sum of the weights of the products taking part in that change, and that hence chemical changes can be expressed by equations. The fact lies at the root of the "new chemistry,"—new from the period in which he lived as distinct from the pre-Latent period, and chemists still use equations in expressing the changes. For example, calcium carbonate and hydrochloric acid give carbon dioxide, water, and calcium chloride. The equation is written thus:—

since it expresses these facts. The combining weights are of Ca, 40, and of C O<sub>2</sub>, 12, O, 16 taken three times, i.e., 48, 60, together 100. Then 2 H Cl [H, 1, Cl, 35.5, together 36.5; the large 2 means twice this] 73. Thus the sum of the weights 100 and 73 is 173. Then on the other side of the equation we have C O<sub>2</sub> [C 12 and O 16 taken twice] 44, H<sub>2</sub>O [H 1 taken twice, 2, and O, 16] 18, Ca Cl<sub>2</sub> [Ca 40 Cl 35.5, taken twice, 71] 111, and the 44, 18, and 111 together make 173. The sum of the weights on each side of the equation is the same. Experiment by weight first shows what has taken place, and the equation expresses it.

of Colorado Conifers, and seeds of coniferous trees in all dry climates, will preserve their vitality still longer. We had a sack of *Pinus ponderosa* seed from which we sowed five years in succession, and, to all appearance, they germinate the fifth year as well as first. Seeds of *Picea pungens* and *Pseudo-Tsuga Douglasii* have germinated with us, apparently, as well the third year as the first. I regret that we had not seeds to try the experiment longer.

Practice has changed wonderfully during the last half century in this direction, and now, instead of keeping seeds in the cones, they are taken out as soon as the cones are gathered and dried, yet some writers on forest subjects still recommend the seeds in the cones till time for sowing. But how can Fir seeds be kept in the cones? The cones fall in pieces as soon as the seeds ripen. They will hold together, it is true, if collected before the seeds are ripe, but in that case the cones will become mouldy and injure the seeds. There may be a few species of Pines which will keep longer in the cones than out, such as *Pinus Banksiana*, *P. contorta* and *P. tuberculata*, which hold the hard, dry cones on the trees for many years; but these are kinds which are seldom, if ever, used, and of little value. The white and many other Pines, the Spruces and Arbor-vites hold the cones on the trees for a short time after the seeds have ripened, but they shed all the seeds as soon as they are ripe, in August, September and October. I do not see how the seeds can be benefited by being left in the cones after they have ripened, nor how they can be kept as safely in cones as in bags.

It is fortunate for the forestry of this country that seeds of forest trees can be kept for years in this way, otherwise a succession of plants could not well be kept up, for forest trees do not produce seeds every year, even when the seasons are favourable. In the year 1884 I scanned the White Pine trees closely from the head of Lake Michigan to the New England coast, thence from Rhode Island north to the Canada line, thence through the Adirondack Mountains, along the Black River, and into the White Pine regions in Pennsylvania, and saw no trees producing cones. We then sent a collector up into northern Wisconsin and the Michigan peninsula, but he found that the trees were not producing seeds. It is often the case that when forest trees fail to produce seeds in one part of the country they are abundant in another locality; but in this case the only exceptions I heard of were one locality in the Lower Provinces of Canada, and the cultivated trees west of Lake Michigan. What is true of the White Pine is measurably true of all other forest trees, and now, when so much is written on the subject of forestry, it is surprising that it is written on this branch of the subject. Even if the seasons are all favourable one can hardly expect a crop of White Pine seeds often more than once in three years. One year is needed for the fertilising of the male and female flowers and the fertilising of the embryo cones, the next year for the growth of the cones and the perfecting of the seeds, which draws so heavily on the vitality of the trees that they require the third year to recuperate and form blossom-buds to continue the blossoming the year following. Wherever I had an opportunity to examine, as in New England, or the Adirondacks, and in the Pine belt in Pennsylvania, I found the trees all well set with embryo cones, and our collector reported the same for the region south of Lake Superior, and as these embryo cones were already fertilised, we were certain of a crop of seeds the next autumn. Of course, new seeds are safer and better than old seeds, and will germinate quicker. We make it a rule to sow seeds thicker than new, and either to sow them earlier, or to soften them by soaking before we sow them. *Robert Douglas*, in "Garden and Forest."

## FRUITS UNDER GLASS.

**PINES.**—Plants which are colouring must receive careful treatment as regards watering. They must not be kept too wet, neither must they be kept too dry; these two extremes must be specially guarded against this sunless season. Give ample air during the process of ripening, to induce high flavour. Should more fruit than is required turn in, the suckers may be detached from the plants, and the plants with the fruit can be removed entire to a dry, cool room, where they will keep in good condition for a considerable time. Most of the winter fruiters will now have passed the blooming stage, and should receive every encouragement to swell their fruit.

Give them frequent waterings with weak manure. This should be varied, as a plant is found to thrive better on a change of diet. A little weak guano, the drainings from a stable or dung-heap, with occasional applications of Thomson's manure, will be found to answer the purpose. Maintain a genial moist atmosphere amongst the plants by damping the surface of the plunging material and paths. A gentle dew from a fine-rosetted syringe may be given when the plants are being shut up, and a temperature of 95° may be run up, when sun-heat can be secured in the afternoon. When the pinery has been closed for the day the night temperature should not be allowed to fall below 75°, and when the morning presages a fine day, let the fires be kept at the lowest point, and air should be admitted early, and in small quantities, increasing with the sun's power. When full air is on, the house should stand at 85°. Plants which are intended for special treatment in January should now be allowed to rest by keeping the temperature a little cooler and drier. The plants should also receive less water at the roots. The stock of successions should be kept at high pressure in order to get strong plants before the sun's power declines. Never was there a season when shading was more necessary than the present, as there has been no sunshine for several days in succession and when it did appear it was generally for short periods at a time. This is more injurious than steady sunshine and the shade should be run down whenever the sun appears, and be removed as soon as it becomes obscured.

Suckers which were recommended to be detached and dried last month will be ready for a shift into a size larger pots towards the end of the month, as they would be likely to start prematurely if allowed to remain too long in the suckers pots. Shade slightly and keep a moist atmosphere to establish them. Let the night temperature be kept at 75°. When firing is necessary do not syringe too heavily overhead, rather have recourse to damping the surface of the bed and paths.

**VINES.**—Vines from which the crops have all been cleared may now have the top and bottom ventilators kept open night and day. Frequently syringe the interior, to keep the foliage clean and healthy. In such a sunless wet season the mulching of outside borders may be dispensed with. Young Vines which are to be started in January for the first time as fruiters, if the wood is nice and brown, may have all the lateral growths cut out to throw all the vigour into the buds for next year. This should only be done up to the length it is intended to fruit from, which would be about the third year, after the rather where the leader was pinched. The renewal of early Vine borders may now be undertaken where the Grapes have been cut, or are perfectly ripe, as this will give the Vines ample time to make fresh roots, while the foliage is still healthy and vigorous. Commence 6 feet from the front wall of the vinery, by raking out a trench sufficiently wide to allow for proper working. Prick out all the soil from the roots, being careful not to damage them more than can be helped. When all the soil has been removed, the drainage must be overhauled to see that it is in proper condition. Any defects here must be remedied, else all subsequent operations will be in a great measure nullified. If the soil to be used is of a heavy character, a depth of 2 feet 9 inches will be enough for an outside border, but if of a light, porous nature, then 3½ feet may be allowed, but roots at such a depth as this are not such good tenders of the Vine as those which are close to the surface, and in contact with the air. When all is in readiness, commence to fill in the border by placing a layer of turf, grass-side down, and proceed to fill up the border. The roots should be laid out evenly over the surface, which has been made sufficiently firm by treading at a foot from the surface. A mulch of dry straw or a rough litter should be put over the top to retain the warmth in the border, but the temperature should not exceed 85°. The Vines will be all the better for a shade placed over the glass and frequent syringing during the process.

When the Grapes are ripe the temperature must be kept cool, but a little heat in the pipes should be given during dull wet weather. This season late Grapes will have to be largely ripened by means of fire-heat, as on many days there is no sun to assist them. Endeavour to get all late Grapes pushed forward this month, as they do not make rapid progress after the middle of September. Assist them with weak manure where it is necessary to water the borders. Pinch out lateral growths before they rob the Vine of any virtue which should be transmitted to the fruit. *W. M. Baillie, Luton Hoe.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

## APPOINTMENTS FOR THE ENSUING WEEK.

### SHOWS.

WEDNESDAY, AUG. 22. { Newcastle-on-Tyne (three days),  
Shropshire, and Shrewsbury (two days).  
THURSDAY, AUG. 23. { Royal Horticultural of Ireland,  
Aberdeen (three days), Wilts,  
Basingstoke, Calne, and Dun-  
keld.  
FRIDAY, AUG. 24.—Perth (two days).

### SALES.

MONDAY, AUG. 20. { Trade Sale of Dutch Bulbs, at Pro-  
theroe & Morris' Rooms.  
THURSDAY, AUG. 23. { Trade Sale of Dutch Bulbs, at Pro-  
theroe & Morris' Rooms.  
FRIDAY, AUG. 24. { Established and Imported Orchids,  
at Protheroe & Morris' Rooms.  
SATURDAY, AUG. 25. { Trade Sale of Dutch Bulbs, at Pro-  
theroe & Morris' Rooms.

Monthly Stock Taking.

Few things, from a literary point of view, have a less inviting appearance than the Returns issued each month by the Board of Trade, entitled "Accounts relating to the Trade and Navigation of the United Kingdom" for each month during the year. Some 126 pages of figures to the "untrained eye" have a somewhat repulsive appearance, but the "trained" observer will find these pages brimful of interesting facts on matters concerning every inhabitant of the United Kingdom, and Ireland. In very many ways do they concern the horticulturist, the agriculturist—the arboriculturist, the owner or occupier of every acre of ground not covered by bricks and mortar. Something of this will be found set forth in a recent article in our columns relating to a proposed "Agri-Horticultural Council." Something in addition will be found in Mr. DUNN's address to the Scottish Arboricultural Society reported in our last issue. Perhaps the recent great Colonial and Indian Exhibition showed how much the three "cultures" above noted contribute to the world's prosperity, therefore any trustworthy evidence we can produce in favour of any scheme for "self-help" is entitled to some space in our columns. From the "Trade Returns" above noted we learn how much we are indebted to the foreigner and to our Colonial brethren for our "daily bread," and are furnished with an incentive to keep as much as may be possible of our cash at home, and to find employment for what is now termed our "surplus population." Such was not, so far as we are aware, the original idea in publishing these Returns; but then, to suggest a humble simile, no tailor in designing a dress-coat and bifurcations has any idea that they may ultimately serve the (agriculturally) noble purpose of a scarecrow!

The introduction to these "stock tables" con-

sists of "summaries of imports from foreign countries and British possessions," thus:—

	Month ended July 31.		Increase (+) or Decrease (-)
	1887.	1888.	
Animals, living (for food)...	£. 711,061	£. 757,975	+46,914
Articles of food and drink—duty free ...	10,388,986	11,270,117	+881,131
Articles of food and drink—dutiable ...	2,352,383	2,400,647	+48,264
Chemicals, Dyestuffs, and Tanning Substances ...	490,645	511,412	+20,767
Raw materials for textile manufactures...	4,113,202	3,734,640	-378,562
Raw materials for sundry industries and manufactures ...	3,444,180	3,731,094	+286,914
Total value of principal imports*	28,958,156	30,706,412	+1,748,256

These few introductory lines are amplified in other tables, from which we may from time to time make extracts of such items as relate to matters within our scope.

The figures we now lay before the reader refer to vegetable products chiefly, omitting those of purely agricultural interest, and show the consumption of the articles specified in the month ended July 31, 1888, as compared with the corresponding period of 1887.

\* Some sections, not pertinent, are omitted.

We may here recommend to the compiler of these Returns that the plus and minus columns should range with the monthly Returns; the whole matter might then be seen at a glance, and so save turning over several pages each time a comparison has to be instituted.

It will be very easy to extend these figures should it be deemed requisite. Particulars as to sources of supply might in many cases be advantageously supplied, and thus our home-growers and our Colonial fellow-subjects may be made acquainted with details which it is desirable they should know. It may be mentioned that the entries in these Returns increase or decrease as the cheery harvests ripen in the lands beyond the sea.

"BOTANICAL MAGAZINE."—The August number contains figures of the following plants:—

*Trevesia palmata*, t. 7008.—An Araliaceous shrub, with broad fan-shaped, spreading leaves, of noble aspect. The flowers are like those of the Ivy on a large scale, but with a disagreeable heavy smell. It is a native of tropical jungles of the Central and Eastern Himalayas, and of the hot, humid regions of the Khasia Mountains and Chittagong. It flowers every winter in the Palm-house at Kew.

*Echinocactus Haselberghyi*, t. 7009.—This will be esteemed a little gem by lovers of succulent plants. It is the size and shape of a small or medium-sized Orange, and thickly covered with tufts of silvery spines, which cross and interlace in all directions. The petals are small, orange, margined with red. The native country is not known. Hort. Kew.

*Sarcocilus Hartmannii*, t. 7010.—A Queensland Orchid, with fleshy lanceolate leaves, stout, erect, many-flowered racemes, each flower being about three-quarters of an inch in diameter, nearly regular, stellate, whitish, with a few red bars at the base of each segment. The lip is very minute, the fleshy, pouch-like lateral lobes ascending and much exceeding the minute central lobe. Hort. Kew.

*Aristolochia Westlandi*, t. 7011.—This was originally described by Mr. Hemsley, in the *Journal of Botany*. It is a native of the mainland of China, opposite Hong-Kong, and has cordate oblanceolate acuminate leaves and very large flowers, each with a cylindrical tube, bent at an acute angle, and expanding into a flatish cordate ovate limb, 6 inches across, of a creamy-white colour, with a central blotch of purplish-brown, and the nerves of a similar purplish colour. Hort. Kew.

*Narcissus pseudo-Narcissus* var. *Johnstoni*, t. 7012.—A variety with a tubular yellow crown as long as and of like colour with the narrow lanceolate segments. See *Gardeners' Chronicle*, 3rd series, 1887, p. 288.

"KEW BULLETIN."—The August number is taken up with the subject of colonial fruit, and contains information relating to fruit production in the several West India Islands and British Guiana.

JOHN BAIN MACKAY.—We regret to hear of the decease, at the ripe age of 93, of this gentleman, long known in the horticultural world, and a warm supporter of the Gardeners' Benevolent. Mr. Mackay resided for many years at Totteridge, and it was in his garden that the much-contested Abies Lowiana first produced its cones.

KRAKATOA.—Readers will remember the fearful volcanic eruption which in August, 1883, overwhelmed the island. Every trace of vegetation was destroyed. Mr. HEMSLEY contributes to *Nature* an account of Dr. TREUB's recent visit to the island, and of the way in which it is becoming repeopled. The island is only 3 miles across, and rises almost perpendicularly from the sea on one side to a height of 2500 feet, while on the other it presents a steep slope. The nearest adjacent island is 10 miles distant, but 20 fms any source of vegetation. The whole island is now covered with a layer of cinders

and pumice, varying from 1 to 60 metres in thickness; it is uninhabited, uninhabitable, and difficult of access. Winds, waves, and birds have, however, contributed to clothe part of the island with Ferns, of which eleven species were collected. Previous to the Ferns, and preparing the way for them, were fresh-water Algae of various kinds, which supplied a

ment of North-west India has issued a valuable treatise on the grasses used in the plains of North-west India for forage or for fodder. Mr. DUTHIE has collected largely himself, and he has carefully studied the herbaria and libraries within his reach; moreover, he has availed himself freely of the labours of specialists. The genera are arranged according to

ness is not flattering, and the details are too obscure to be of use for discriminating doubtful species.

**BOTANICAL BOOKS.**—Mr. WHELDON, Great Queen Street, W.C., has published a useful list of horticultural and agricultural books, as well as others relating to botany and to forestry.

FIG. 22.—STUARTIA PSEUDO-CAMELLIA: HARDY SHRUB: FLOWERS WHITE. (SEE P. 188.)

hygroscopic property in the absence of which the Fern spores could not have grown. The flowering plants were such as generally take possession of newly raised coral islands, while on the shore were found seed-vessels such as are commonly washed up on the shores of the Malay Archipelago, &c.

**THE FODDER GRASSES OF NORTHERN INDIA.**  
—Mr. DUTHIE, the Director of the Botanical Depart-

ment of North-west India has issued a valuable treatise on the grasses used in the plains of North-west India for forage or for fodder. Mr. DUTHIE has collected largely himself, and he has carefully studied the herbaria and libraries within his reach; moreover, he has availed himself freely of the labours of specialists. The genera are arranged according to

**CROPS IN CORNWALL.**—Those who do not possess a practical knowledge of the subject (remarks the *Cornishman*) have asserted that the recent surplage of rain has had some good results; it has furnished an abundant supply of grass, and favoured roots and Broccoli. Not only is grass plentiful at the expense of nutrition, but Mangels and Turnips have too much moisture, and do not look half so promising as if there was more sunshine and warmth.

The same is said of Broccoli. This crop certainly has not required the costly and tedious hand-waterings it wanted last year to enable the young plant to root and live, but the rain has proved too much either for a thoroughly wholesome look or a satisfactory condition. Then the unusual moisture has encouraged unusual weed-growth. Ground hoed a fortnight only has been thickly covered with weeds. Many an acre of early Broccoli round Penzance is in rows, the soil banked, or "earthed-up," each side the plants. This was done to "turn the weeds down," and so prevent the ground from being, as is seen in level land which has been hoed and hoed again, densely clothed with weeds. These furrows between each row of Broccoli had one good influence on Tuesday in last week; they allowed the heavy down-pour more easily to pass from the fields to drains. In many instances, however, much soil was washed across pathways, drains were choked, and ponds formed in unaccustomed and inconvenient places. Last year the market-garden land was arid; now it is sudden. Last year there was too little rain; this year there is too much.

**EXCURSION TO THE CHANNEL ISLANDS.**—A party of our Belgian friends propose visiting the Channel islands with a view of inspecting the horticultural and agricultural industries of those favoured islands. The route to be taken is Antwerp, Harwich, London, Southampton, Guernsey and Jersey. The party will leave Antwerp on August 24, spend four days in the islands and then return.

**RICKMANSWORTH (MOOR PARK) HORTICULTURAL SOCIETY** (August 15).—This Society held its annual exhibition on the above date. The feature of the show was the magnificent bank of plants contributed by Mr. Deane, gr. to the Earl of Essex; Mr. Condie, gr. to S. J. Blackwell, Esq.; Mr. Myers, gr. to the Earl of Clarendon; and Mr. Bye, gr. to Mrs. Gladstone. Mr. Mundell, gr. to Lord Ebury, Moor Park, set up in a separate marquee an immense collection of representative decorative plants, and a fine collection of vegetables and fruit. Cut hardy flowers were a special feature. Mr. J. W. Odell, gr. to W. Barber, Esq., Q.C., Pinner, contributed a rich collection of over one hundred species of alpine and herbaceous flowers; whilst from Moor Park came a fine collection of perennials and florists' flowers. One entire tent was devoted to wild flowers, nearly a hundred baskets being contributed. The named collections of wild flowers were especially good, and errors of nomenclature few.

**BOTANICAL SOCIETY OF ITALY.**—The first annual general meeting will be held on September 7, on which occasion the Tuscan Horticultural Society will inaugurate an exhibition of fruit and flowers.

**MR. WILLIAM MILLER.**—We are pleased to be able to congratulate our acute correspondent, Mr. WILLIAM MILLER, of Combe Abbey gardens, on the extraordinary success of his son at the recent examinations on board the school-ship *Conway*. We trust such success may be the forerunner of a distinguished career.

**ATHERSTONE HORTICULTURAL SOCIETY.**—On the 6th inst. this Society held a successful show, attended by about 15,000 people, £322 18s. 4d. being paid for admission. The exhibits were so numerous that seven tents had to be erected. Mr. PARKER, of Rugby, took the 1st prize for a group, showing excellent taste. The competition was very keen here. Mr. ALLUM, Tamworth, 2nd. Mr. J. ALBRIGHTON showed Carnations and Picotees. Mr. MAYNARD and Mr. FORSEY were very successful in the fruit classes.

**CONFERENCE ON FRUIT CULTURE.**—We have received from Mr. F. W. FAIRGRIEVE, Dunkeld Gardens, a programme of a conference on methods of fruit culture in that district to be held by permission of the Dowager Duchess of Argyll in the Dunkeld Gardens on the 31st inst. A strong committee

has been appointed, with Mr. M. DUNN of Dalkeith as Chairman, who, after the fruit-houses and gardens have been inspected by the visitors, will deliver an address on fruit culture, to be followed by a discussion, and any questions concerning culture and varieties of fruit in Dunkeld and district will be answered by Mr. FAIRGRIEVE. The invitations to take part in the conference are limited in number.

### STUARTIA PSEUDO-CAMELLIA.\*

ACCORDING to the *Genera Plantarum* there are but three species of this interesting genus. All are decidedly handsome plants, and are amongst the most desirable of ornamental flowering trees or shrubs. Two are North American, viz., *S. pentagyna* (*Botanical Magazine*, 3918), syn. *Malachodendron ovatum* (*Botanical Register*, 1104), and *S. virginica*, of which a full-page engraving appeared in these columns for October 6, 1887, p. 433. The Japanese species now figured (fig. 23, p. 187) flowered in the Coombe Wood nurseries of Messrs. Veitch, and was exhibited by them at one of the recent meetings of the Royal Horticultural Society. As yet, as far as British gardens are concerned, *S. pseudo-Cameelia* is a rare plant, although it has been cultivated on the Continent for many years. The specimen from which the figure in the *Revue Horticole* was prepared fruited in 1878, at Secau, in the nurseries of Messrs. Thibaut & Keteleer; this firm bought it from Siebold about ten years previously, on the occasion of the first International Exhibition at Amsterdam. Three years ago flowers were produced by a bush trained to a wall in the nurseries of Rodger, McClelland & Co., at Newry.

The following extracts are taken from a Japanese folio which gives very nice figures of many fine Japanese shrubs and trees; its English title is "Figures and Descriptions of Plants in the Koishikawa Botanical Garden. By Keisuke Ito, 1883." "The plant is found wild in Huyeizan (Yamashiro), Hasedera (Yamato), Nikko (Shimotsuke), Kurotakisa (Omi), Komono (Ise), and also in some mountains of Kiusiu. It is a deciduous tree with alternate leaves and branches. Its height is more than a jo. Some are large enough to require both arms' length to embrace the trunks. The bark is of a reddish-brown colour; the outer bark peels off in scales. The tender branch is of a pale green colour having reddish spots. Leaves are short-stalked, oblong, about three sun in length, acute, crenate, and rough. . . . Flowers are five-petalled, pure white, lovely; they resemble in shape those of the *Tsubaki* (*Camellia japonica*), hence its name." *G. Nicholson*.

### SOCIETY OF AMERICAN FLORISTS.

THE following is the programme of the meeting to be held next week in New York, and which we print as furnishing suggestions which might be adopted here with advantage:—

**TUESDAY, AUGUST 21: Morning Session, (10 o'clock).**—Address of Welcome;—Response;—President Hill's Address;—Reports of Secretary and Treasurer;—Reports of Standing Committees;—Reports of Special Committees;—Miscellaneous Business;—and Discussion of President's Address.

**Afternoon Session (3 o'clock).**—Essays:—"The Elevation of Our Business," by H. H. Battles, Philadelphia, Pa.; and "Ferns, Palms, and other Decorative Plants," by C. D. Ball, Holmesburg, Pa.

**Evening Session (8 o'clock): Question Box:—**

1. What benefit is derived by florists from a scientific education. Answered by A. E. Whittle, Albany, N. Y.
2. Is the sale of Chrysanthemums an injury to the cut flower trade? Answered by J. M. Jordan, St. Louis, Mo.
3. Is a wholesale market for the sale of cut flowers desirable in our large cities, and if so, what is the

best manner of organising and conducting such? Answered by J. C. Vaughan, Chicago, Ill.

4. Horticultural Exhibitions: what is their value to the florist, and what can be done to render them more profitable and popular? Answered by John Thorpe, Pearl River, N. Y.

5. Can *Ixoras*, and other flowering stove plants, be grown so that flowers can be sold at a profit? Answered by John G. Gardner, Jobstown, N. J.

6. What varieties of Orchids are of easiest cultivation and most profitable for florists who are not professional Orchid growers? Answered by Benj. Grey, Malden, Mass.

7. What are the best varieties of Ferns to grow for general retail business? Answered by Robt. Craig, Philadelphia, Pa.

8. Which are the most desirable varieties of Chrysanthemums to grow for cut bloom for market, including the earliest and latest varieties? Answered by John Henderson, Flushing, N. Y.

9. What are the best six Carnations for the general florist to grow—colours red, pink, yellow, and white? Answered by Charles T. Starr, Avondale, Pa.

10. What is the best way to propagate *Acacia pubescens*? Answered by Robt. J. Halliday, Baltimore, Md.

11. Is the mail trade in plants an injury to the general business? Answered by Robt. George, Painsville, O.

**WEDNESDAY, AUGUST 22: Morning Session (10 o'clock).**—Nomination of officers for the ensuing year.—Essay, "Roses: from the Retailer's Standpoint," by Thomas Cartledge, Philadelphia, Pa.

**Afternoon Session (3 o'clock).**—Essay, "Roses: from the Grower's Standpoint," by Edwin Lonsdale, Chestnut Hill, Pa.; and "Report on Hail Insurance," by J. G. Esler, Saddle River, N. J.

**Evening Session (8 o'clock): Question-box:—**

1. What varieties of Roses introduced within the last two years, if any, are worth growing for winter forcing? Answered by M. A. Hunt, Terre Haute, Ind.

2. What are the best and most profitable varieties of Hybrid Perpetual Roses to grow for forcing for early and late use for general florist? Answered by Ernst Asmus, W. Hoboken, N. J.

3. How many varieties of Tea and Hybrid Tea Roses are necessary for the general grower; and which are the best varieties to grow? Answered by J. M. Gasser, Cleveland, O.

4. Does propagating from blind shoots year after year have a tendency to render any plant less floriferous? Answered by Jas. Pentland, Baltimore, Md.

5. Can *La France* and other Roses be forced profitably in pots during winter? Answered by W. K. Harris, Philadelphia, Pa.

6. Why do certain Roses, such as *Perle*, *Souvenir*, &c., that used to be favourites for forcing, now seem to grow less satisfactory every year? Answered by M. A. Hunt, Terre Haute, Ind.

7. Will the larva of the Rose-bug stand freezing? In other words, is it safe to spread infected soil taken from the greenhouse and grow sod upon it for future use? Answered by Robert Craig, Philadelphia, Pa.

8. Are we not overdoing the Rose business for cut flowers? Answered by B. P. Critchell, Cincinnati, O.

**THURSDAY, AUGUST 23: Morning Session (10 o'clock).**—Election of officers:—*Essays*, "Soils and Fertilisers," by J. H. Taylor, Bay Side, N. Y.

**Afternoon Session (3 o'clock).**—*Essays*:—"Modes of Heating and their relative Cost of Construction and Operation," by J. D. Reynolds, Riverside, Ill.; and "Nomenclature," by Robert J. Halliday, Baltimore, Md.

**Evening Session (8 o'clock).**—*Question Box:—*

1. What is the best method of preserving wood in greenhouses? Answered by S. Kehrman, jun., St. Louis, Mo.

2. What is the best mode of building horticultural halls, with a view to cheapness of construction, plenty of light, and adaptability to exhibition of plants, flowers, and fruits? Answered by J. N. May, Summit, N. J.

3. What has been the result of slate benches the past season; and effects of same on plants planted out on them? Answered by John Smith, Yonkers, N. Y.

4. What is the best insecticide for general use in the market to date? Answered by Robert Craig, Philadelphia, Pa.

5. Has the use of greenhouses constructed entirely of iron and glass been satisfactory in this country? Answered by F. A. Schmitt, Glenville, O.

\* Maximovitch in *Mélanges biologiques*, p. 201 (1363); *S. grandiflora*, Briot in *Revue Horticole*, 1879, p. 430 (coloured plate).

6. The uses of the thermometer and the hygrometer in plant-houses? Answered by Charles P. Anderson, Flushing, N.Y.

7. What is the best way to use natural gas in flues and under steam and hot-water boilers? Answered by J. B. Ferguson, Pittsburg, Pa.

8. Insuring Greenhouses: what companies assume risks of this kind on stock and houses? Answered by J. N. May, Summit, N.J.

N.B. The Question Box, as heretofore, will form an important part of the proceedings. Most florists have questions to ask. Don't be afraid to write them on your business card and drop them in the box. The President will appoint competent members to answer them at the first convenient opportunity.

FRIDAY, AUGUST 24.—The New York Florist Club will tender an excursion to the Society, and hope that every member will so arrange his plans as to accept of their hospitality.

## HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**LIFTING DAFFODILS.**—From the opinions and experiences which have been advanced on the above subject, it is obvious that most growers are adopting Mr. Burbidge's suggestion of following out in practice what seems to suit individual circumstances, and seeing the difference of soil and climate, it would not be prudent to work otherwise. Deep and shallow plantings are indulged in, as are also annual and triennial lifting, with equally good results on all sides. Growing them with and without manures has also received attention, and successes scored by both. What a very accommodating plant, then, is the Daffodil! Were I planting them upon a naturally rich fertile loam, I would certainly avoid the use of crude manures, or may be manure of any kind; but on the contrary, had I to plant on a very sandy, or light stony or gravelly soil, I must certainly would employ raw cow-manure—and plenty of it—till my land bore evidence of being able to grow a crop worth the soil with which I have to deal was formerly a meadow to which manure of any kind had been a foreigner for many years. It is of fair depth, varying from 18 to 20 inches of good soil, followed by a thin stratum of sandy marl, and below this a deep bed of fine gravel. In times of drought the surface will become dust dry several inches deep, while an impervious crust forms on the surface when heavy rains are succeeded by hot sun. A year or two back it was as poor as it well could be, but repeated heavy dressings of cow manure have put it, to use a gardener's phrase, "in good heart." Such, then, is the soil upon which our Daffodils are grown, and the results which I have obtained amply justify the treatment accorded them. Last week I lifted a batch of the Tenby Daffodil, planted in September, 1886, being the refuse of a collected lot, the bulbs weighing on the average less than three-sixteenths of an ounce: the single-bulb ones weigh on an average 13 ounces, while those which have become breeders, have from two to four good-sized offsets, would weigh much more. Emperors are simply marvellous, some of the stock bulbs of which contain five and six fine offsets and weigh upwards of 12 ounces. Many other sorts are equally fine, and among these Horsfieldi deserves mention. These were all planted in the autumn of 1886, but were examined last year and I decided that they should remain, for the reason that the offsets were small, and it was considered that these latter would make greater progress attached to the parent bulb than if separated from it, and which is now proved to my satisfaction. To have left these a third season would be committing a serious error, for by that time all the best offsets will make grand flowering bulbs for sale, therefore the advantage of an annual examination to see the progress made and then be guided according to individual circumstances and requirements. I do not at present see the use of annual lifting or the benefit accruing from it, but am of opinion it is most likely to benefit the breeders if any, and only such of these which make good offsets in one season, and of sufficient size for detaching from the parent bulb. I cannot see that merely lift-

ing, cleaning and transplanting is likely to produce any marked improvement, for the bulb of a Daffodil is not so gross feeding as to impoverish the soil about it in one or even two seasons. To give the matter a fair trial, however, I have selected a variety of sorts, and intend treating them as Mr. Walker recommends and carefully note the results. A word of warning in conclusion: any of your readers who contemplate lifting their Daffodils this season and have not done so, should see to it at once, as some varieties—the earliest flowered ones in particular—have commenced fresh roots without losing the current year's foliage; a state of things evidently brought about by the successive and continuous rains of the present season. E. Jenkins.

—I did not take part in a recent discussion on this subject, because I was at the time engaged in making observations about it. I had a fine bed of hybrid Daffodils called Bernardi, which flowered well and seemed in every respect healthy. When the leaves began to turn at the beginning of July I dug up part of the bulbs, and I stored them in open well-ventilated wooden trays, such as Mr. James Walker uses, the pattern of mine being taken from his, and put them in an airy shed. The greater part of these lifted bulbs are now soft, and either partly rotten or likely to rot when planted again. Those left in the ground are perfectly sound, and firmly rooted with growing roots. My inference is this:—as long as the soil is wet, the root-action is inactive, even after the leaves are quite dead, and enables the bulb to get rid of its superfluous moisture into the soil. But if the bulb is dug up and the root dried off, it is unable to get rid of its superfluous moisture by evaporation, and it rots. It is a question therefore whether in a wet season it is not better to leave all Daffodil bulbs in the soil. I send specimens, and should be glad if the Editor would briefly report on them. C. Wolley Dod. [The specimens sent amply confirm the above statement. Ed.]

**THE POTATO CROP REPORTS.**—I fear many a gardener, whose report as to the earlier appearance of the Potato crop appeared in a recent issue, will feel that there is now a wide difference between the anticipation and the realisation—that, in fact, the freshness and vigour of the Potato breadths have given place to disease and decay. I would venture to suggest that in future the reports upon the Potato crop should be furnished fully a fortnight later than usual, indeed should be as nearly as possible all written during the first week in August, or even a little later. The disease in its virulent form usually appears suddenly and spreads rapidly, so that breadths apparently healthy in one week may be blackened the next week. This year I found that the tops stood wonderfully well through the heavy rains, in spite of the terribly sodden condition of the soil, but when one or two warmer days were succeeded by dense mists at night, the Peronospora then spread with marvellous rapidity. The inference is that, assuming the atmosphere at certain seasons to be rife with the fungoid spores, heavy rains wash them from off the foliage, whilst mists and a quiet atmosphere induces not only the settling of the spores on the foliage, but also rapid fertilisation. Generally, all through this district now (August 11) Beauty of Hebron, Early Rose, and some other first earlies have lost every leaf; second earlies are still losing their leafage, and late ones are still in the bud, just in proportion to their being late planted and immature. Thus a day or two since I saw a huge breadth of Early Rose, or Beauty of Hebron, without a green top, whilst close by was another big breadth of a later kind, green and fresh, as though the Peronospora was a fiction. The proportion of diseased tubers so far, I learn, is not large, but it is comparatively early for the tuber development of the disease in any considerable way; still, should it turn out that, in spite of the considerable fungoid destruction of leafage, the tubers are not materially affected I shall ascribe the result to the heavy beating by rain which the soil has received, which has rendered the surface almost impervious to even the minute spores; that, however, has to be proved. I would urge all gardeners when lifting their crops first to let the tops die away, if not cut off or pulled. There seems to be no doubt but that disease-spores are present in the air until the tops are quite dead, and the tubers cast out upon the surface of the soil, especially when, as now, the skins are thin and tender, are apt to become affected quickly. Of special interest would be the results of general observation as to which tubers were found on lifting to be most diseased—

whether those nearest the surface, or those portions of such tubers nearest the surface, or those nearest the main stems. The result may help to throw some more light upon the point as to how far disease in the tubers is generated through the plant stalks, or through spores washed into contact with the tubers through the soil. One thing the season so far has made specially obvious is that certain conditions of maturity seem to favour the spread of the disease in the Potato plants, and why that should be so is well worth inquiry. That such is the case is evident when late Potatoes, yet fresh and full of vigour, are seen side by side with rows of early kinds, which have hardly a green leaf left on them. A. D.

**HYBRID PITCAIRNEA.**—In the spring of 1887 I crossed Pitcairnea punicea with the pollen of P. staminea. The plants—about forty—raised from these seeds, are all flowering just now for the second time. Some of the seedlings resemble the parents. As every one knows, Pitcairnea punicea is a real pygmy in the family of the Pitcairneas. The flowers of my seedlings do not resemble the flowers of the parents. The plant is a very robust growing one and as a green foliage plant I think that they are equal to three-year seedlings of Dracena indivisa. My Pitcairneas grow very well in rooms and consequently are very suitable for furnishing purposes, but the prettiest state of the plant is when it is in flower. The flower-spike is of a greenish-red colour at the base, which became reddish-crimson at the top of the spike. The flower-spike itself, from the fresh flower branchlets to the top of the spike, is between 42 and 45 centimetres long; the whole flower-spike, from the leaves to the top of the spike, being between 65 and 70 centimetres; the whole plant, from the pot to the top of the flower-spike, being between 110 and 125 centimetres. The flowers are of a very bright crimson; the leaves of the plant vary in length between 60 and 115 centimetres; they are dark green, the under part of the leaves, as well as the whole flower-spike, being covered by a cottony substance, as in well-known Pouteria maidifolia. I call my plant Pitcairnea Bardenia X, and I am sure that it will very soon be a favourite. I enclose photograph of the plant in flower. E. Bardi. There are thirty or forty species of Pitcairnea of this style, which are closely allied to another. So far as the photograph, the plant might be P. angustifolia, Sw., or a near ally. J. G. B.]

**THE HEDGEHOG'S CRY.**—Recently, for two nights in succession, a shrill cry was heard in proximity to my residence, which was variously attributed to "some bird," or to the son of a neighbour, supposed to be amusing himself by whistling into the barrel of a key. Greatly as the sound resembled the latter source of melody its frequent repetition during the late hours of the night at length necessitated the abandonment of that hypothesis. In the strict spirit of science hypothesis was now exchanged for practical experiment, in the hopes of revealing the "why?" A lantern was procured, and guided by the apparent source of the sound, the investigator was speedily directed to a brick area surrounding the basement of the house. The bottom of the area is about 4 feet below the surface of the garden and cemented at the bottom. There, crouching, in one corner, the musician was captured, the lamp was turned on him and thus was revealed a hedgehog. The first proceeding of the captors was to give the poor captive some food, of which judging from his eagerness to partake, he stood in need, and, then to search available books to see what was said therein of the vocal powers of the animal. Neither White of Selbourne, nor Bell (also of Selbourne) says one word about this subject, and hence my note of inquiry to your readers to know their experience. For my own part it is the first time that I have heard

"The voice of the hedgehog;  
I heard him complain."

Since a bed of hay has replaced the cold stone, and a supply of food has been provided, he has been as mute as a turtle. It is interesting to note that Bell in his *British Quadrupeds* alludes to the power of the hedgehog to fall down dead without injury to himself. *Hystrix*.

**CATALPAS.**—During a recent visit to the Botanic Gardens in Brussels, I noticed a Catalpa tree loaded with thousands of blossoms, and, judging from its size and height, it must, one would think, have been planted shortly after the introduction of the tree into Europe, viz. (as authors say), in the year

1726. It, however, seems a wonder to me why such a beautiful tree is so seldom seen in English gardens. It has one special recommendation, that whereas other trees have finished blooming, the Catalpa in August is in all its glory. Thus last August I noticed a very fine one in the public garden at Richmond lately owned by the Duke of Buccleuch. I have not seen more than half a dozen of these trees in England during the last twenty years. It will grow in London, for there, is or lately was, one in Park Lane. I planted two several years ago in the grounds of the Lock Hospital, in the Harrow Road, and two in the gardens of the Athenæum, Morley Hospital, Wimbeldon, and these have done well. I believe other trees, for its scarceness is that, like my favourite Tulip tree, it does not blossom till several years after being planted, but, independent of this, the golden-leaved variety deserves a place in gardens for its beautiful foliage. I treat it as I do the Tulip tree for the first two or three years after transplantation—I have a matting or hay band placed over it during winter. With some protection the tree would do well in the Southern Counties. In some parts of Belgium I noticed specimens of what I supposed were the variegated forms of *Acer polymorphum*, encircled by plants of Purple Hazel, which had a very pretty effect. *John Colebrook.* [The Catalpa is a good town-tree, but apt to lose its branches. Ed.]

**POTATO DISEASE.**—As is well known, the fungus which causes this disease is seldom seen till the end of July or the beginning of August. Until the end of July nothing whatever was seen by me of it here, but during the first days of August a few purple-black flecks appeared on the Potato leaf-tips with the mildew beneath; the two sunny days of last week dried the fungus temporarily. To-day (Sunday) I have been over the workmen's garden plots; now the fungus is general—no varieties are free, and a few plants have already fallen into rot. At this time the weather is all in favour of the fungus, and the Potatoes are at a disadvantage, for the wet summer has caused a great development of juicy haulm. Some of the Potatoes were lifted here last week, and I now observe the fungus-infested haulms (some still green) neatly laid in heaps at the plot corners, the white fungus itself being quite visible to the unaided eye: other blight-stricken haulms, on the paths, to be trodden in—still others are laid on another upon heaps of stable manure, ready for digging into the ground. The fungus is not at its worst yet; it is only just commencing operations, but I do not remember seeing it in a more general or threatening condition. *W. G. Smith, Dunstable.* [It is time that the labourers and growers generally should be taught the criminality of their carelessness. Ed.]

**FRUIT CROPS AT WORKSOP.**—The sandy soil of this district is unfavourable to the cultivation of the Apple, and it is only by the admixture of clay loam in the borders, and by frequent waterings with liquid manure that anything approaching success can be hoped for. The form of trees which obtain mostly with us is that of the bush, grafted on the Paradise and free stocks. Owing to the exceptionally cold spring and the almost complete absence of summer weather the crop, though fairly plentiful, will be late, while the fruit is small. The dessert varieties that find most favour here are Cox's Orange Pippin—in my opinion one of the best flavoured Apples cultivated in this country—King of the Pippins (also a good variety), Margil, Ribston Pippin, Worcester Pearmain, Maltster, and Mr. Gladstone, the latter variety not inappropriately named for its vigour and fertility, though it unfortunately lacks the resistance to early decay of its namesake. Dutch Mignonne being a sure bearer and a heavy cropper, I would strongly recommend for market use. Radford Beauty also finds favour with us, on account of its late keeping property, while the fact that it is a sure and heavy cropper and of fairly good flavour is an additional recommendation. Of culinary varieties the most successful are Lord Suffield, Keswick Codlin, Cellini Pippin, Lord Derby, Eckinville Seedling, Warner's King, Dumelow's Seedling, and Cox's Pomona. Pears are an abundant crop, but like the Apples, are backward. The late varieties, unless favoured with more sunshine during the autumn, will be worthless. Doyenné d'Été, Williams' Bon Chrétien, Clap's Favourite, Louise Bonne de Jersey, Beurré Hardy, Beurré Clairgeau, Beurré Diel are amongst the best. Clap's Favourite is scarcely ever a failure here. The crop is usually abundant, the appearance of the fruit is attractive, while in flavour it surpasses Williams' Bon Chrétien. Peaches and Nectarines

are a good average crop, while Cherries, both sweet and Morello are above the average. Plums and Apricots are almost a failure. Strawberries are an abundant crop, Vicomtesse Hericart de Thury taking premier honours again this season. The other small fruits have on our heaviest crops, red Currants holding a foremost place. The leaves unfortunately have become diseased, with the result that in a few weeks the trees will be completely bare. The leaves of the Pears are similarly affected, but not to the same extent. In Potatoes the early varieties have been a good crop, though the quality of the tubers was greatly deteriorated owing to the incessant wet, while the appearance of later varieties is all that can be desired. The disease has not hitherto appeared. In the noted fruit-growing districts of East Markham and Luford the crops are very variable in their character, apparently depending on the position of the orchard. Apples do not reach the average standard, while Plums, in some instances a very heavy crop, are in other cases a comparatively poor yield. Cherries generally (both sweet and Morellos) are a good crop. Owing to the continuous downpour of rain when the fruit was almost ripe, the former suffered considerably from cracking. Strawberries are a good crop, but had to share in the general havoc caused by the continuous rain, the great bulk of the fruit having rotted before an attempt could be made to gather it. What struck me most in making a short tour through the above districts was, that though some tons of jam were annually manufactured, yet no attempt had hitherto been made in the produce of Cider. In these days of general agricultural depression I think this is an industry deserving attention, while others fail to see the reason why the bottling of such fruits as Plums, &c., should be almost entirely monopolised by the French and Germans. To give emphasis to my remarks, I may add that 488 tons, 7 cwt., 3 qrs. of Plums were put on the railway at Tutford and East Markham in 1886, while the yield of the following years, if not greater, was at least of equal quantity. The figures given do not by any means represent the quantity grown in these districts, as much of it found its way into the neighbouring towns by conveyance other than rail. I would draw the attention of the fruit growers of these districts to the approaching Conference of Fruit Growers at the Crystal Palace (on September 7 and 8), where the various methods of preserving fruit will be treated by the best men, and the adaptability of the various fruits to each system of preserving will be thoroughly explained. *M. Gleeson, Clumber Gardens, Worksop.*

**HOLLY TREE.**—On visiting Kirk Michael House on the 6th of this month, I was greatly surprised when Mr. Shannon, the gardener, drew my attention to a Holly tree still carrying a full crop of last year's berries, as well as a crop for this year, a sprig or two of which I send you. From what Mr. Shannon says, the tree has never before been known to do this. *J. S. R.*

**ADIANTUM FARLEYENSE.**—I have this morning received from Mr. William Goldby, Edgeland Nurseries, Brierfield, Burnley, a frond of this beautiful Fern, cut from a plant (one of a batch of twenty-one) grown by him from spores of his own sowing. It is the first I have ever had, and Mr. Goldby's communication was highly interesting to me, all the more so as I have on several occasions in past years written on this subject in your columns, having failed, after more than twenty years' experience of growing this Fern in all sizes, to find even a trace of fructification. Mr. Goldby tells me that the spores were found on one frond only of a large plant belonging to Mr. Edward Eckroyd, of Edgeland Hall, and that even on this they were scantily found. He intends to exhibit some of the young plants at the Royal Horticultural Society's September meeting, and it is to be hoped that he will then furnish full details of the way in which he raised them. I wish I could have seen even one solitary specimen of the pinna in fruit, so that I could have preserved it. Seeing is believing; and I need hardly add, that I cheerfully accept every word Mr. Golby has written, and I am greatly obliged to him for his courtesy in thinking of me, and writing to me. He is to be heartily congratulated on his success. *T. M. Shuttleworth, F.L.S., F.R.H.S., Preston, Lancs.*

**CLEMATIS JACKMANNI ALBA.**—I have read with interest Mr. Noble's note, p. 152, concerning the above, and regard it as an excellent exemplification of the value of patience and perseverance. I now give my experience of the variety in question. In the autumn of 1885, or spring of 1886—I forget which—I planted

a young plant against the east side of the mansion here, with the result that two or three weak growths, about 4 feet long, were made during the summer. Last year these produced a few flowers of the character described by Mr. Noble, viz., semi-double, solitary, and of a bluish French grey; and although I cannot say I disliked the flowers, my employer and myself thought it inferior to Lucy Lemoine—a double white variety of the Florida type—at the time, and did not regard it as an acquisition. The plant gained vigour, and made young shoots 10 to 12 feet long, which, in their turn, produced an abundance of pure white single flowers in September, and which were much admired. This circumstance, however, was rather a puzzle to me, and I was asked the question "Why is it that the flowers are single and pure white, whereas the others were nearly double, with a bluish tinge?" It was certainly difficult to answer the question offhand, and I was obliged to fall back on the stereotyped reply, "It is one of those variations in Nature which sometimes occur and cannot be accounted for." Mr. Noble's note, however, is a clear exposition of the why and the wherefore, and I for one tender him many thanks for sending it to your columns, and for this grand introduction to our gardens. Seeing that our plant made such strong growth last summer we were looking forward with interest to see if its behaviour would be the same this year, but we have been doomed to a certain amount of disappointment, the severe frosts of January having killed it down to the ground. In the spring two or three young shoots were seen to be throwing up from near the base; one of these has already attained a height of 14 feet, and is showing an abundance of flower-buds, which promise to give us a fine display in another week or two. Can any of your readers say from experience if it will live through a severe winter if grown on a south wall, i.e., wood of the previous or current year's growth? Our situation is low and damp, and subject to late spring frosts; on a south or west aspect we find Lucy Lemoine and other varieties of the Florida and patens type too tender to withstand severe winters. *J. H.*

**SUTTON'S ROYAL JUBILEE PEA.**—As this Pea becomes better known it is sure to be extensively cultivated, as it is suited alike for the poor man's and the rich man's gardens, and as an exhibition Pea it has few equals. It is a vigorous grower, and although the height of the haulm is given in Messrs. Sutton's catalogue as from 3 to 4 feet, it has this year attained a height of 6 feet—a surface-dressing of rotten dung to the thickness of 6 inches having been laid on both sides of the ranks when transplanted out of pots, in February, the haulms being heavily laden with large, handsome, sword-shaped pods, containing from nine to twelve large and deliciously-flavoured Peas each. All being well, I shall grow Royal Jubilee largely next year. This year the ranks of it are the admiration of all who see them. *H. W. Ward, Longford Castle.*

**MILNE'S PATENT SADDLE BOILER—A CORRECTION.**—In reference to the above boiler on p. 161, I find I have made a slight error as regards the room required to set it in, which in reality is as follows:—4 feet in depth, 5 feet in width, when set by itself; but if two are placed side by side somewhat less, and 5 feet 6 inches in length. The boiler itself is 4 feet long, 3 feet 5 inches wide, and 2 feet 4 inches in depth, thus commanding a considerable area for external flues should occasion require, and which would add materially to its existing heating capabilities. This is, however, a very simple matter, and could be adopted or dispensed with at will. I believe I am correct in saying that all those at present in use have no external flues, and I may also remark that all internal flue tubes are cast independent of the boiler itself, and are inserted and caulked in the usual way. *J.*

**HARDY FRUIT TREES.**—Our good friend and veteran horticulturist is hereby exonerated in full for his "Essay at Correction" (*Gardeners' Chronicle*, p. 161) of my article on "Hardy Fruit Trees" (*Gardeners' Chronicle*, 3rd series, vol. iii., p. 615), and I hope he will forgive me if I still adhere to my statement that some of the very best and most fertile of American Apples are not European introductions but seedlings from these introductions raised in America. To begin, I find Mr. Meehan not precise in his arguments against my paper. First he tells us that there have been no introductions of Russian Apples to America up to within the last ten years, and then in enumerating the best half dozen kinds of Apples grown in Canada (Ontario), he names at least two full-blooded Russian kinds, viz. Red

Astrachan and Duchess of Oldenburg, in the list, and these two kinds have long been naturalised in Canada, and Canada to me is simply a portion of the American continent. The fact is that Apples have been introduced to America "from Prussia and other parts of Northern Europe," including England, Germany, Holland, and France, for centuries, and all records of the transfer being lost some of them now figure as "of unknown origin," or as those "accidents" of which Mr. Meehan so often writes (on p. 161), he apparently being unable to put his finger on the name of any seedling Apple of undoubted American origin, although many such are mentioned in Downing's *Fruits and Fruit Trees of America*—a book far too rarely met with in the library of the English gardener. My own belief implicitly is that the best fruits for any climate and locality are those raised from seed in such climate or locality, either from wild species, or from such improved varieties as have succeeded exceptionally well after naturalisation; it follows that I recommended systematic hybridism and rearing of seedlings, instead of the "accidental" or "happy-go-lucky" plan which Mr. Meehan implies has hitherto been the rule in America. My original article was reprinted with favourable editorial comments as a leader in the *Garden and Forest*, and soon afterwards I was delighted to learn that Apples and other hardy fruits from Russia and other parts of northern Europe had quite recently been introduced by Professor Budd to the new experimental stations or Government gardens and trial grounds now organised and working in several, if not all the American States. In a word, accidental progress in America is, it seems, giving way before organised method, and the good results likely to attend these centres of culture can scarcely be overrated. John Dominy, the celebrated and original hybridiser of Orchids and Nepenthes, did much for us in England in a lifetime happily still healthy and vigorous, yet he once said that an hybridiser should have nine lives, like a cat, instead of only one, seeing that we must often await results for many years. Now it seems that the work of these experimental stations, if carried on persistently from generation to generation, and if the records be duly kept will be the best way of solving the "*ars longa, vita brevis*" difficulty to which Mr. Dominy alluded in his practical and homely manner. I am not a little surprised at the list of American Apples (on p. 161), which Mr. Meehan describes as "accidents." I confess the word "accident" is very useful, but every thoughtful person is well aware that nothing is really "accidental," and we use the word as a convenient way of expressing an occurrence of which we know nothing, but the cause or motive force is behind the final results all the same. Just as I write I find an able article in the *American Garden and Forest* for August 1, p. 265, based on a Presidential address delivered before a convention of nurserymen at Detroit, by Mr. Watrons, who emphasises the fact that Apple culture in the Northwest of America suffers enormously in many localities from climatic and other causes; and this he attributes mainly to the fact that the Apple is of foreign ancestry, and not a development of a native race, as is the case with American Grapes, Strawberries, and Blackberries. In the great north-west districts we are told the seedlings from the native species of *Prunus* are fast superseding Plums of European origin. This article is well worthy of notice, containing, as it does, the germs of much successful fruit culture in America and other countries. While firmly believing that all fruits of absolutely native origin will mainly and in the long run, be found best able to withstand the erratic vicissitudes of climate in all countries, yet we must never lose sight of the fact that plants are not always found to thrive best in the places where Nature places them, and this is especially the case when plants are grown for some particularly artificial purpose or use. For example, a plant may exist naturally in a cold, northern country and exposure, and yet prove more fruitful in a warmer and more sheltered climate. The converse of this is very rarely true—there are notable examples, but they are few and unimportant as compared with the former rule. Hence I recommended the improvement of native species if possible, or of cultivated varieties of the same, or similar species, introduced from a colder and less suitable country or locality than that where they are to be naturalised. Now the Apples that have been introduced, mainly from England, Holland and Germany, often fail in America. Downing, indeed, tells us that our most noted Ribston Pippins give place in America to Baldwin, Newtown Pippin, Spitzenberg, and others raised in that country. F. W. Burbridge.

## A PROLIFEROUS STRAWBERRY.

HORTICULTURAL editors are often appealed to to interpret the conditions in the schedules of flower shows. A frequent inquiry is as to whether Rhubarb is to be considered as a fruit or a vegetable—using the latter word in a culinary sense. A similar question is often put with reference to the Tomato. No such enquiry has ever reached us as to the Strawberry; every one seems quite satisfied that that should be called a fruit, and not only a fruit, but that particular fruit called a berry. It may be read that the Almighty might have created a better "berry," but that He did not. What, then, if the so-called Strawberry be not a berry at all, and, except in a very loose sense, not even a fruit? In point of fact, the true fruits in the Strawberry are the little dry pips commonly, but erroneously called seeds, and which spring from and are more or less imbedded in the fleshy end of the flower-stalk. Usually the flower-stalk or axis, after having given origin to the

FIG. 23.—PROLIFEROUS STRAWBERRY, WITH FLOWER PRODUCED FROM THE SIDE.

several parts of the flower, ceases to grow, and disappears from sight; but in the Strawberry it swells out into that delicious succulent mass which is so nice that the partaker heeds not for a moment the botanical pedant who tells him it is not and could not be a berry. That it is really the dilated top of the flower-stalk is, however, shown on various grounds which it is unnecessary to discuss. Suffice it to say it is the office of a stalk to produce leaves, leaf-buds, shoots, or flowers, or all of them, as the case may be; and in the Strawberry before us we have three or four such buds springing from the sides of the berry, and one of them so perfectly organised as to have not only leaves (A) but adventitious roots, the commencement of a runner, (C), and a terminal flower. (Fig. 23).

## TRADE NOTICE.

MR. JOHN G. BROWN, only son of the late Mr. Matthew Brown, of the firm of Dickson, Brown & Tait, and Mr. James Wilson, late head shopman with the same firm, have commenced business as seed and bulb merchants at 10, Market Place, Manchester, under the title of Brown & Wilson.

## VEGETABLES.

### ONION CULTURE.

A GARDENER remarked the other day that "the wet summer was driving the Onions all to top." I told him that it was natural a succulent and moisture-loving plant like the Onion should grow freely during a wet summer; but so far from regarding it as an evil, I thought it indicated a good crop of Onions, provided the stock were good. That is a matter of the first importance, and I have known stocks of Onions of very indifferent quality through planting all the smallest and roughest bulbs for seed. The Onion growers of Oxfordshire—the men who produce exhibition Onions from 1 lb. to 2 lb. in weight—so far from deploring moisture for their Onions, give them an abundance. I have known them give the beds a good soaking even when rain was certain. They, as practical and successful cultivators of the Onion, give plenty of manure below and plenty of moisture upon the surface.

Togrow exhibition Onions a fairly moderate stiff and tenacious loam is the best. Onion-growers lay down the principle that the firmer the surface on which the Onions are growing the better is it for the fine development of the bulbs, especially in filling out the base, and getting it full and plump instead of hollow. A hard surface is of small moment, provided it is kept well moistened by rain or by means of the watering-pot. The soil for exhibition Onions is prepared about the month of October. A piece of ground being selected, a spit is dug out, and 6 to 8 inches in depth of good mellow manure is placed upon the subsoil, after being well forked up and loosened; then the spit from the adjoining soil is laid upon the manure, and so the work goes on until the whole piece is prepared. This is allowed to remain until January, when a good coat of soot is laid upon the surface, and it serves the double purpose of destroying insects and fertilising the Onions. In two or three days, if the weather is favourable, the surface is gently forked over, and made firm. It is then ready for the plants raised from seed, sown in pans or boxes in January, and they are transplanted to the beds. If the spring proves dry, the young plants are well watered, so that no check is received from drought, and throughout the summer no check is put upon the use of the watering-pot; and a daily supply almost is given, whether or not it promises to rain.

Top-dressing is followed by some growers, and eschewed by others. Mr. Wingrove, of Rousham Park, one of the best growers for exhibition in the present day, uses as a top-dressing manure from a spent Mushroom bed; but another, equally successful, never top-dresses, but waters abundantly.

One grower, who has to deal with a light soil of a shallow nature, uses for manure good fresh cow-dung, which he regards as more cooling and lasting, but he never top-dresses, preferring that the roots of the Onions should go downwards instead of rising to the surface, as the Onions are likely to suffer in hot dry weather in consequence, unless abundantly watered. R. D.

## PLANTS AND THEIR CULTURE.

**BULBS FOR FORCING.**—The first lots of these should now be put in. When very early flowering is desired it is much better to plant early than to subject the bulbs to hard forcing later on, as the flowers will have more substance and will last longer in a cut state if they have not been forced too much. In putting them in consideration should be given as to whether they are merely grown for the production of cut flowers or are to be used as decorative plants. If for the former purpose then boxes will be more suitable than pots. These boxes should be about 6 inches deep, and of such a length and breadth as is most convenient; but for decorative purposes pots had better be employed. A practice which largely prevails in the market trade is to first put all the bulbs in boxes, and when they have made a little growth, transferring them to pots, when, by selecting

and putting together those which are at about the same stage of development, very even nicely filled pots may be had. This method gives excellent results for market purposes, but where the longevity of the flowers is of first importance they are better grown from the first in the flowering pots, having in each lot as many bulbs as can be conveniently got in; 6-inch pots are a favourite size. In filling the boxes no more room need be left between the bulbs than is just sufficient to allow of a thin layer of soil being placed round them. In both cases the bulbs should be planted so as to be just covered with the soil, which is best when of a rich loamy nature with plenty of sharp sand in it. Avoid the use of rank or half-decayed manure in the compost; it has a tendency to cause the roots to decay.

After planting the bulbs the boxes or pots should be placed on a dry or well drained bottom, and covered over with cocoa-nut fibre refuse, coal-ashes, or similar material, to the depth of several inches. If the soil has been properly moist when the bulbs were put in, it rarely happens that watering will be required until after they are removed from the plunging material; but if it is thought they are getting too dry, a slight damping of the plunging material will be sufficient.

The bulbs which should have immediate attention are the early white Roman Hyacinths, the Paper-white and double Roman Narcissus, which, with comparatively little forcing, may be had in flower by November. Of late years Narcissi or Daffodils have come to the front, and large quantities are now forced into flower in the winter, which, in the case of the earlier sorts, such as *pallidus procerus*, may be had not much behind the Roman Hyacinths. But although pallidus procerus is exceedingly neat, early, and useful, it is in the large trumpet sections that the most noble-looking flowers are to be found—such as *Ard Righ*, *Golden Plover*, *maximus*, *princeps*, &c. The Tenby Daffodil, *obvallaris*, with its shortened trumpet and compact habit is an excellent thing for forcing. Of the bicolor section there are some splendid forms, such as *Empress* and *Horsfield*, bicolor, and the broad-leaved *Emperor* and *Ringilobus*; of whiter Daffodils there are the various forms of *moschatus*, *cernuus*, and *tortuosus*; of the incomparabilis, *Nonsuch* or *Peerless* varieties *Leedsii*, *Princess Mary*, *albidus*, and *Stella*, are well known varieties. Then there are the *Jonquilla*, *Poeticus*, and *Polyanthus* *Narcissus* groups, from which large selections might be made. If these Daffodils are got in at once, they should, if treated similarly to the Roman and Italian Hyacinths, be fit to fill their places as they go over; in any case there should be no difficulty in their being plentiful by Christmas.

**Toilets.**—Young plants which were put in in the early part of the season, and which have since been grown on in the nursery quarters, should now be placed in their winter-flowering position. If this operation is delayed much later the plants will not have time enough to thoroughly establish themselves before the dull short days are on us. A capital place in which to grow them is in an ordinary garden frame; and if a slight bottom-heat for a short time after planting can be had so much the better, a small quantity of fresh fermenting material being best. It sometimes happens that the heat has not quite gone out of the frames in which Melons have been grown; and if such can be had, they will do very well; moreover, they would not require fresh moulding over, as the soil would not be exhausted. In any case, having prepared the frames there should be not less than about 8 inches deep of good loam inclined to be heavy rather than light; spread it evenly, and make it tolerably firm. All being now ready, carefully lift the plants in the nursery, with as much soil as possible adhering to the ball of roots. Plant them firmly in rows in the frames, allowing from 6–8 inches between the rows and plants, according to their size. After planting give them a good watering, but avoid watering all over with a rough rose, as this plasters down the surface of the bed and renders it congenial to the growth of the plants—rather water them individually; and unless the weather should prove extra dry, it rarely happens that much future watering is required. If the weather be cold or wet, the sashes may be kept over them, but always giving plenty of air—indeed, if the weather is fine, the sashes may be kept off, but again putting them on as the autumn advances, until in winter very little watering or airing will be required. If they are grown in pots the treatment is practically the same—merely plunging the pots in the frames instead of planting them out; they can then be removed from

the frames as required, 32-sized pots being a very suitable size to use. The double sorts are best adapted for this purpose; perhaps the best of them is *Marie Louise*, but some prefer the white *Comte de Brazzas*, and others the Neapolitan or *Comte Violets*. *F. Ross*, *Blethingley*.

## SOCIETIES.

### ROYAL HORTICULTURAL.

AUGUST 14.—Last Tuesday's show was evidently influenced by the holiday time, as it was the smallest exhibition yet held in the Drill Hall, Messrs. Paul & Son, and Mr. T. S. Ware were the leading exhibitors before the Floral Committee, and Messrs. J. Veitch & Sons' and Mr. Walker's collections of Gooseberries were points of interest in the fruit section.

#### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. W. Wilks, J. Fraser, J. Walker, H. Herbst, W. Goldring, W. Holmes, C. Pilcher, H. Ballantyne, J. Dornay, J. O'Brien, E. Hill, G. Paul, C. Noble, and Dr. M. T. Masters.

Messrs. Paul & Son, Cheshunt, contributed a large collection of cut flowers of hardy herbaceous plants, and also nine boxes of cut Roses containing some very creditable blooms of the usual popular exhibition varieties. The blooms were of large size, well coloured, and in very fair condition. Among the best blooms were the following varieties:—*Paul Neron* (large), *Victor Verdier*, *Madame Cusin* (good colour), *W. A. Richardson*, *Bruce Findlay*, *Madame Ch. Wood*, *Comtesse de Roseberg*, and *Captain Christy*. There were several varieties of Carnations and Picotees, among which Mrs. Reynolds Hole, a terra-cotta coloured flower, stood out conspicuously. Autumn flowering Phloxes and Poppies in variety made a bright show. A mass of flowers of *Campanula carpatia* was very attractive, and so also were the flowers of *Polemonium Richardsoni* and *Arnebia echoides*. Centaureas were numerous; there were *C. macrocephala*, which makes a fine show in the border, but is somewhat unwieldy when cut; *C. ruthenica*, smaller; and *C. montana*, a very useful one. Other good plants were *Montbretia Pottii*; *Geum coccineum*, very bright; several *Potentillas*; *Harpallium rigidum*; *Oenothera speciosa*, white, very faintly suffused with rose; and *Gypsophila paniculata*, which is very useful for intermingling with more heavy flowers in borders, &c.

From the Hale Farm Nurseries, Tottenham, Mr. T. S. Ware contributed a group of cut flowers of a varied nature. The most conspicuous object was a salmon-pink variety of *Papaver orientale*, which was awarded a First-class Certificate under the name of *Blushing Queen*. There was also a specimen of the typical plant. Shirley and Iceland Poppies and Phloxes made a gay display. A *Canna*, named *Victor Hugo*, deserves attention; it is rich red, with deep red-brown spots, and the leaves are flushed with the same colour. *C. Hippolyte Flandrin* was also shown, rich yellow and orange-brown spots, and as shown of a very dwarf habit. Other noteworthy plants were *Lilium elegans*, *Batemannie*, *L. canadense*, *L. c. rubra*, *Milla biflora*, *Iris Kämpferi* var., *Monarda didyma*, *Pentstemon heterophyllus* (?), with very pretty bright blue flowers, freely produced; and *Ferraria undulata*, a singular-looking *Iris*.

G. F. Wilson, Esq., *Heatherbank*, Weybridge, showed a few interesting plants, as *Gentiana asclepiadea*, in white and blue forms; *G. ornata*, a small-flowered species, and the pretty little *Stenogaster concinna*, with Gesneria-like flowers of white with the two upper lobes of the corolla lilac; also *Lilium longifolium* and a white *Maurandya*, from the Sandwich Isles. The old-fashioned white *Rose*, *La Biche*, was represented by a large boxful of cut blooms from Mr. J. Walker, Thame. Its chief merit lies in its floriferous nature.

A few double tuberous Begonias came from Messrs. H. Cannell & Sons, Swanley, Kent. *C. Shovell* being the finest flower, it is rich rose, and the plant shown bore a flower quite 4 inches in diameter, of very fine form. Mrs. Cornwallis West, rich yellow flushed with salmon on the centre segments; and Mr. F. Jenkins, pale sulphur, were also good forms.

From the Royal Gardens, Kew, there were sent *Mucuna imbricata*, a leguminous plant, which was shown at South Kensington last year and attracted

considerable attention, with its racemes of large purple-black flowers (about 2 inches in length); *Pereskia bleo*, with pink Rose-like flowers not frequently seen in bloom; *Eucomis bicolor*, green, edged with purple, and the stem spotted with the same—a very pretty flower; *Littonia modesta* was also shown.

Mr. C. Turner, Royal Nurseries, Slough, showed a stand of Carnations and Picotees, exhibiting well grown flowers; *Terra Cotta*, *Annie Douglas*, and *Dorothy* being the best blooms.

A collection of numerous varieties of *Iris Kämpferi* came from Mr. W. Gordon, Twickenham, embracing a great range of colour, and all of large size. One of a purple-lilac colour, and another similar but with a white centre to each segment, were good. Also *Coquette*, rich blue; *Red Gauntlet*, white, with lilac margin; and *The Bride*, pure white. He also had *Lilium Leichtlinii*.

*Lælia elegans* was sent by Malcolm S. Cooke, Esq., Kingston Hill (gr., Mr. Culmimore), with two spikes of richly coloured flowers.

*Odontoglossum crispum*, *Heaton variety*, a form with large brown spots, was sent by Mr. J. Charlsworth, Heaton, Bradford. He also had *Bifrenaria cornuta*.

The new hybrid *Cypripedium* *Charles Canham*, recently fully described in our columns, came from Mr. Cowley, gr. to F. G. Tautz, Esq., Studleigh House, Shepherd's Bush, W. The sepal is green-brown with a white margin, petals lilac-purple with a hairy edge, lip green with brown suffusion, the flower being of good size.

Messrs. H. Low & Co., Clapton, showed two small *Cypripediums*, one called *C. concolor*, *Regnierii* and the other *C. c. unicolor*, pure pale yellow; and a well flowered plant of *Oncidium splendidum* came from J. C. Rafter, Esq., Castle Hill, Englefield Green, Staines (gr. Mr. W. Swan).

Messrs. R. P. Ker & Sons, Aigburth Nursery, Liverpool, sent *Croton Aigburth Gem*, which resembles *interruptus*, but is rich crimson with green blotches, while the young foliage is yellowish; it is a very pretty new *Croton*, justly deserving the certificate awarded. A similar award was made to Messrs. J. Laing & Sons, Forest Hill, S. E., for a Carnation, *R. H. Elliott*, yellow ground with rich crimson flakes, and good in form.

Mr. W. Williams, Walcot Nursery, Ryde, sent two good border Carnations. Mr. G. Davidson, Ammanford, South Wales, showed a white *Lobelia*; Miss Hope, a large-flowered sort, of tall habit; and a blue-and-white one, a sport from *Bluebeard*—came from Mr. T. Williams, Devizes. Mr. R. Dean, Ranelagh Road, Ealing, showed *Phloxes*, *Stocks*, *Carnations*, &c., the *Mauve Beauty*, double *Stock*, showing very well, and *Rosa alba* was a delicate rose *Phlox*.

Messrs. J. Cheal & Son, Crawley, Sussex, had a wire frame suitable for displaying a bunch of single *Dahlias*, *Narcissi*, &c.

#### FIRST-CLASS CERTIFICATES.

*Papaver orientale* var. *Blushing Queen*, from Mr. T. S. Ware.

*Croton Aigburth Gem*, from Messrs. Ker & Son.  
*Carnation B. H. Elliott*, from Messrs. Laing & Mather.

*Begonia C. Shovell*, from Messrs. H. Cannell & Sons.

#### MEDALS.

*Silver-gilt Banksian*.—To Messrs. Paul & Sons, for collection of cut flowers.

*Bronze Banksian*.—To Mr. T. S. Ware, for collection of cut flowers.

#### Fruit Committee.

Present: T. F. Rivers, Esq., in the chair; and Messrs. W. Warren, R. D. Blackmore, G. W. Cammings, J. Cheal, J. Lee, W. Marshall, A. H. Pearson, J. Smith, and J. Wright.

Messrs. J. Veitch & Sons, Chelsea, showed a collection of about a hundred dishes of Gooseberries, also a few cordon trees in fruit, and a few dishes of other fruit, as *La Constante* Currant, very large; *Citron des Carmes* Pears, *Waterloo* Strawberry, *Early Julien*, *Irish Peach*, and *Red and White Junceating Apples*. Of the Gooseberries it is difficult to select any for special mention. We laid before our readers last year illustrations and remarks on a selection of the best varieties, most of which were shown on this occasion. The fruits were remarkably clean and plump. Some of the best examples shown were Ironmonger, London, Warrington, Yellow Champagne, Railway, Telegraph, Thumper, Pitmaston Green Gage, Village Gage, &c.

Mr. J. Walker, Thame, and Messrs. Paul & Son, Chesshant, all each contributed an extensive collection of Gooseberries composed of the favourite varieties.

A box of eighteen very fine examples of Peach Royal George were shown by Mr. J. Chambers, Westlake Nursery, Isleworth.

An instance of the effects of manuring on Apples was shown by Mr. W. Rouppell, Rouppell Park, S.E., who had the Gladstone Apple in its ordinary form—green with red mottling, and again of a bright red colour, the latter fruit being from a tree to which a dressing of soot and lime had been applied; both were grown on the Paradise stock. Red Juneating and Early Harvest were also shown, the latter a bright green round Apple of medium size.

Messrs. J. Cheal & Sons had specimens of Fay's Prolific Currant, a large red fruit, very freely produced. W. M. Baker, Esq., Hasfield Court, Gloucester (gr. Mr. Asplin), and Mr. Cap. gr. to Mr. W. G. Blair, Northcroft, Englefield Green, each showed Melons. Pea Mitford Hero, came from Mr. T. Bunyard, Poplar Hill, Horningsea, Cambridge, a large pod, well filled.

From the Society's Gardens, Chiswick, were sent three varieties of Figs, which were De la Madeleine, Beau d'Anges, and Pein d'Or, all good fruits. Plum St. Etienne and Prince of Wales, Cherry Madeleine and Montmorency à courte queue, and Apples Red and White Astrachan, and White Transparent, all being capital examples.

#### MEDAL.

*Silver Banksian*.—To Messrs. J. Veitch & Sons, for collection of Gooseberries.

#### COLD STORAGE OF FRUIT.

At the conclusion of the sitting a special sub-committee was appointed to investigate the effect of cold storage on fruit, the following gentlemen being nominated:—Messrs. J. Lee, T. F. Rivers, J. Wright, J. Smith, Dr. Hogg, W. Marshall, H. J. Veitch, J. Cheal, D. Tallerman, and A. F. Barron. The experiments and investigations are to be carried out in connection with the Leadenhall Market Cold Storage Co., Limited (D. Tallerman), 79½, Gracechurch Street, E.C. This is an important phase of fruit marketing, and one which the Society does well to investigate.

#### THE OXFORD CARNATION AND PICOTEE UNION.

This exhibition took place as usual in Mr. E. S. Dodwell's garden in the Stanley Road, Oxford, and proved to be of much more extensive and satisfactory a character than was anticipated. There were a large number of flowers staged for competition, and while many exhibited the effects of the season, there were yet some very fine blooms, many of the Picotees being fine and highly finished. Mr. Dodwell stated that a very abnormal growth had been experienced under very abnormal conditions, and he in the whole length of his experience, never remembered such a July as that of the present year. A much larger tent than is usual was required to accommodate all the flowers, and in addition, Mr. Dodwell had something like 3400 pots in his Carnation-houses in glorious bloom, including a great many new yellow grounds of rare promise. The judging over, a party of some sixty persons sat down to luncheon in Cowley St. John's High School, under the Presidency of the Mayor of Oxford—a good number of ladies being present. In the evening the usual meeting of subscribers was held, and the lines laid down upon which the Union should proceed in 1889.

*Carnations*.—In the class for twelve blooms of Carnations, dissimilar, flakes and bizarres, eight prizes being offered, there were eleven competitors. Mr. Martin Rowan, Manor Street, Clapham, being placed 1st with a remarkably good lot, considering the season, the blooms reading from left to right as follows:—S.B. Robert Lord, P.E.B. Sarah Payne, S.E. John Whitham, R.F. Jessica, C.B. Master Fred, S.B. Fred, P.B. George Melville, P.P.B. Ridenham, S.E. Thomas Tomes, P.P.B. William Skirving, S.B. Admiral Curzon, and R.F. Rob Roy. 2nd, Mr. J. Lakin, Temple Cowley, also with some fine flowers, consisting of P.F. Sarah Payne, S.F. Tom Lord, C.B. Captain Owen, very fine; S.H. Robert Lord, S.F. Seedling, R.F. Sybil, S.F. Alderman Buckell, P.P.B. Dr. Symonds, C.B. Master Fred, S.B. Admiral Curzon, P.P.B. Joseph Lakin, and S.B. Robert Houlgrave; 3rd, Mr. R. Sydenham, Birmingham; 4th, Mr. George Chaundy, Oxford; 5th, Mr. W. L.

Walker, Reading; 6th, Mr. Arthur Brown, Birmingham.

In the class for six blooms of flakes or bizarres, dissimilar, there were eighteen competitors for nine prizes, and here Mr. Tom Lord, Todmorden, was 1st, with R.F. Sybil, P.F. James Douglas, C.B. J. D. Hestall, S.E. William Mellor, C.B. Master Fred, and S.B. Robert Lord. 2nd, Mr. C. Phillips, Reading, with P.F. James Douglas, S.F. Alisemond, a very promising flower; R.F. Rob Roy, S.B. Admiral Curzon, S.B. Robert Lord, and C.B. John Harland. 3rd, Mr. John Whitham; 4th, Mr. W. Bacon, Derby; 5th, Mr. C. Henwood, Reading; 6th, Mr. S. Barlow, Manchester.

*Picotees*.—In the class for twelve blooms, dissimilar, there were eleven competitors, and here Mr. M. Rowan was 1st, with a very good lot, though some of the blooms showed signs of roughness. The varieties were H. Rose E. Mrs. Payne, L.P.E. Clara Penon, H. Red E. Mrs. Dodwell, L. Rose E. Nellie, H.P.E. Muriel, H. Rose E. Edith D'Ombraun, L.P.E. Jessie, H. Scarlet E. Mrs. Sharpe, L. Rose E. Thomas William, H. Red E. J. B. Bryant, L.P.E. Elsie Grace, and H.P.E. Alliance. 2nd, Mr. Joseph Lakin, with H. Scarlet E. Mrs. Sharpe, L.P.E. Jessie, L. Rose E. Orlando, H.P.E. Zierlin, L.P.E. H. Rose E. H. Rose E. Seedling, H. Red E. Brunette, H. Rose E. Seedling, H.P.E. Amy Robart, H. Rose E. Seedling, L.P.E. Ann Lord, and H. Red E. Mrs. Dodwell. 3rd, Mr. R. Sydenham; 4th, Mr. George Chaundy; 5th, Mr. A. Brown; 6th, Mr. W. L. Walker.

In the class for six blooms there were twenty exhibitors for nine prizes; here Mr. Tom Lord was 1st, with fine blooms of H. Scarlet E. Mrs. Sharp, H. Red E. Mrs. Dodwell, L. Rose E. Mrs. Gedge, L.P.E. Mrs. Gorton, H.P.E. Amy Robart, and L. Rose E. Miss Gorton. 2nd, Mr. John Whitham, with H. Red E. John Smith, L. Rose E. Miss Wood, L.P.E. Ann Lord, H.P.E. Alliance, H.P.E. Tinnie, and H. Rose E. Lady Holmesdale. 3rd, Mr. J. Payne; 4th, Mr. A. W. Jones; 5th, Mr. Thomas Bowyer, 6th, Mr. J. S. Hedderley.

*Sels, Fancies, and Yellow Grounds*.—There were ten stands of twelve dissimilar blooms in competition for eight prizes, the best coming from Mr. W. Reed, gr. George Dodwell, Esq., Oxford, who had very fine blooms of The Maestro, crimson, flaked with maroon—very fine; Queen of the West, pink; Glady's, pink—very fine; Heroine, scarlet; and some very fine seedling fancies and yellow grounds. 2nd, Mr. Martin Rowan, with Sir Tony Belch, scarlet, flaked with maroon; Annie Douglas, Joe Willet, scarlet; Celia, pink; Prince of Orange, Imperator, purple; The Governor, Rev. Markham Hill, pale scarlet and maroon; Eurydice, deep rose and maroon; Mrs. Genge, pink; Black Knight, maroon; and Glady's, pink. 3rd, Mr. George Chaundy; 4th, Mr. Joseph Lakin; 5th, Mr. W. L. Walker; and 6th, Mr. R. Sydenham.

*Single Blooms*.—Carnations.—Of these there were large quantities, and the judges had a severe task in awarding the prizes. Scarlet Bizarres.—1st, 2nd, 3rd, 4th, and 5th, Mr. Samuel Barlow, with fine blooms of his new S.B. Robert Houlgrave.

Crimson Bizarres.—1st, Mr. T. Lord, with Master Fred; 2nd, Mr. J. S. Hedderley, with the same; 3rd, Mr. C. Phillips, with John Harland; 4th, Mr. P. E. Henwood, with Seedling; 5th, Mr. M. Rowan, with Master Fred.

Pink and Purple Bizarres.—1st, Mr. C. Phillips, with Faust; 2nd, with Duc d'Aumale; 3rd, with William Skirling; 4th, Mr. M. Rowan, with the same; 5th, Mr. P. Anstiss, with Seedling.

Purple Flakes.—1st, Mr. Hill, with James Douglas; 2nd, Mr. T. Lord, with Squire Trow; 3rd, Mr. J. Whitham, with James Douglas; 4th, Mr. R. Storror, Stranraer, with Sarah Payne; 5th, Mr. C. Henwood, with the same.

Scarlet Flakes.—1st, Mr. J. S. Hedderley, with Sportsman; 2nd, Mr. C. Phillips, with Alisemond; 3rd, Mr. J. Lakin, with Mrs. Carter; 4th, Mr. W. L. Walker, with Alisemond; 5th, Mr. J. S. Hedderley, with Sportsman.

Rose Flakes.—1st, Mr. J. Lakin, with Lovely Mary (new), and 2nd, with the same; 3rd, Mr. M. Rowan, with Mrs. Bridgewater; 4th, Mr. T. Henwood, with Rob Roy; 5th, Mr. M. Rowan, with the same.

Sels.—1st and 2nd, Mr. J. Lakin, with Emma Lakin, a grand pure white self; 3rd, Mr. A. Brown, with Emily Francis, a fine rose self; 4th, Mr. R. Dean, with Germania, yellow self; 5th, Mr. A. Brown, with Emily Francis.

Fancies.—Mr. J. S. Hedderley, with sport from Master Fred, rose, flaked with maroon; 2nd, Mr. W.

Reed, with Maestro, scarlet and maroon; 3rd, Mr. Reed, with Mrs. Dodwell, rosy-pink and maroon; 4th, Seedling of similar character; 5th, Mr. J. Bridgewater, with Dr. Guinness, rose and maroon.

*Picotees*.—Heavy Red Edge.—1st, Mr. J. Payne, with Brunette; 2nd, Mr. T. Lord, with Dr. Epps; 3rd, Mr. J. Payne, with John Smith; 4th, Mr. W. L. Walker, with the same; and 5th, with Dr. Epps.

Light Red Edge.—1st, Mr. C. Phillips, with Thomas William; 2nd, Mr. J. S. Hedderley; and 3rd, Mr. M. Rowan, with the same; 4th, Mr. Rowan, with Mrs. Gorton; 5th, Mr. Phillips, with Elsie Grace.

Heavy Purple Edge.—1st, Mr. Reed, with Amy Robart; 2nd, Mr. J. Bridgewater, with Muriel; 3rd, Mr. T. Anstiss, with Pollie Brazil; 4th and 5th, Mr. M. Rowan, with Muriel.

Light Purple Edge.—1st, Mr. Rowan, with Baroness Burdett Coutts; 2nd, Mr. C. Phillips; 3rd, Mr. J. S. Hedderley, with Ann Lord; 4th, Mr. Hedderley, with Baroness Burdett Coutts; 5th, Mr. C. Phillips, with Mary.

Heavy Rose Edge.—1st, Mr. M. Rowan, with Mrs. Payne; 2nd, Mr. J. P. Sharp, with Mrs. Sharp; and 3rd, with Campanian; 4th and 5th, Mr. Rowan, with Mrs. Payne.

Light Rose Edge.—1st and 2nd, Mr. T. Anstiss, with Favourite; 3rd, Mr. R. Sydenham, with the same; 4th and 5th, Mr. M. Rowan, with Nellie.

Yellow Picotees.—1st, Mr. W. Reed, with Queen of Hearts; 2nd, with Alfred Gray; 3rd, with Alfrida; 4th and 5th, with Seedlings.

The premier Carnation was S.B. Robert Houlgrave, shown by Mr. S. Barlow; the premier Picotee was H. Rose E. Mrs. Payne, shown by Mr. M. Rowan; the premier self Emma Lakin, shown by Mr. J. Lakin; and the premier fancy The Maestro, shown by Mr. Reed.

Special prizes were awarded to Mr. Reed, for a stand of twelve yellow ground Picotees of Mr. Gyles Kilmerry strain, in which the flakes of colour are laid on in longitudinal markings; and twelve of Mr. E. S. Dodwell's own seedlings, in which the colour is laid more upon the petal edges.

A stand of very fine blooms of the following yellow grounds were shown by Mr. Charles Turner, Royal Nursery, Slough, viz. Colonial Beauty, Almira, Dorothy, Agnes Chambers, Annie Douglas, and Terra Cotta, four blooms of each being shown.

*New Flowers*.—First-class Certificates of Merit were awarded to Mr. Joseph Lakin for White Self Mrs. Lakin, and to the same for R.F. Lovely Mary, a seedling from Lovely Ann; and to Mr. Arthur Brown for Pink Self Emily Francis (Johnson); to Mr. J. S. Hedderley for Carmine Self Royalty; and to Mr. Thomas Anstiss for H.P.E. Picotee Pollie Brazil, raised by the exhibitor; to C.B. Carnation, John Harrison, a seedling from E. S. Dodwell, raised by Mr. W. M. Hewitt, of Chesterfield; fine petal and colour, and a good grower.

#### EXCURSION OF THE ROYAL SCOTTISH ARBORICULTURAL.

A LARGE contingent of the members of this Society left Edinburgh on the 8th inst. for Jedburgh. The numbers were increased in the progress of the journey, till a party of between forty and fifty mustered for breakfast in the "Spread Eagle" Hotel, Jedburgh. Among the party were Dr. Cleghorn, St. Andrews; Mr. James Watt, Carlisle; Mr. M. Dunn, Dalkeith Palace Gardens; Mr. John Methven, Edinburgh; Mr. Caverhill, factor Monteviot; R. V. Kyrke, Esq., Penryn, Mold; Mr. R. A. Meikle, factor, Chrichel, Wimbore, Dorsetshire; Mr. D. F. Mackenzie, factor, Morton Hall, Midlothian; Mr. G. Dodds, Wentworth; Mr. J. M. Forsyth, Woburn Abbey; Mr. J. Kay, Rothsay; Mr. J. Robertson, Paisley; Mr. Baxter, Dalkeith; Mr. Erskine, Edinburgh; Mr. Buchanan, Penicuik; Mr. Milne, Edinburgh; Mr. A. Clark, Linlithgow; Mr. C. M. Paterson, New Battle Abbey, &c.

Breakfast over, the party, under the guidance of Mr. Walter Laidlaw, custodian of Jedburgh Abbey, inspected the ancient remains of the abbey, and other points of historic interest in this border burgh. Jedburgh, like most other of the early ecclesiastical centres, is somewhat famous for its fruit trees. One ancient Pear tree in the convent garden, which was formerly attached to the abbey, continues to bear good crops of fair fruit, although it is alleged to be about 300 years old. Many other features of interest to those of archaeological bent were pointed out by the guide, but arboriculture being the chief object

the party had in view, the programme admitted of only a brief stay in the town.

Passing up the Jed Water the attention was directed to Lintlee, where the Earl of Richmond attacked Sir James Douglas with 10,000 men, but the latter turned the sweeping and plant branches of the Birches which abounded in Jed Forest to excellent account as a means of defence. Twining them together athwart from stem to stem the enemy's horse were thrown into confusion and easily routed. Very little of the old forest remains, the most notable relics of it being found on the estate of Ferniehurst, the property of the Marquis of Lothian, before reaching which, however, the party passed through the estate of Linlathgow, belonging to the Earl of Howie. Here were found some remarkable specimens of Black Italian Poplar, common Spruce, and Larch. The Poplars are said to be 110 years old; the tallest is 125 feet in height, with a girth of 13 feet at 3 feet from the ground. The largest Spruce, which girthed 10 feet, is eighty-five years old.

On the Ferniehurst estate two of the most remarkable relics of the ancient Jed Forest are found. Both are Oaks, and are named respectively "The Capon Tree" and "The King of the Wood." The latter is about 78 feet high, with a girth of 16 feet 6 inches, and is estimated to contain about 300 cubic feet of timber. The former, the top of which suffered considerable damage by the snows of the winter of 1872, has a girth of 28 feet 6 inches at 3 feet from the ground, and at 5 feet from the ground 24 feet 3 inches. At another point of the estate are some Lime trees of peculiar character. They are large, wide spreading trees, growing in a group of six, with an average girth of 16 feet 6 inches, and an average height of about 93 feet. But the most remarkable feature about them lay in the fantastic character of their huge lower limbs which, striking out horizontally beyond the line of the upper branches, rise perpendicularly with considerable bulk and weight of timber. In other parts of Ferniehurst clumps of Birch and Oak of considerable age are pointed out as remains of the ancient forest of Jed, but appear rather to be the suckers that may have sprung from the stools of the original trees than those themselves.

Leaving Ferniehurst, Howden Burn was next visited, where some fine Scots Firs were inspected, the largest of which girthed 8 feet 8 inches, and was 80 feet high—the bole clean and straight to 50 feet high.

Hartridge, the seat of Lord Stratheden and Campbell, was next visited. Among the many fine trees in the park were noted a grand specimen of Scots Fir, with finely-balanced bulbated head, the bole girthing 10 feet 6 inches. Near the mansion-house some Oaks were found to girth 13 feet 10 inches, and some Hornbeam girthed 7 feet 10 inches.

On leaving Hartridge the party drove on to Monteviot, the beautiful and extensive seat of the Marquis of Lothian. Here lunch was provided for the party by Lord Lothian, which, in the absence of whom, was presided over by Mr. Caverhill, his lordship's agent. A letter from Lord Lothian was read by Mr. Caverhill expressing his lordship's regret that he could not personally receive the visitors. After lunch the party proceeded to inspect the extensive park, and its wealth of trees and shrubs.

The river Teviot winds eastward through the park a little to the south of the mansion, its banks adorned with widespread lawns, shrubbery, and flower gardens, all in good taste, and enriched with grand clumps and individual specimens of the usual classes of park trees. The greater part of the plantations are comparatively young, having been planted by the present Marquis and his predecessor, while the late Marchioness also contributed largely to the development of the picturesque beauty of the place by her excellent taste in arboriculture.

Among the more interesting specimen trees noted was an Abies Pinsapo on the terrace west of the mansion, supposed to have been planted about twenty-five or thirty years ago, the bole of which girthed 5 feet 9 inches, and the height was 38 feet. An Abies nobilis in the flower garden, of about the same age as the last named has a girth of 5 feet 1 inch, and is 50 feet high; and near by this stood a grand A. Douglasii, having a spread of branches of 35 feet, and a height of 47 feet. These three Conifers are of the same age. A remarkable Weeping Ash in the same part of the grounds had a spread of branches of 30 feet, and a height of 20 feet.

The visitors returned to their hotel to dine, being much impressed with the picturesque scenery they

had witnessed during the day, particularly with the extensive panorama they viewed from the top of Peniel Heugh, a lofty eminence within Monteviot Park, which commands a magnificent view of the valleys of the Teviot, the Tweed, and the Jed, and seven of the border counties, including that of Northumberland.

The company dined in the "Spread Eagle" Hotel, Jedburgh, Dr. Cleghorn in the early part of the evening occupying the chair, Mr. James Watt succeeding on his retirement. Messrs. Dunn and Kyrke acted as croupiers. Among the topics discussed at the dinner Mr. Watt alluded to the disposal of the surplus still lying in the hands of the Executive Council of the Edinburgh Industrial Exhibition of 1886. The Council had apparently a difficulty in deciding what to do with the surplus, which amounted to several thousands of pounds, and he suggested that it should be put to establishing a Forestry School in Edinburgh.

Leaving Jedburgh the following morning the excursionists drove to Ancrum, the seat of Sir W. Scott, Bart., a finely timbered park of limited extent where some remarkable Limes, Elms, purple and common Beech, and other ordinary classes of park trees abound. Several Limes were remarkable for their dimensions. The largest had a girth of 18 feet 11 inches, and the smallest girth was 15 feet. These, with their mighty spreading tops of 80 or more feet, were considered by the arboriculturists worth a day's march to see.

Leaving Ancrum, a drive of about 7 miles along the banks of the Teviot, brought the party to the "Craggs" entrance to Minto grounds, the seat of the Earl of Minto. Here there were no relics of old forests to excite the curious in tree lore, but there was to be found instead, on every hand, to the extent of about 1000 acres, as grand evidence of arboriculture as is to be found in the South of Scotland. The park is one of the most picturesque of a most picturesque county. The chief attraction in the woodlands were the Larches, which here, alike in numbers and in size, rival the famous Larches of Dunkeld, Perthshire. The older trees are in the beautiful glen which traverses the park from north to south. They were planted in 1736, the greatest girth taken was 12 feet 1 inch, the greatest height 135 feet, with about 80 feet of clear, almost untapered stem. Younger trees on other parts of the estate, of about eighty years of age, promise by their luxuriance and health to perpetuate the fame of Minto for its Larches. But many other kinds of trees thrive equally well here. To give dimensions would be tedious, but some magnificent Silver Firs should not be passed over. The largest of these girthed 11 feet 9 inches, and was 120 feet in height.

From Minto the party passed through Denholm Den, a beautiful wooded glen, by the southern bank of the Teviot, on to Cavers, the seat of Captain Pomer Douglas, and thence to Hawick where they took tea, and several of the excursionists returned to their respective destinations.

At Cavers one notable Ash was pointed out, which is locally known as the "Pope Tree." It is said to be 300 years old, and is 16 feet girth, the top, however being much mutilated.

### TRENTHAM HORTICULTURAL.

JULY 26.—This Society held its first annual exhibition in Trentham Gardens, by the kind permission of the Duke of Sutherland. Although many years ago the horticultural exhibition at Trentham was among the first events of the kind in the northern part of the county, in recent times the show had been abandoned. This season a new Trentham Horticultural Society was formed, and met with very favourable support. The Marquis of Stafford became its President; the Duke of Sutherland, Lord Ronald Gower, Duchess of Sutherland, and others became patrons. The weather, after a somewhat threatening morning, was fine in the afternoon, and between 7000 and 8000 persons attended. On entering the marquee the visitor was struck by the groups of ornamental foliage and flowering plants, arranged for effect, which ran along each side of the marquee, and terminated at the end with a fine collection from Trentham Gardens, including a display of choice Orchids, which were disposed among Ferns. Other groups also contained fine plants, and considerable taste had been shown in the arrangement, one of the most conspicuous being that of W. Thompson, Esq., Walton Grange, Stone, who had good Orchids. In the cut flower division the chief feature was the

Roses sent by Messrs. B. R. Cant, Colchester; stands of Carnations and Picotees came from Mr. Charles Turner, Slough. Messrs. Laing & Sons, Forest Hill, contributed a selection of Begonias and Caladiums, &c. Mr. Blair, Trentham Gardens, was mainly instrumental in organising the Society, and he also managed the show.

### PLANT PORTRAITS.

ANEMLANCHIER OLIGOCARPA, *Garden and Forest*, July 18.

ANHELTONIUM LEWINII, Hennings, *Gartenflora*, August.—A Mexican Cactaceae plant with very thick fleshy root, contracted stem, tufted succulent leaves, with spines at the tip, surrounding a dome-shaped flower-stalk, with numerous pale rose flowers. The whole plant measures only about 3 inches across.

APPLE RED ASTRAKAN, *Bulletin d'Arboriculture*, July.

BEGONIA GERANIODES, *Bulletino della R. Società Toscana di Orticultura*, July.—Natal. Acaulescent, flowers white.

BEGONIA GLOIRE DE LUCERNE.—*Illustrierte Monatshefte*, July.—A cross between Begonia Frederick Schlegel and B. corallina.

CATTLEYA HARRISONIÆ VIOLACEA, *Orchid Album*, t. 333.

CATTLEYA WARNERI, *Revue de l'Horticulture Belge*, August.

CHERRY, ROYALE HÂTIVE (EARLY ROYAL), MAY DUKE, *Bulletin d'Arboriculture Belge*, August.

CYPRIPEDIUM AMESIANUM (VILLOSUM X VENUSTUM), *Orchid Album*, t. 340.

DENDROBIUM FYTCHEANUM ROSEUM, *Orchid Album*, t. 336.

DENDROBIUM MACROPHYLLUM, *Orchid Album*, t. 339. HABRANTHUS NEWALLII, *Garden*, August 4.

HOULETTIA BROCKLEHURSTIANA, *Orchid Album*, t. 337.

ODONTOGLOSSUM VUYSTKEANUM, *Orchid Album*, t. 334.

PELOX STELLARIA, *Garden and Forest*, July 25.

POLYGONUM BALDSCHUANICUM, Regel, *Gartenflora*, t. 1278.—A climber; leaves cordate, ovate, acute; flowers numerous, small, pink, in branching panicles. Native of Bokkara.

ROSE, LOUIS VAN HOUTTE, H.P., *Revue de l'Horticulture Belge*, August.

SCHOMBURGIA UNDULATA, *Orchid Album*, t. 335.

VANDA LAMELLATA BOXALLI, *Orchid Album*, t. 338.

ZYGOPETALUM BRACHYPETALUM b. STENOPEPETALUM, Regel.—A variety differing from the type in its narrow segments and five-ribbed disc.

### COLONIAL NOTES.

#### QUEENSLAND.

ROCKHAMPTON BOTANIC GARDENS.—The establishment of the botanic gardens was contemplated from the time when the town was first surveyed, as the original plans show various sites were set apart for gardens and public parks. In 1872 the reserve of 100 acres, with a frontage to the Murray Lagoon, was selected as the most suitable. The lagoon ensures a permanent supply of good water, and the soil is light sandy loam, of good depth, and very easily worked. The then Premier, now Chief Justice of Queensland, Sir Charles Lill, approved of the selection, and has always taken an interest in the progress of the gardens. At a meeting of trustees held in September, 1873, the present Superintendent, Mr. J. S. Edgar, was appointed. A few weeks afterwards a contract for fencing was let, the clearing of the land of the indigenous scrub was commenced at the same time, and within a short period 6 acres were cleared and securely fenced. This piece has been used for nursery and experimental work, tropical fruits and economic plants generally receiving special attention. So far the results have been very gratifying. Most of the valuable fruits of

the Tropics find a congenial home in our climate. Mangoes—of which there are over twenty varieties in the gardens—and many other trees bear good crops annually.

As soon as the nursery had been well started, the general clearing and laying out of the reserve was taken in hand. Most of the ground was heavily timbered, with scrub underneath, which made the clearing a tedious and expensive affair. The funds at the disposal of the trustees not being sufficient to clear it all at once, tracks for the main avenues were cleared and planted with suitable trees. The row of Bunya Bunya (*Araucaria Bidwillii*) on each side of the centre walk are well grown trees for their age. Some of them have already reached a height of 40 feet. The Banyan (*Ficus bengalensis*) in twelve years have a spread of branches 60 feet in diameter. The finest sight in the gardens is undoubtedly the avenue of Cocoa-nuts (*Cocos nucifera*), in fruit, with stems from 10 to 20 feet high. The leaves meet overhead. The parallel borders in which they are grown are 20 feet wide, and are closely planted with Crotons. Between 400 and 500 plants were required to fill the borders. The shade given by the leaves of the Cocoa-nuts is sufficient to preserve the bright colours of the Crotons during the hot summer months. There are about forty varieties in the collection, and when in full leaf the display is very much admired by visitors. Large sheds have been erected, and covered with 3x1 inch hardwood battens, 2 inches space being left between each. In these plant-houses all plants can be grown for which hothouses are required in colder climates. The only glass structures in use are a few propagating frames.

To fresh arrivals from Europe during our winter and spring months it is always a matter of surprise to see home vegetables and their favourite annuals growing side by side with Mangos, Jack Fruit, Pine-apples, Tamarinds, Cocoa-nuts, Coffee, Bananas, &c.; yet each year is proving more clearly that there are few annual plants of the temperate zone of commercial value that cannot be grown in Central Queensland during the cool season.

Fruits of tropical and subtropical countries have been well tested. Appended is a list of the most prominent that have been successfully fruited. [A list of about fifty tropical fruits was appended, which the limitations of our space forbid us from printing. Ed.]

The majority of these fruits are best adapted for the coast country. The finest Grapes are grown inland at elevations of 1000 feet and upwards. Large areas on the Peak Downs, Springen, and on the Drummond range, are well suited for the cultivation of the Grape Vine. The winter is cold enough to allow the plants to go to rest in the season for two or three months, which they never do near the coast. In these inland districts good Peaches, Nectarines, Apples, and Pears have been grown, but no systematic experiments have been made to find out the varieties of these fruits best suited to the climate. Unless the Government take up the matter, and start small experimental gardens on some elevated position inland, not much progress will be made in this direction. There is not the slightest doubt that Grapes, Peaches, Nectarines, Apricots, American Plums, Pears, Apples, Date Plums, Quinces, and other fruits can be grown in Central Queensland, but a large amount of experimental work will have to be done to find out the right sort to plant, and the proper site to plant them in. Coffee, Arrowroot, Tapioca, Ginger, Olives, and many more plants of commercial value, grow easily here, but the high prices of labour will prevent their cultivation to any extent for some time. Fifty species of Palms have been introduced into the gardens. Some of the first planted are fine specimens. In a few years the collection of Palms will be one of the features of the place. *Rockhampton*.

## THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHRISWICK DURING THE WEEK ENDING AUGUST 25. (AVERAGE OF FORTY-FOUR YEARS.)

## THE PAST WEEK.

The following summary record of the weather for the week ending Aug. 13, is furnished from the Meteorological Office:—

"The weather has continued cold, rainy, and unseasonable in the north-western and northern parts of the kingdom, but in all other districts a decided improvement has taken place, fine and dry conditions being generally prevalent.

"The temperature has again been below the mean in 'Scotland, N.' and 'Ireland, N.' but in most of the other northern and western districts it has just equalled the mean, while over the eastern, central, and southern parts of England, it has varied from 1° to 3° above. The highest of the maxima, which were recorded in most places, either on the 9th or 10th, ranged from 85° in 'England, S.' and 'England, E.', and 84° in the 'Midland Counties,' to 79° in 'England, N.E.' and the 'Channel Islands,' and to between 67° and 77° elsewhere. The lowest of the minima, which were registered on somewhat irregular dates, ranged from 39° to 49° in Scotland, and from 44° to 51° over England, while in Ireland

the minimum was 48°, and in the 'Channel Islands' 52°. During the night of the 9th–10th the thermometer did not fall below 63° at several of our southern and south-eastern stations, while in London the minimum was no lower than 65°.

"The rainfall has been rather more than the mean in 'Scotland, N.' and 'Ireland, N.' but considerably less in other districts. Over eastern, central, and southern England the fall has been very slight.

"Bright sunshine shows a decided increase over the greater part of England, but a decrease over Ireland, Scotland, and the west of England. The percentage of the possible amount of duration ranged from 8 to 15 in Scotland, from 18 to 28 in Ireland, and from 27 to 45 over England. In the 'Channel Islands' the percentage was 57."

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

BEGONIA: *D. M. C.* Your flower had withered when we received it; but, so far as we can tell, there are many better.

BUNCH OF GRAPES: *R. H. P.* Seeing that the growth is from one eye we should consider it to be one bunch.

CARNATIONS: *C. Lorenz.* In spite of the elaborate way in which they were packed, these arrived utterly shrivelled. A layer of moss should have been placed over the flowers. Cotton-wool, though so generally adopted, we look on as the worst possible packing material. Another time please to address the Editor.

CARNATIONS (SEEDLING): *W. W.* A very good lot, varied in colour, of good size and form.

CHISWICK: *T. H.* There is no difficulty in obtaining admission. Make yourself known, and you will be admitted. Strangers, and non-gardeners, pay 6d. for admission. You may cut your Aucubas now; do not delay too long.—*W. C.* If you make yourself known as a gardener you may be admitted without fee on any day except Sunday; otherwise you may have to pay 6d.

FUNGUS: *B. G.* The Giant Puff-ball (*Lycoperdon giganteum*). We suspect the heavy dressing of pig-manure with the tan was the cause of the decay of the Rhododendrons. We do not think the fungus is the cause of the malady. If a slice of the fungus be taken when it is still snow-white, and fried in batter, it will be found to have a very delicate flavour. It is quite harmless, but must not be eaten if at all discoloured.

INSECTS: *Southampton.* The insects found in considerable numbers in a lately-built house as very destructive, are a small species of the numerous family of Longicorn beetles. They are named *Obrium minutum*. Please send any further particulars to Professor Westwood, Oxford, W.

NAMES OF PLANTS: *D. T.* 7, *Potentilla agropyrophylla*; 8, *Geranium sanguineum* var.; 9, *Scabiosa columbaria* var.; 10, *Achillea ptarmica*.—*C. A. L.* 1, *Stachys betonica*; 2, *Verbascum lychnitis*; 3, *Digitalis grandiflora*; 4, *Cephalaria tartarica*; 5, *Digitalis lutea*; 6, *Inula helenium*.—*W. E.* *Dianthus libanicensis*; *Helichrysum angustifolium*.—*E. Cooper.* *Iris Robinsoniana*, and *Fuchsia venusta*.—*Sir J. W.* 1, *Pterocarya caucasica*; 2, *Cladrastis tinctoria*, alias *Virgilia lutea*; 3, *Syringa Emodi*; 4, *Abies nobilis*; 5, *A. magnifica*.—*G. W. W.* *Rubus chamaemorus*.—*J. A. M.* *Hymenocallis littoralis*, *Salix*. *Zeylanicum* and *maritimum* belong to *Pancratium*; the other species you mention to *Hymenocallis*. The two genera are quite distinct in fruit and seeds. *J. G. Barr.*—*J. M. D.* 1, *Dendrobium Phytocnemum*; 2, *Aerides maculosum*.—*W. A. G.* 1, *Adiantum concinnum latum*; 2, *A. concinnum*; the name formerly given was a misprint; 3 has a resemblance to an erect form of *A. decorum*, but it may

be the variety you mention.—*H. James*. Numbers detached. *Jasminum revolutum*—yellow flower, climber; shrub with lilac bract is *Leycesteria formosa*; small yellow flower with much divided leaf is *Corydalis alba*; hardy shrub, *Hibiscus syriacus*, *altiss* *Althaea frutes*.—*T. K. & Co.* *Richardia*. Double spathed forms of *Arum* (don't call it a Lily!) are not uncommon. The Poplar seems to be the common *Aspen* (*P. tremula*).—*Mrs. E. Asperula cynanchica* (*Rubiaceae*), closely allied to the Bed-straws (*Galium*), common on limestone downs.—*E. C.* *Broughtonia sanguinea*.—*J. T. D.* *Euphorbia Lathyris*.—*L. J.* *Spiraea arifolia*.—*L. and B.* 1, *Melica nutans*; 2, *Aira flexuosa*; 3, *Juncus maritimus*; 4, *Carex vesicaria*; 5, *Juncus lamprocarpus*, Ehrh.; 6, *Carex sylvestris*; 7, *Sesleria cernua*; 8, *Nardus stricta*.—*E. J.* *Potentilla*, we cannot name from the specimen sent, send more material and leaves.—*C. W. D.* *Allium macranthum* (*N. America*).—*J. Morton*. *Aschillea ptarmica*, *Calystegia sepium*, *Erigeron speciosus*.—*F. Dunn*. *Francoa ramosa*.—*J. H.* 1, *Zelkova crenata*; 2, *Rubus odoratus*.—*G. W.* Wild Mignonette, *Reseda lutea*, *Linaria spuria*, *Medicago echinus*, and *Berteroa incana*.

PEAS: *J. H.* A malformation, due to the union of two or more stems.

PELAGIONUM NOT FLOWERING: *Inquirer*. Without knowing the treatment given, we cannot say for certain why your plant has not flowered. Probably it has had too much water and too little sun, like many other plants this year.

PINK ESCHOLZIA: *X. Y. Z.* There is such a variety in which the outer surface of the petals is rose-coloured.

RASPBERRIES: *J. W. B.* A fair average crop would be about  $\frac{1}{2}$  to  $\frac{1}{3}$  ton per acre; or on land of very superior quality, and in a good season, as much as  $\frac{2}{3}$  tons per acre. *W. B. C.*
